In the year of our Lord 1274, there was a certain Noble woman in the Bishoprick of Roffing. which brought forth a childe like to a Lione's in all parts, but it had the skin of a man : Unto this di couried may add the Images of Lions, both in Temples, and also upon shields; and first of all in the Temple where the shield of Agamemon hung up. (as Pancennius writeth) there was the pidus (Fear,) drawn with a Lions head, because as the Lion fleepeth little, and in his fleep his eyes be open; fo is the condition of Fear; for we have shewed already, that the Lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound and the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sound as the lion when he sleepeth had been a sleepeth had be his eyes open, and when he waketh he fhutteth them, and therefore the Ancients did fymbolicilly nicture of a Lion upon the doors of their Temples, and upon the Ships also, in the fore-part of Calier. them, they ingraved the figure of Lions, according to this faying of Vivul: Anthologius.

> --- Aeneia puppis Prima tenet rostro, Phrygios subjecta Leones.

It was also a usual custom to picture Lions about Fountains and Conduits, especially among the Egipilans, that the water might fpring forth of their mouths, Quoniam Wilus avva Egipti novan aquam invebit, sole transeunte Leonem; because that Nilus did over flow the fields of Egypt, at what time the Sun paffed through the fign Leo. Therefore also the River Alpheus was called Leonties porot, the Lions fountain, because at the heads thereof, there were dedicated the pictures of many Lions. There was a noble Harlot called Leana, which was acquainted with the tyrannies of Har- Varinus. modius, and Aristogiton; for which cause she was apprehended, and put to grievous torments. to the intent she should disclose them, but she endured all unto death, never bewraying any part of their counsel: After her death, the Athenians devising how to honour that vertue, and Paulanias. because she was a Harlot or common Curtizan, they were not willing to make a statue for her Atheneus in the likenels of a Woman, but as her name was Leana, that fignifieth a Liones, so they ere-Aed for her the picture of a Liones; and that they might express the vertue of her secrefie, they caused it to be framed without a tongue. Upon the grave of Last, there was a covering containing the picture of a Lion, holding a Ram in his fore-feet by the buttocks, with an inscription that a Lion held the Ram; so do Harlots hold their lovers, which Alciatus turned into this Epigram:

> Quid scalptus sibi vult aries, quem parte Leans Unguibus apprensum posteriore tenet? Non allter captos quod & ipfa teneret amantes, Vir gregis est aries, clune tenetur amans.

There was also a Lion at Delphos, which weighed ten talents of gold; and at the entrance of Thermopila upon the Tombe of Leonides the Captain of the Spartans, there stood a Lion of stone : Upon the steps of the Capitol of Rome, there were two Lions of black Marble touch-stone. And the Agricola. Cyclent ingraved upon one fide of their money the picture of a Lion, and on the other fide the face of a woman. King Solomon built his Ivory Throne upon two Lions of Brais; and upon the steps or fairs alcending up to that Throne were placed twelve Lions, here and there. And from hence it came. that many Kings and States gave in their Arms the Lion, Rampant, Passant, and Regardant, difinguished in divers colours in the fields of Or, Argent, Azure, and Sables, with such other terms of Art. The Earth it felf was wont to be expressed by the figures of a Lion; and therefore the Image of Altress was supported with Lions. Cybele the Eligned Goddels of the Mountains was carryed upon Lions. And it is faigned that the Curetes, which nourished Jupiter in Creet, who was committed to Opplanus. Lions. And it is raigned that the chieffer, which mountained payares them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who Breerwards by Jupi- ("Planus, them by his mother Rhea, by the anger of Saturn; were turned into Lions, who be the saturn of the saturn mwhen he reigned, were made the Kings of beafts, and by him enjoyned to draw the Chariot of his Mother Rhea, according to this verse;

Ei junthe currum Domina Subtere Leones

There is a constellation in Heaven called the Lion, of whom Germanicus writeth in this fort, that he The constellais the greatest and most notable amongst the fignes of the Zodiack, containing three stars in his tion of the Lihead and one clear one in his breaft, and that when the Sun cometh to that figne which happeneth in co. the month of July, at which time the vehement heat of Summer burneth the earth, and dryeth up the Rivers. And therefore because the Lionis also of a hot nature; and seemeth to partake of the substance and quantity of the Sun, he hath that place in the Heavens. For in heat and force he excelleth all other beafts, as the Sun doth all other stars.

In his breatts and fore-part hois most strong, and in his hinder-part more weak, so is the Sun, turreafing until the noon or fore part of the year, until the Summer, and afterwards feemeth to languish towards the setting, or later part of the year called the Winter. And the Lion also seemeth always to look up with a fiery eye, even as the Sun which is patent with the perpetual and infatigal fight upon the earth. The Lion alfo is a fignification of the Sun; for the hairs of his made do refemble the streaming beams of the Sun, and therefore this constellation is styled with the Macrobius. Ame Epithets thatithe Lion and the Sun'are, de hear-bearing seftive, ardent, avent, calent, hot, flammant, burging, Hierculean; mad, horrible, dreadful, cruel, and terrible. It is feigned of the Poets, that this Lion was the Nemean Lion flain by Hercules, which at the commandment of Juno was fostered in Arcedia, and than in anger against Hercules after his death, she placed him in the heavens, it close a drob a drob in To conclude this flory of the Lions, it is reported of the Devils ralled Onofeels, that they there themselver sometimes in the shapes of Lions and Dogs, and the Dog of Berapis, which was seigned to have three heads, on the left fide a Wolfs, on the right fide a Dogs, and in the middle a Lions. We have shewed already, that the people called Ampraciate, did worship a Lioness,

de Linx.

Lions normhed because the killed a Tyrant. And the Egyptions builded a City to the honor of Lions, calling it Lean-Lions normled December in Street, and dedicating Temples to Vulcan for their honor. And in the porches of Heliopolu, there in Temples, & topolu, and dedicating Temples to Vulcan for their honor. were common Hipends for the nourishing of Lions.

ere common repenus for the nouthing of allowing the Beef, and have also windowes in their lodgings.
As in other places where they are fed daily with Beef, and have also windowes in their lodgings. As in other places where they are less than for their recreation and exercises: with an opini-with great Parkes and spaces allotted unto them for their recreation and exercises: with an opiniwith great rarkes and spaces another direct and worship them, should see a speedy revenge, on that the people that came unto them to offer and worship them, should see a speedy revenge, on that the people that came unto them to one that had wronged them by perjury, or broken the oath

To conclude, in holy Scripture we finde that our Saviour Christ is called the Lion of the tribe of fidelity. of Judab; for as he is a Lamb in his innocency, so is he a Lion in his fortitude. The Devil also is or jugan; tot as he is a Lamb Lions in their hunger are most of all full of sury and wrath. And so called a roaring Lion, because Lions in their hunger are most of all full of sury and wrath. And so called a roating Lion, because Lions with that Emblem of Alciette, describing how little Hares I will conclude and end this flory of Lions with that Emblem of Alciette, describing how little Hares did rejoyce and leap upon dead Lions:

Eacida moriens percusu cuspidia Hetter, Qui tolies boftes vicerat ante (uos; Comprimere haud potuit vocem infultantibus illis,

Dum curru & pedibus nellere vincla parant. Diftrabite ut libitum eft : fic ooffi luce leonis Convellant barbam vel timidi Lepores.

The medicines of the Lian.

Albertus. Sextus.

The bloud of a Lion being rubbed or spred upon a Canker, or upon a fore which is swelled about the bloud of a Lion being rubbed any pain cure and ease the grief thereof. Whosever doth the veins, will presently and without any pain cure and ease the grief thereof. Whosever doth the veins, will presently and without any danger travel amongst anoint his body all over with the bloud of a Lion, may safely and without any danger travel amongst any wilde beafts what soever.

The flesh of a Lion being eaten either by a Man or Woman which is troubled with dreams and fantasses in the night time, will very speedily and effectually work him ease and quiet-ness. The same also being boyled or baked, and given to them which are distraught of their wits to eat, doth bring them ease and comfort, and renew their wits again : it is also very good for the pains of deafness or the ears. And being taken in drink, it helpeth those which are troubled with the shaking of the joynts or the Palite.

. Wholoever shall have shooes made of the hide oriskin of a Lionor Wolf, and wearthem upon his feet, he shall never have any pain on ach in them. They will and defend him that useth them from the Gowt, or fwelling in the feet or legs. The skin or bide of a Lion is also very good for either Man or Woman which are troubled with the piles or swelling of the veins, if they shall but at fome feveral times fit uponiter and to the Art. Co

The fat of a Lion is reported to be contrary to poison, and venemous drinks, and being taken in Wine, it will by the fent expell all wilde Beafts from any one; and it doth also resist and drive away the fent or finell of Serpents, by which they follow men to deftroy them. Wholever doth anoint his body all over with the tallow or fewet of the reins on kidney of a Lion, thall by the fent and favour thereof expell and drive away from him all Wolves, how greedy and ravenous

A Man being throughly anointed with the grease of a Lion being melted, doth drive away from him and put to flight any living creature whatfoever, and alfo wenemous and pollonous Ser-

If any wilde Beaft be anointed with the tallow on fewer of a Lion which is diffolzed and clapents themselves. rified, he shall neither be troubled with the stinguing of Flies or Bees. The fat or greate of a Lon being mingled with Oyl of Rofes doth keep the skin of the face free from all blakings and blemthes, being annointed thereupon, and doth alfo preferve the whiteness thereof, and being mingled with Snow-water, doth heal any fieth which is Burnt or feorched upon a man, and doth alfo cure the fwelling of the joyntace of the hand good goods of and other or gracing in

The fewer or fat of a Lion being mingled with other ointmense, and anoidted upon the places of either Man or Woman who have any blemishes in any part of their bodies other presently expell the same. The same virtue, hath the dung or dirt of a Lion being mixed with the

The greate of a Lion being diffolved and prefently again conglutinated together, and to being anointed upon the body of those who are beauties. ing anointed upon the body of those who are heavie and fad, it will speedily excit pate all fortow and grief from their hearts. The fame also being mised with the marrow of a Hab and mith Lettice, and so beaten and bruifed, and afterwards midgled all together, is an excellent rendy against the dividing of the Newscand Country and the chartest and the chartes the firinking of she Nerves and finews, and the achieves the bonds and knuckles abquitible kgs, be the property of a way I wanter by Hack ing anointed thereon.

The greafe of a Lion by it felf only, mixed with aixoreain ointment id also very profitable to en pell the Gowt. The same being mingled with Oyl of Roses, doth ease and help those which are troubled dayly with Aguekvand Quartern Fevers. The I same also being histoired and powered into the ears of any one which is troubled with any painin them; will prefeatly, free his with the constant some and sol

There is also in this Lions grease, another excellent virtue which is this, that if the lawbone of any one be swelled and anointed over with this grease being melted, it will very speedily avoid the pain thereof.

The fat or fewet of a Lion being melted and mixed with certain other things, and so miniftred unto any one that is troubled with the wringing of the bowels, and bloudy flux in the nitred unto any one that is troubled with the wringing of the bower, and bloudy hux, in the fame manner as a glyffer is used, is commended for an excellent remedy for the same. The same also being mingled with a certain Oyl and warmed together, and anointed upon the head of any one, whole hair doth shed, or is troubled with the Foxes evill, doth immediately belp and sure the table. The seed of a Hare being mixed with the fat of a Lion, and anoin-Galented upon the privious manufacture of any one, will stir and incitate them up to that how chast soever

they shall be.

The far of a Lion minuted with the far of a Been whit melted conscious, being another Myseffit.

upon the belly, doth allay and allwage the hardness choroof, as also any other pain as grief in

The brains of a Lion, as also of a Cat, being taken in drink, doth make him and unto whom it is given. The falling being mingled with some small quantity of Old of Spike, and powred or ditilled into the cares of any one which is deaf or thick of hearing, will represent the cares of any one which is deaf or thick of hearing, will represent the cares of any one which is deaf or thick of hearing, will represent the cares of any one which is deaf or thick of hearing.

If the eye teeth of a Lion be hung about the neck of a young childe helper that he call his Rafis. teeth, and the beginning of his second or new teeth, they will keep him for ever from having anyach or pain in them. The heart of a Lion being beaten into finall powder, and taken in drink, doth very speedily cure and heat those which are troubled with Agues or Quarrain

The liver of the Lion being dryed, and beaten to powder, and put in the purest wine which is pliny, possible to be gotten, and so drunk, doth take away the pain and grief from any one which is troubled with his liver.

The gall of a Lion being taken in drink by any one, doth kill or poison him out of hand. But Betrutius, some do impute this yenom to be in the gall of a Leopard. The gall of a Lion being mixed with pure water, and anointed upon the eyes of any one, will take away the blemishes thereof, and cause them to see clearly: and the fat of the Lion being added thereunto, is an excellent remedy against the Falling sickness. A very little part or dram of the gall of the Lion being put in Albertus. wine and fo drunk, will speedily help and cure those which are troubled with the Yellow Jaundife. The same disease is also cured by yellow Carets being stamped and put in wine, and so given in drink.

For the fores or blemishes in the eyes, the gall of a Lion being mingled with Hony, and so anoin- Galen. tedupon them, is commended for a very special and effectual cure or healing. The gall of a Lion, aBear, or an Ox being mixed with certain other unguents, is very much used for the extending or moving forward of conception.

The right from of a Lion being beaten together with Boles, attention frained hard untill some Rafit. liquid juyce or water doth proceed from them, and so taken in drain adoth make that party barren unto whom it is given; it hath the like effect in it, if it be say in alther roasted or broyled, or raw and bloudy.

The fat which proceeded from the privity or feerer parts of a the Lion being put in a Actius, veffell made of Ivory, and to being temperately mollified is commended for a very effectual and

Rafit.

Of the LINX.

The picture of a Linx once in the Tower of London, which was first described by Doctor Cay.

The names of the Linx.

He wilde Beaft which among the Germans is named Luchis, by making a name from the Line, or as others write Luce, or Luces: amongs the Indians is at this day called Lupe of will, or Caret. rlo, being engendered betwixt a Hinde and a Wolf; and likewise amongst the Rhetiant which speak Italian vi and the Subaudians, and the Dalmatians or Hyridns, Cervire Butthere was a certin Bobmie of late, which declared that the Linguage de conjectured; was called among the Hyrians, Ross (and the it was called Luchf among the Gendand but that amongst the Upridaciwas leffer then the other, in very like. The Spaniards do as yet call him by the Latin name Lince, even as certain Italian writen in their vulgar tongue, as Alunna doth testifie. Incertain places in Helvete, and about Stand they call him Thierwolf. Amongst the barbarous writers he is called by the name of an Ounce; which Ido suppose to be a Pamber. Fr. Alumm doth say, that this Beast was called of certain Italian writer in the vulgar tongue, Lonza, fome interpreting it to be a Lioness, some a Pardal, a Panilot, of a Wolf, engendred of a Hinde and a Wolf.

Of the Lingui Ounces do commonly feem to be called rather Linnes then Panthers; but although lome late Bellonius writers do attribute the name to a Leopard or a leffer Panther, it feemeth notwithftanding corrupt

วและราช ค.ศ. 1 การการ ค.ศ. ใช้การ์การ

from the Linx : for he is a creature very like him both in his craft and shape of his body, but a Linx bath his tail shorter, and his longer. Liberds bane doth kill Leopards and Linux.

Avicenna.

Thefe Figures were taken by Olaus Magnus, wherein the Linx pursuell a wilde Cat.

The Laim call this beaft Lupus Cervarius, and Lynx of the Greek word Lugar, from whence the Gar- Thereasin of man, ein Lucht: and it hath been believed, that the Latin name was given unto it, because they were the Latin ingendred betwixt a Wolf and Hind, but there is no wife man that will suppose or be easily induced names, to believe, that Beafts of such hostility, and adverse dispositions in nature, should ever ingender or suffer copulation together; and therefore I rather suppose that it is called Gervarius, either because it hunteth Harts and Hinds, or elfe because it imitateth their young ones in the outward colour and

There was a Beaft (faith Pliny) which was called Cham, and by the French, Raphlus, brought in publick spectacle by Pompey the great, out of France, which in shape resembleth a Wolfand in foots aleopard; and therefore I think that Chaus, Raphim, and Lupm Cervarius, are divers names of one and the fame wilde Beaft, and yet by divers writers it is confounded with the Thees, or with the Panther or with the Ounce.

But I cannot agree thereunto, feeing it is written by Pliny, that about the River Padus in kuly. there are certain Beafts called Lynces, from whence cometh the Lyncurton, which by Zenothomia are called Lange, and by others Langurie. And Solinus also agreeth thereunto, taking Lupus Gervarius, for a kind of Linx.

Some have fabled that there is a Beast called Lyncem, which Suidm and Various call Onurderches: Two kinds of and they fay, that the eyes of it are the best fighted of all the Beasts in the world. Oppians maketh Linxes, two kind of Linxes, one a greater, and hunteth Harts and great Beafts; the other a smaller, and hunteth wilde Cats and Hares. And first of all I will fet down the description of this Beast, seconding asit was taken in England by that learned Physician D. Cay, whose words I do here expresse.

There is in the Tower of London (faith John Car) a Bealt which dateth fleth, his whole body be- A flory of a ing of the greatness of a Lamb of two moneths, old, having his head, mouth, feet, and natis like to Linx by D.

a Cat. But concerning his heard and tail, his heard hangeth down on both sides, divided in the Cay, taken in a Cat. But concerning his beard and tail, his beard hangeth down on both fides, divided in the England by middle with fundry colours, the former being white, and the latter black , his tail is fhort and thick, the fight of being from the middle to the uppermost pract red, and to the lower part black; his eyes being yet, this beattin low, the hair of the eye-lids obscurely waxing white. His ears erected upright, as the eyes of a the Tower. Cat, being replenished within with white hair, without covered with white and black, but to that the upper part is black, the middle (for it is divided into three parts) be white, and the lowest black again. Neither is it content to be onded in his own course, except also that his former parts, or the farthest brinkes or edges, and also his latter may be bended on the other fide, in like manner as the edges of the Priests hat of the Grecian Church are folded amongh the Venetians.

In the top of his ears there are placed some black hairs, as it were a foretop or tust. The colour of this beaft in the outmost parts is red, in the innermost white, but sprinkled here with black foots, and almost by rows, and there with spots somewhat lighter then the other, all his hair being for the most part white all over : all his body, except the aforesaid spots, as it is in certain black skins of young Conies. And on both the fides of his nofe there are four spots set in order. In both his lips, as now we will declare : in his uppermost lip there are five orders or rowes, being of a very equall distance.

In the first row, and the upper, four ; in the second, five ; in the third, eight ; in the fourth, five . in the fift, there are four; and these also every one in his order, having an equal distance. In the ower lip there are only seven more manifest and evident, being placed in two rowes. In the first four, to the very mouth of the lip; in the second after them three others; after these, other leffer but not placed with so certain and true order as the uppermost.

In the upper lip on both fides there are certain white hairs being rougher then those in Catsand. Lions. His nose is fornewhat of a pale red colour, being somewhat distinct or apart from the rest rest of his face on every side with a black line. Another line also doth divide the outermost part of his nose by length (as in an Ounce) but only being lightly lead by the top or highest parts, not im-

pressed higher by the lowermost. The skin of his feet are exceeding hard, and his nails are hid in his feet (as the nails of an Ounce and a Cats are) neither doth he put them forth at any time, unleffe in taking of his prev

He doth climb wonderfully, so that what he may be able to do in that thing (either in his cave or den) nature her felf doth teach. He is a quick-moving creature, and cannot stand still in a place, fo that except (by meer chance) the voice of a Wood-pecker in the basket of a certain Countrey man (who came then only to fee the Lions) had made him quiet and attentive, there had been no hope of the portraiting out the picture of his body. He being present he was most quiet; but he going away, he would never stand still: wherefore I was constrained to fend my man after the Countreyman to buy the bird, which being present, he stood very still untill the business was dispatched and the work absolutely perfected.

Our Countreymen call it Luzarne, it is doubtful whether we should call it Leunce, or Lnnz. in the affinity of the words. His skin is used by Noble men, and is sold for a great price. He is angry at none but them which offer him injury; his voice is like a Cats, when he would fratch away the food from his fellow. He is loving and gentle unto his keeper, and not cruell unto any

by the fight of

man. So far Dollor Cay. Unto this description of Doctor Caim, I may add another description that was taken by the fight feription taken of the skin of this Beaft. The length whereof from the tip of the nose unto the very tail, was four spans and five fingers, and the length of the tail seven fingers, the breadth of the shoulder-blades of his back, and the top of his neck, was two palmes fix fingers and a span; the length of his forelegs, a span and five fingers; and the length of his hinder-legs, a span and three fingers; the hair was very fost, but yet thick and deep, the tips of the hair upon his back were white, but in the neathermost parts they were red, and they are most white which fall downwards on both sides from the

In the middle they are more red and duskie, the middle of the belly, and especially the lower part is white, but both fides of it are white and red, and every where upon his belly there are black spots, but most plentiful in the bottom of the belly, and on both sides. The uppermost part of his neck, right over against his ears, hath great black spots, his ears are small, and not bigger then a little Triangle, in the edges they are black, although with the black hairs there are mingled some white. His beard is mixed with black and white hair, which hair is great like to briftles. The teeth are most white, and the upper canine teeth hang over the neather the breadth of a finger, whereof fixare small, and of those fix two are the greatest, and all the residue are very small on the neather chap; and to conclude, all the teeth were like a common Weafils or Martil. His feet were very rough, being five distinct claws upon the fore-feet, and four upon the hinder, which claws were very white and Tharp.

The price of a Countries of Linxes.

The tail was of equall bigness and thickness, but in the tip thereof it is black. These skins are fold for three Nobles a piece, and fometimes for fix, and fometimes for leffe, according to the quantity of the skin and Countrey wherein it is fold. And unto this description do Bellonius and Bonara agree. For Bellonim at Constantinople faw two Linxes, much like unto Cats : and Bonarus had oftentimes feen them hunted in Moschovia, Lituania, Polonia, Hungaria, and Germany; but he commendeth above all the Linxes of Scotland and Swefia, as most beautiful, having Triangular spots upon their skins. But the Indian and African Linxes, he faith have round spots, sharp-bristly short hair, and full of spots on all parts of their body, and therefore they are not so delicate as the Linxes of Europe. which with good cause he conjectureth to be the Linx that Pliny speaketh of, and not unlike to that which is bred in Italy. There are Linxes in divers Countries, as in the forenamed Ruffia, Linania, Polonia, Hungary, Germany, Scotland, so also they are most abundant in Scandinavia, in Swifia, so also about Hyelfus, and Heifingia: likewife in all the Regions upon the Alper, and in Sylva Maril, they are also very plentiful in Etbiopia, in France and Italy, about the River Padus, and in the Island Carpathin. And thus having discoursed of their Countrey and proportion, whereby their differences and kinds may be discerned, we will leave every one of them to their particular, and proceed to the treatile and description of their general natures.

There is no great difference betwixt their outward shapes and proportion, for both the smaller hape and feve- and the greater have bright eyes, divers coloured skins, a little head. a nimble and chearful face, and (Albertu faith) that their body is longer then the body of a Wolf, but their legs shorter, mistaking the Linx for the Theer. Their eyes stand forth of their heads very far, their tongue like the congo of a Serpent, and Textor affirmeth that they have paps or udders in their Breafts, but surely he taketh Lynx for Sphinx.

Their meat goeth into the belly straight through the maw, without staying, and therein is a note of their infatiable voracity, for none but infatiable Beafts or Birds are fo affected, as in Birds. the Comment. It hath no ankle bone, but a thing like unto it; the nails are very long, as you may fee in two of the former pictures, but he hideth them within his skin till he be angry, ready to fight or climb, or otherwise affected, as you may see by the picture of the Linx taken in the Tower of London.

The inward proportion and anatomy of their bodies is like unto a man, and therefore Galen giveth this lefton to ftudents in Physick, Praftat similarum bomini quam simillimarum artus diff care cum te in exemplo exercere institues, sin ea non detur, aliquam et proximam deligito, dat si nulla omnimo Simia reperiatur, Cynocephalum, vel Satyrum, vel Lincom, summatim ea ormia, quibus attuum contrema in digitos quind; discreto funt ; that is to fay, It is good to diffect those bodies which are likelt to a man, when one would inftruct himself in Anatomy, and if he cannot finde an Ape, let him take a Baboon, a Satyr, or a Linx, and generally any creature, the extremity of whole finews and joynts are divided into five fingers or toes.

There be some that have thought, that Panthers, Pardals, Linnes, or Tygers, had been all of the kinde of Cats, because of mutual resemblance in the greutnes, and strength of their nails, in the distinction of their skins, which are party coloured and thir, having also a round head, a short face, a long tail, a nimble body, a wild mind, and get their meat by hunting : but herein I leave every man to this own belt liking and opinion: for when we have done our best to expresse their natures and several properties, it shall be idle to spend time about disputation to what rank or order every beaft ought to be referred. For every one that readeth our story, and seeth our pictures may either be satisfied, or else amend our labour.

The Linx therefore biteth most cruelly and deep, and therefore is accounted, Rapax animal, inflar Theastions lupi led callidim, a Beaft as ravening as a Wolf, but more crafty ; they get up into trees, and from and difrofitithem leap down upon very great beatts, and destroy them, being enemies both to men and beafts, ons of Linges. and at their pleasure, according to necessity, set upon both. and at their pleasure, according to necessity, set upon both.

They are taken fometimes in Germany, in the Dutchy of Werlinberg, and that it was once credibly The place of affirmed, one of them leaped down from a tree upon a Countrey man, as he paffed under the fame their abode. tree, but being weary, and having an Ax on his neck, received her on the sharp edge thereof, and

fo killed her, otherwife the would foon have killed him. They live in the mountains alfo, where they are killed by poifon, or elfe hunted by armed men Their meat of on Horse-back, and included with multitudes, for their hunting is perilous, and therefore they food multbe inclosed with great company. Some take them with ditches, as we heard before Lions weretaken; others in snares or gins laid upon the rocks, and stones, and whensoever they are hunted with Dogs, they run directly to the woods or to the next trees, wherein they are killed

In the Summer time they are very weak and live among the Rockes, never straying far from the rown lodging, hurting no man untill the Autumn. They hunt wilde Goats, whom they followfrom Rock to Rock, leaping as fast or faster then the Goats. They hunt allo wilde Cats and low from Nock to Nock, scaping as latt of safet the first funt Harts and Affes, and their man-Hares, and some other little Beafts; but the greatest Linxes bunt Harts and Affes, and their manner is, as we have faid already, to get up into trees, and there to lie in wait for their prey, untill they espyitunder the boughs, and then suddenly lead into the neck thereof, whether it be a Man or a great Beaft, wherein they fix their claws fo falt, that no violence can shake them off, but wielt the tharpness of their teeth, bite into the feull, and eat out the brains, to the utter destruction of the Man or Beaft, whom foever they light upon, but fit be a finall Beaft, they eat the whole body thereof, and not only the brains.

Yet this is a wonderful facret in their nature, that although they be long afflicted with hunger. A fingular of when they eat their mean if they hear any notife, or any differ thanks their thanks their theory about about yet when they eat their meat, if they hear any noise, or any other chance, cause them to torn about funcis. from their meat, out of the fight of it, they forget their prey notwithstanding their hunger, and Pliny. go to seek another booty, never remembring that which they had before them, nor yet return back Solinus. again to eat thereof. The voice of this Beaft is called by a speciall word in Lalin, Oreare, or Coreare, which I may English Croaking, or Whinling, for the voice thereof is not great, and therefore the Author of Philomela faith . Duan Lincel beando fremunt, urfut ferm uncat ; While the Link croakth, the wilde bear whineth. And Arlumn faith, Cordre vox lupt Cervarit; to ctoak is the voice of The voice of

It is thought that of all Beafts they fee most brightly', for the Poets faign, that their eye fight pierceth through every folid body, although it be as thick as a wall; yet if you offer unto it any Linxes. the first is transparent, it is much offended, and sometimes blinded, but I cannot tell, whether the light be attributed to the Linx truely according to nature, or fabuloufly in imitation of the Pottical fiction of Lyncew, of whom it was faid in ancient time, that he faw through frone wals, of whom Horace writeth thus: .

> Si posses oculo, quantum contendere Lynceus, Non tamentdelteo contemnas lippus inungi.

Marcus Tulius also faith in this manner, in the admiration of Lyncens eye-fight, as though darkness Orpheus. did not hinder it, Quis est tam Lynecus qui in tantis tenebris nibil offendat ? Apollonius faith, that fo

Lynceus.

Theogritus.

Caliw.

Palephaius.

N. Spreng. Their urine and tears or weeping. Urine congealed into a medicinal stone.

great was the perfection of this mans eye-fight, as he was believed to fee perfectly down into the great was the perfection of this main cycling. I that he could fee through trees and rocks. Paulania; earth, and what was done in Hell. Pintarch faith, that he could fee through trees and rocks. Paulania; earth, and what was a King, and raigned after Danaovita. Pyndarus writeth, that Ida and Lynceus The fables of were the fons of Aphareus, and that a contention growing betweet Ida, and Caftor, and Pellus at The fables or were the folia of Apparent, and the Poets about the marriage of Helena because they twain would have ravished Phabe and Illayra, the wives of life the Poets about the marriage of Helena because they twain would have ravished Phabe and Illayra, the wives of life and Lyncess , Ida did therefore flay Caffor, and afterwards Lyncess flew Pollux when he spyed him lie and Lyncent; tas que therefore may capter, and attenuated Jupiter flew Ida with lightning, and placed under an Oake, from the mountain Taygette. Wherefore Jupiter flew Ida with lightning, and placed under an Oake, troin the mountain and placed Caster and Pollux in heaven among the stars. There was another Lynceus husband of Hyperomestra, Daughter of Danans, which Danans having commanded all his Daughters in the night time to kill their Husbands, the only spared her husband Lynceus. But the truth is, that Lynceus of whom there is so many fables of his eye-fight, was the first that sound out the mines of Gold, Silver and Brasse in the earth, and therefore fimple people feeing him bring Gold and Silver out of the earth, and coming now and then upon him while he was digging deep for it, using the light of Candles, which he never brought out of the pits, they foolishly imagined, that by the light of his eyes he was first of all led to feek for those treasures, and from hence came the common proverb, Lynces perfication, for a man of excellent eye-fight. And to conclude, others fay, that Lynceus could fee the new Moon the same day or night that she changed, and that therefore the same of his eye-fight came so to be celebrated, because never any mortali man saw that fight, himself excepted. And from these fables of Lynceus came the opinion of the fingular perspicacity of the Beast Linx : of whom as I faid before, as the fight is very excellent, and fo far excelling men (as Galen faith) like as is also the fight of Eagles, fo I do not hold any fuch extraordinary and miraculous fense to be in this beak, after any other manner, then the Poets did faign it to be in Lynceus, except as before faid, Omnes imbeil. liere sumus cernendi potestate, si aquilarum & Lyncia acuminibus conferamur. And therefore the proverb before spoken of, may as well be applyed metaphysically to the Beast Linx, as Poetically to the man Lynceur; and so much may suffice for the fight. It is reported also that when they see themselves to be taken, they do send forth tears and weep very plentifully. Their urine they renderall backwards, not only the female but the male also, wherein they differ from all other Beatts: andit is faid of them, that they knowing a certain virtue in their urine, do hide it in the Sand, and that thereof cometh a certain pretious stone called Lyncurium, which for brightness resembleth the Amber, and yet is so congealed and hardned in the fand, that no Carbuncle is harder, shining like fire, wherewithal they make fealing Rings, which caused Ovid to write thus;

Victa racemifero Lyncas dedit India Baccho, E quibus, ut memorant, quicquid vefica remifit Vertitur in lapides, & congelat aere tallo.

But they say that of the male cometh the fiery and yellow Amber, and of the female cometh the white and pale Amber. In Italy they call it Langurium, and the Beast Languria, and Lange. This Lyncurium is called of some Electrum, Pterygophoron, and they say it is the same which will draw unto it leaves, straw, and plates of Brasse and Iron, according to the opinions of Diocles and Theophrasius, and that being drunk out of water is good for the stomach, and very convenient for the flux of the belly, according to Diofcorides ; and that it cureth the pains of the reins, and healeth the Kings evill, according to Solinus: And Theophrasius goeth about to establish this opinion by reason, and laboreth to perswade it as probable, that the urine of a Linx should congeal into a stone among fand, as well as the urine of a man, to ingender a stone in the reins or in the bladder.

And of this opinion is Pliny, Theophrafius, Hespehius, Varinus, Zenethimia, Plutarch, and Aristelle. But in my op nion it is but a fable: For Theophrafius himself consessed that Lyncurium, which he calleth Lyngurion, and Amber Huales, is digged out of the earth in Lyguria. Sudines and Metrodorus fay that there is a certain tree in Lyguria, out of which Amber is taken, and this tree is the black Popler, and it is also very probable, that seeing this Amber was first of all brought into Greece out of Lyguria, according to the denomination of all strange things, they called it Lyngurium after the name of the Countrey, whereupon the ignorant Latins did faign an etymology of the word Lyncarius, quest Lyncis urinam, and upon this weak foundation have they raifed that vain building; and for further demonstration of this truth, Diofeorides faith in his discourse of the Popler, that it growing shout the River Etidanus, fendeth forth a certain humor like tears, which groweth hard, whereof they make that which is called Elearum, being rubbed, it fmelleth fweet, and for that it hath not only power to draw unto it Braffe, Iron, and fuch things, but also Gold, it is also called Chrysophoton; unto this Lucianus subscribeth : and whereas it was faid that in Italy this Amber-stone is begotten, seer the River Padus, where stand many white Poplers; my conjecture is, that some such like himor may iffue out of them, and not only by accident, but through affinity of nature, and condensate into frone, which the people finding, covered in the fand under the trees, and through their former perswasion, might casily take it for the stone engendred by the urine of the Linx.

Hermolaus allo writeth this of the Lyncurium, that it groweth in a certain stone, and that it is a kind of Mustrom, or Padfoole which is cut off yearly, and that another groweth in the room of it, a part of the root or foot being left in the stone, groweth as hard as a flint, and thus doth the stone energic with a natural fecundity: which admirable thing, (faith he) I could never be brought to believe, until I did eat thereof in mine own house.

Of the Linx.

Eugx (as it is recited by Sylvaticm) faith that the urine of the Linx, dimi fervatus, general optimes fungos supra je quetannie, reserved at home in ones house, bringeth forth every year the best Mulbroms. This is also called Lapis Litzi, and Lapis profius, which is divided into three kindes, that is Jalpin, Armeniacus, and Lapis phrygim, called also Belemintes; wherewithat the Chirurgians of Profile and Pomerania, cure green wounds, and the Physitians break the stone in the bladder. But the true Lyncurium which is extant at this day, and current among the Apothecaries, is as light as the Pumice. stone, and as big as filleth a mans fift, being of a blackish colour, or of a russet; the russet is more folid, fandy, and fat, and being bruifed or eaten, tafteth like earth: both kindes are covered with little white skins, and there is apparent in them, a spungy tenacious substance, and this I take to be the Million whereof Hermolans speaketh. And by the little stones and small skins, it may be conictured to be Corpus beterogenes, in terra coalescens: A Hetrogenean body encreasing in the earth. wherewithal it hath no affinity.

There was another stone of the urine of a Linx to be seen in Savoy, the substance whereof was clearly crystal, the form of it was triangular, the hardness so, as you might strike fire with it, and the colour partly white, and partly like Wine mingled with water; fo that I will conclude, that the urine of a Linx may engender a stone, though not in such manner as is beforesaid. For the Arabian Imath affirmeth, that within seven dayes after the rendring, it turneth into a stone; but it is not the Lincurium properly fo called, for that is the Amber or Gum before spoken of, although

catachrestically fo called.

And if it be true, that there be certain Mushroms neer the Red-sea, which by the heat of the Sun are hardned into stones, then also it may follow very naturally, that those stones may produce Mulhroms again, for both the diffolution and the conflictation of things are thought to be grounded upon the same principles. And thus much shall suffice for the urine of the Linx, and the stone

The skins of Linxes are most pretious, and used in the garments of the greatest estates, both Uses of their Lords, Kings and Emperors, as we have shewed before, and for that cause are sold very dear. The several parts, claws of this Beaft, especially of the right foot, which he useth in stead of a hand, are encluded in Eberus. filver, and fold for Nobles a piece, and for Amulets to be worn against the falling fickness. The love of these beasts to their young ones is very great, like as the Pardals, Lions, and Tygers. The King of Tartaria hath tame Linxes which he useth in hunting, in stead of Dogs. The antient Pagans King of Tarraria nath tame Linxes which he triumphed in his chariot of Vine branches, dedicated this Beaft to Bacobin, feigning that when he triumphed in his chariot of Vine branches, Linxes tamed. hewas drawn by Tygers, and Linxes. And therefore Virgil faith;

Quid Lynces Bacchi varia.

And Ovid :

Dicta racemifero Lyncas dedit India Baccho.

All the nails of a Linx being burned with the skin, beaten into powder, and given in drink, will Themedicines very much cohibite and restrain abominable Lechery in men : it will also restrain the lust in women of the Linx. beingsprinkled upon them: and also very effectually and speedily take away either itch or scurf in man or womans body. The urine of this Beaft is accounted very medicinable for those which are troubled with the Strangury, and running of the reins.

The same is also very good and wholesome for the curing of any pain or grief in the winde-pipe Pliny. or throat; Bonarus Baro doth a affirm that the nails of Linxes which are in their Countrey, are had in great estimation and price amongst their Peers and Noble men: for there is a very certain opinion amongst them, that those nails being put upon the yard of either Horse or Beast whose urine is kept back or restrained, will in very short space cause them to void it without any grief at all. Hereporteth also that their nails do there wax white, and that they include them all in filver, and do commend them for an excellent remedy against the Cramp, if they be worn (peradventure because they are bending and crooked) by which perswasion there are some superstitious men which hang certain roots which are crooked and knotty about them against the Cramp. There are some which do ascertain that these nails are good and ready helps for the soreness of the Uvula which is in the Horses mouthes: and for that cause there are many Horsemen which carry them continually about them.

The Linx or Wolf, which is begotten of a Wolf and a Hinde, the Musk-cat, the Weafill and all Arnoldus. fuch other like Beafts, do more hurt men by their biting teeth-wounds then by poison. There was terrain Hunter, as Gollinus reporteth, which told him that the flesh of a Linx being sod in some hot pottage or broath, and afterwards eaten, would be a very good and wholesome medianess. cine for the expelling of the Ague, or Quartan Fever; and that the bones of the same Beast being burnt and pounded into powder, would be a very excellent remedy for the curing of wounds which are old and fiale, and full of putrifaction, as also the Fishulaes which grow in the thighes or hips

ÖE

Mushroms

The several names.

THis beaft is called in the Hebrew, Oach, or as some say Ziim ; amongst the drablans, Eafloz, or rather Kacheobeon, or Kachineon; in Latine, Martes; the Germans, Marder, or Marter, like the Englift , the Italians, Marta, Martore, or Martorelle; the French, Mardre, or Foyne; the Spaniards, Marta; the Illyrians and Polonians, Runa; and some latter Latines use the words Marta, Martarus, Marturus, and Marturellus, and the reason, or etymology of this Latine word is taken from Martia, which fignifieth Martial, because this beaft in warlike and hostile manner, destroyeth her adverfaries, and liveth upon the prey of Hens, Birds, and Mice. The Germans divide these into two kindes, which they call by the names of Tachmarder, Huffmarder, Steinmarder, Buechmarder, Feldmarder, Wildmarder, Thanmarder, Fiechmarder, that is to fay, the Fir-martin, the Rock-martin, the Tame-martin, the Beech-martin, the Fieldmartin, the Wilde-martin, and the Wallmartin. For they live either in houses, wals, and Temples, or else in rocks, fields, and woods: And yet is not their distinction taken only from the places of their aboad, but also from the goodness of their

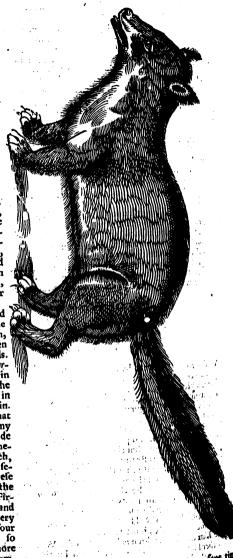

Places of their

Martins.

And therefore the French call the word Martin by the name of Foines : And the skins of the Fir-martin, or House-martin, are far more beautiful to look upon, then those that live wilde in the trees or Woods. Agricola calleth the Wood-martin Baummarder, because it liveth for the most part in trees, and faith that it never forfaketh the Woods, or very feldom, and therefore in that thing differeth from the Fir-martin. But herein he seemeth to be deceived, that he ascribeth to the Beech-martin, a loamy or red throat, and also a continual abode among the Woods. For they come fometimes to houses, and to Rocks; for which, as we have said already, it is called a Housemarder, and Rock-marder. And all these multitude of names, do but express the two kindes afore-named, whereof the Fir-Martin is most excellent; for Princes and ther skins, and great Nobles are clothed therewith, every skin being worth a French crown, or four shillings at the least. And they are so much the better, when there are more

how to chule

For their ordinary colour is a deep brown yellow, and there that are clean white, are four tops worse then the former; and therefore are not sold for above three or four groats a piece, borfoever the saying of Martial, Venator capta Marte superbus ades. Here cometh the proud funter has
hath killed a Martin, may very well be expliced. hath killed a Martin, may very well be applyed unto them which take any of their bests, for they cannot chuse but be required. they cannot chuse but be very joyful, which get a good sum of money for a little labour, is the prince behave for a Martins skin. By inspection of the Foins, that is, the Martins of the beech is that the free men called a Beech Form where a constant is the Martins of the beech is that the French men called a Becch, Fau, from whence cometh the word Foines, you may fee, that ber skins are more dusky, having a sail both characteristic between the word foines, you may fee, that ber skins are more dusky, having a sail both characteristic between the word foines. skins are more dusky, having a tail both greater and blacker then the Martins of the Firs. As therefore you must understand, that they of the Firs are by way of excellency called Marios

and the other of the woods called Foines. There is no great difference betwixt their bieness: and if by their skins at any time there feem any inequality, in breadth, or length, it must be attributed to their age and difference of years, and nor to any proportion in nature or diffinction of kinde. And as we have faid that the Fir-Martins are absolutely the best, yet that is not to be understood generally. For the Martins of Polonia are so brown, that they are altois not to be indictional general markets and are accounted no better then the common Beech-Martins. Wherefore the bright-brown afperfed with white hairs is ever, accounted more pretious without all exception, and by that colour upon the back of the skin, the skinner judgeth of the worth, and not by the vellowness of the throat.

Of the Martin.

yellowness of the throat.

Of these Beech-Martins there are great plenty in the Alper effectively on the South-side, Regions breed which look towards Italy, but very sew of the Well-martins. But on those farts of the Alper ing Martins, which look towards Germany and the North phare are aboundance of Fir Martins with yellow throats, for you must remember that the Welley Martin hath a white throat hid the Fir-Martin a vellow throat.

There are also of both kinds in Helynia and the molt extellent are in the vales towards Eraf Siella, the Alpes. In France there are no Martins of the wall, but the Beech Martins live in hollow becches. There are also woods of the Beafts in Bruffia, which the people there call Gannt.
Lanzenucca a wood of Scandenavia fourfcore miles long, is full of Martins. Also Muscovy. and Lituania have store of these Beasts, and Sabels. But they of Lituania, are the whitest in Olaus Mag.

The people of Sarmatia in Europe, wear garments of these in Sables; and the inhabitants of To Bobemus. Senhia, Hungaria, neer Tanan, do pay yearly unto the Emperor of Ruffia, once called the Duke of Muscovia, a certain number of Babels and Martins skins. There are also store of Martins neer.
Bragansa, and generally in all parts of Europe except in England.

They are in quantity about the bigness of a Cat, having longer bodies, but shorter legs, Their quantity with heads and tails like a Fox, their skins ordinarily brown, white on the throat, and more ty and feveral vellow on the back.

Their teeth are exceeding white, and unequal, one longer then another, being above measure tharp, and the canine teeth both above and beneath hang out very long. Amongst which on the neather chap, frand fix small cutting teeth in a right line over against one another; which I think happeneth not in any other Beat of the world. The grinding teeth are like a faw, being mangular in fashion, eight above and eight beneath. Whereof the furthermost upon the upper most fide of the mouth, ate more deep and inward in the palat, then all the residue a the whole number is thirty two. The long hairs upon their upward lip doe bend clean backs wide and alam nings and

Notwithstanding that there be two kindes of this Beast, as already we have faid, yet dotthe Their copuls-Wood-Martins; or Beech-Martins, greatly defire copulation with the other wherefore Albert tion. twaith, Missensir interse bed genera, or Martin phagis fore sequent with the Pir Martin algument debilering, a sequent with the Pir Martin and desireth her copulation as the nobles kind, that he may thereby dignific his own liffue. It should feen that they breed in March, and make their nelts like the draies of Bquirrels, and bring forth many at a time; For it was conftantly affirmed by a Countrey-man of Germany, than he found a neft of thefe Martine builded like a Squirrels, having foultyoung ones mit, in the begin-Same, the most find the first the derived the legal Miles and Molesare Thing to gain of gaing the gain of gain of the same and the first same of the s

and Martins.

The feveral names.

Do utterly diffent from all them that hold opinion that the Mole or Want is of the kind of Mite, for that all of them in general, both one and other, have two long crooked foreteeth which is not in Moles, and therefore wanting those as the instance of four-footed Beasts. But concerning the for granted that it pertaineth not to that rank or other of four-footed Beasts. But concerning the Hebrew name thereof, there is much variance, and little certainty amongst writers. Some of them calling it Tinschemet, which word is found Deut. 14. which is also translated by the Chaldeet, Bose or Bavela, a Swan, and the Sepluagints and Jerom, Ibis, and Rabbi Solomon in another place of the fame Chapter translateth it a Bat, which the French call Chaulve-fouris. But in that place of Levit. 11. where the Stellig, the Lizard, and Tinfebemet, are reckoned unclean Beafts; Rabbi Selemen interprete it Talpon, the Mole. The Septungints, Spalen; the Colder, Afchutes the Arabian, Lambanas, the Perfian, Angurbah-dedath, There is a fentence, Ifa. 2000 Hebrew and, Lachopon peret viladiobint which by Munfter ils thus translated. In the projects bono curses & angeness death in fifun tobe. run d'vespertillonum. In that day fedli a man east away his goods of Gover and gold on the boles of Molet and Bats. By S. Feram it is translated thus, Projectet hame labla, ufque uprati aget tales & unfittiliones. Aman fhall cast away his Idols to worship Moles and Bats. Some again make but one word of Lastepopperor, and translate it a Bealt digging ditches; and the Septregime Idola or aboutations, and think that they were so called, because their queward forms representate forme reptile creature, and Symmethus, unprofitable things but Aquila, Quaga, digging Beafts and therefore at this day all the learned take Penal for Moles, to called by reason of their digging. Avicen calleth it Pelagon, a blinde Moule. In Greek it is called famenines Spalmibut more often Afpalan : yet Albertus, callethit by a ftrange Grecian name Coliticand Redy, which he took from Avicen. The Itelians retain the Latin word Tulpa; the Spaniards, Topo; by which word the Italians at this day call a Moule. The Franch call it Tables when Germany Midwift and in the Italians at this day call a Moule. The Franch call it Tables when Germany Midwift and in Saxon, Molwarffe, from whence is derived the English Mole, and Molewarp. The Midwinson, Saxon, Molwarffe, from whence is derived the English Mole, and Molewarp. The Hellands, and the Schermann Schermouse, and the Molecular Call Schermson of digging The Hellands, and the Flemmings call it: Mol. and Modernifes in marcacion of the German word : the Illyriant Brown house nerally the name is taken from digging and turning up the carth with her note taken from to the faying of Wight 15 (and od) and good and good described of the Mine sent as De la com l'is che a would et abroad i e che a digita

India called alfo in Gunk, Indurer, and Siphnau, of Siphnauht catthe bessule in the order earth, and turneth ioupward to make it, hollowfor passage. The like hanghe say of his order names, Iklieches, and Orthogenticor je Bur this hall hilled forthis names and his to mine of season

In Brotis about the Champaigns called Orebinserius agest there erather greated fore of Mois in the world; for by digging they undermine all the fields, and yet in labelia canther Com trey of Baoila, there are none at all, and if they be brought thither from any other these will reveal distance the Ballian Co. will never dig but die. Rodolphus, Oppianus, and Albertus affirm, that they are created of the felves of wet earth and rain water, for when the net the month to plustifies the Mole beginnethe

They are all for the most part of a black duskie colour, with rough, short and smooth fost bairs wooll, and those hairs which were whitest when they are yong, are most glistering and perfect blut when they are old : and Gefner affirmethichat he saw in the end of Ottober, a Mole taken which me were white mixed with a little mixed with a litt very white, mixed with a little red, and the red was most of all upon her belly, betwixt her foreign Of the Mole.

and the neck, and that it could not be a young one, because it was two palms in length betwirt his

These Beafts are all blinde and want eyes, and therefore came the proverb Talpa cecior. Tu blote- Blindnest of res a spalaces, blinder then a Mole; to signifie a man without all judgement, wit or foresight; for Moles: ir is most elegantly applyed to the minde. Yet if any man look earnestly upon the places where they should grow, he shall perceive a little passage, by drawing up the membrane or little skin which is black, and therefore Arifotle faith of them in this manner probably;

All kindes of Moles want their fight, because they have not their eyes open and naked as other Beasts, but if a man pull up the skin of their browes about the place of their eyes, which is thick and hadoweth their fight, he shall perceive in them inward covered eyes, for they have the black circle, and the apple which is contained therein, and another part of the white circle or skin. but not apparently eminent; neither indeed can they, because nature at the time of generation is hinnot apparently of the brains there belong to the eyes two strong nervie passages, which are ended at the upper teeth, and therefore their nature being hindered, it seaveth an imperfect work of sight

Yet there is in this Beast a plain and bald place of the skin where the eyes should stand, having outwardly a little black fpot like a Millet or Poppey-feed, fastened to a nerve inwardly, by pressing it, there followeth a black humor or moistness, and by diffection of a Mole great with young, it is Albertas. apparent (as hath been proved) that the young ones before birth have eyes, but after birth, living continually in the dark earth without light, they cease to grow to any perfection; for indeed they need them not, because being out of the earth they cannot live above an hour or two.

End hath a pretty fable of the Asse, Ape, and Mole, each once complaining of others natural wants; the Affe, that he had no horns, and was therefore unarmed; the Ape, that he had no tail like other Beafts of his flature and quantity, and therefore was unhandsome; to both which the Mole maketh answer that they may well be filent, for that the wanteth eyes, and so infinuateth, that they which complain shall finde by consideration and comparison of their own wants to others, that they are happy and want nothing that were profitable for them.

Oppianus faith, that there was one Phineus which was first deprived of his eye-fight, and afterward turned into a Mole : It should seem he was condemned first to loose his eyes, and afterward his life.

These Moles have no ears, and yet they hear in the earth more nimbly and perfectly then Their several mencanabove the same, for arevery step or small noise and almost breathing, they are terrified parts and andrun away, and therfore (Plin) faith) that they understand all speeches spoken of themselves, members, andthey hear much better under the earth then being above and out of the earth. And for this cause they dig about their lodging long paffages, which bringeth noises and voices to them, being spoken never to low and foftly, like as the voice of a man carryed in a trunk reed or hollow thing.

Their fnour is not like a Weafils, as Suider faith, but rather like a Shrew-moufes, or (if it be lawfiltocompare small with great) like to a Hogs. Their reeth are like a Shrews and a Dogs; like a Shrews in the neather teeth and furthermost inner teeth, which are sharp pointed and low inwardly, and like a Dogs, because they are longer at the sides, although only upon the upper jaw, and therefore they are worthily ealled by the Grecius, Marostatom; that is dangerous biting teeth, for as in Swine the under teeth stand out above the upper, and in Elephants and Moles, the upper hang over the neather, for which cause they are called Hyperphereis.

The tongue is no greater then the space of hollow in the neather chap, and they have in a manner 25 little voice as fight, and yet I marvel how the proverb came of Loquax Talpa, a pratting Mole, in a popular reproach against wordy and talkative persons, which Ammianus saith, was first of all applyed work Julianus Capella, after he had so behaved himself, that he had lost the good opini-

The neck feemeth to be nothing, it is so short, standing equal with the forelegs. The lights are nothing else but distinguished and separated Fibres, and hang not together upon any common root or beginning, and they are placed or feated with the heart, which they enclose, much lower toward the belly then in any other Beaft. Their galf is yellowifh, their feet like a Bears, and fhort legs, wherefore they move and run but flowly; their fingers or toes wherewithal they dig the earth, are amed with there nails, and when the feeleth any harm upon her back, prefently the turneth upward and defendeth her followith her snow; and feet . with her feet she diggeth, and with her nose Cardania. collect away the earth, and therefore facts earth is called in Christing, Mattherff; and in England, Million; and the loveth the fields, especially meddowes and Gardens, where the ground is soft; for it is admirable with what relevity the casteth up the earth. He (40)

They have five toes with claws upon each forefoot, and four upon each foot behind, according to Allering but by diligentin pedion you hall finde five behind also, for there is one very little and recurred backward, which a man flightly and negligently looking upon, would take to be nothing. The palm of the foreifeet is broad fike a mans hand; and hath a hollow in it if the part of the foreifeet is broad fike a mans hand; and hath a hollow in it if the part of the foreifeet is broad fike a mans hand; and hath a hollow in it if the part of the foreifeet is broad fike a mans hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hath a hollow in it if the part of the foreifeet is broad fixed a man hand; and hand hath a hollow in the foreifeet is broad fixed a man hand hand had been a man hand had been hand had been had gether likes fifth and the toes or fingers with the nails are greater then any other beafts of the quality ity. And to the end that he might be well armed to dig, the fore part of her fore legs confift of two folid and found bones which are fastened to her floulders, and her claws spread abroad, not benefitly to her floulders. downward and this is peculiar to this Beaft not competible to any other, but in her hinder lend that her but h both before and behind they are like a Moules; except in the part beneath the knee, which confifted

but of one bone which is also forked and twifted. The tail is thorr and bairy. And thus much for the Anatomy and several parts.

natomy and leveral parts.

They live as we have faid in the earth, and therefore Cardan faith, that there is no creature which hath blood and breath that liveth fo long together under the earth, and that the earth doth not hath blood and preach that he tree in 1918 to which cause they keap it hollow above them, that at hinder their expiration and inspiration; for which cause they keap it hollow above them, that at ninger their expiration and impressing, they do not heave in two or three dayes; but I rather be. no time they may want breath, although they have then for breath, for by digging and removing the lieve when they heave, they do it more for mear then for breath, for by digging and removing the earth they take Wormes, and hunt after victuals.

When the Wormes are followed by Moles, (for by digging and heaving, they foreknow their own perdiction) they flie to the superficies and very top of the earth, the filly heaft know. their own peraition, they me to the appearance and year how into the light, fo that their wit in flying ing that the Mole their adverfary, dark not follow them into the light, fo that their wit in flying their enemy is greater, then in turning again when they are troad upon. They love allo to eat their enemy is greater, their in turining again whose leg a Mole held fast in the earth, Toads and Frogs, for Albertus faith, he saw a great Toad whose leg a Mole held fast in the earth, 10aqsana rrogs, for made an exceeding great noise, crying out for her life, during the time and that the Mole did bite her. And therefore Toads and Frogs do eat dead Moles. They eat also the root of Herbs and Plants, for which cause they are called by Oppianus, Poiophagi Heshima,

Enemics to Males.

In the month of July they come abroad out of the earth, I think to feek meat at that time when herb-eaters. wormes be feanty. They are hunted by Weafils, and wilde Cats, for they will follow them into their holes and take them, but the Cats do not eat them: whereas we have faid already, that they have an understanding of mens speech when they hear them talk of them;

Under ftanding of Moles.

Taking of

I may add thereunto a story of their understanding, thus related by Gillius in his own experience and knowledge. When I had (faith he) put down into the earth an earthen pot made of purpose with a narrow mouth to take Moles, it fortuned that within short space as a blind Mole came along the fell into it and could not get forth again, but lay therein whining; one of her fellows which followed her feeing his mate taken, heaved up the earth above the por, and with her note can in fo much, till the had raifed up her companion to the brim and was ready to come forth; by which in that blind creature confined to darkneis, doth not only appear a wonderful work of Almighty God, that endoweth them with skill to defend, and wifely to provide for their own fafety, but also planted in them such a natural and mutual love one to another, which is so much the more admirable, confidering their beginning or creation as we have thewed already. Because by their continual hearing and laboring for meat, they do much harm to Gardens and other places of their aboad, and therefore in the husband-mans and house-wises common-wealth, is is an acceptable labor to take and defitoy them. For which caufe it is good to observe their passages, and mark the times of their coming to labor, which being perceived, they are sailly turned out of the earth with a laste, and this was the first and most common way.

Some have placed a board full of pikes which they fasten upon a small stick in the mole bil or

passage, and when the mole cometh to heave up the earth, by touching the stick the bringen down the pikes and tharp nailed boards upon her own body and back. Other takes Wyar of hop, and make it to have a very tharp point, which being fathened to a flaffe and put into the cartawhere the Moles passage is, they bend and for fet up, that when the Mole cometh slong, the pike suppost isto

her and killeth her.

The Grecians (faith Palladius) did destroy and drive away their Moles by this investion they took a great Nut, or any other kind of fruit of that quantity, receipt and folidity, wherein they included Chaffe, Brimstone and Wax; then did they hop, all the breathing places of the Moles ex cept one at the mouth, wherein they fet this devide on fire, so as the smooth was driven inwid, wherewithal they filled the hole and the place of their walks, and to topping it the moles were

Alto Paramy the weth another means to drive away and take Moles . If you take white Hellebor, and the rindes of wilde Mercury is freed of Hemlock, and drythem and beat them to powder, after ward life them and mix them with maal and with milk-beaten, with she white of an Eggs, and to make it into little morfels or bals, and lay them in the Mole-hole and passages, it will she with the matter of as they will appear to the morfels of th

eat thereof, as they will certainly do

Many ula to kill both Moles and Emmete with the froath of new Qut And co conclude, by ferting an earthen, pot in the earth and Brimstone burning therein, it will certainly write them for ever from that place. Unto, which I may add a hyperflitious conceit of an objecte Anthony who writesh, that if you whet a mowing furhe in a field on maddow upon the feateday of theils Nativity (commonly called Christman day) vity (commonly called Christmas day) all the Moles that are within the bearing thereof will containly for ever for fake that field, meddow or Garden.

11 fe of their

With the skins of Moles are purses made, for the rough, and fost hair, and also black rule coloun is very delectable. Plny hath a strange laying, which is this a Empellibus rule and shahander dimus. Brasula. dirent firaquia; ades ne raligio quidem a potientis fummquet delicias; thet is; We have foun tighanges of Chambers made at mole skins, to that no confeience of religion cannos avera the management of delights from the affectation of men.

For all the ancient Wife men and Magicians did hold, that this beat was capeable of Ruigos Nullis aque credunt escie, nullum Religionia capacini judicant animal, utifriquis cor ajmi rams, habines descrite. deperarit, divinationis, & reram efficiendarum entitus promittat; they give netific mach caedit to to

intrails as to theirs; for they judge that no beaft is fo capable of Religion, because if a man est the heart of a Mole newly taken out of her belly and panting, he shall be able to divine and forestel infellible events. Another faith, Veteribus menumentis traditur. Gullinaceurum fibrus muxime dir gratte bi- Alex. 16 Al deti: sicul Talparum viscera Magi verissima dicunt, illisq; band secus quam solenni villima litari. Dec enim funt exta argutifima, in quibus divina mens ineffe creditur : that is, the fibres of Cocks were wont among ancient Monuments to be accounted most acceptable to the Gods, even as the bowels of Moles (as the wife men fay) and to offer thefe as a most folemn facrifice grateful to the Gods, and that in those intrails it was believed that the minde and pleasure of God was feated and engraven : and a little after he faith, that the bowels of Moles and frogs do foretel many great and fortu-

But I will leave this paganism, and let it never enter into the heart of a reasonable man, that fuch beafts can love Religion, or that God hath planted in their bowels and corrupt parts, fuch letrers of his wisdom and fore-knowledge, which he hath not granted to the immortal and incorruptible foul of man. Only this I finde by experience, that before any rain and change of weather, thefe filly beafts heave up the earth more abundantly then at other times; and that in Theffaly (as Varro faith) a whole Town was once undermined by Moles. They were wont to facrifice this beaft to Nepune. because of the affinity betwixt their names, for in Greek Asphaloss, fignifieth Neptune, and Asphalax, a Mole. Alunnus also writeth, that they were facred and dedicated to Hell, because they kept continually within the bosom and bowels of the earth; and to conclude, because that Moles would not live in Coronea a part of Baotia, before spoken of, and thereof came the common proverb. Alphalaca eta Coronean, a Mole is brought to Coronea, to fignifie the hatred of a gift or gheft to him that is forced to receive him. Thus much for his natural and moral flory : now followeth his medicinal.

The Medicines of the Male.

There is nothing which is more profitable or medicinable for the curing of the bites of a Shrew, then a Mole being flead and clapped thereunto. The fame doth also very effectually cure and heal the blows or bitings of a Scorpion. Pills being made with that which proceedeth from Moles with Pling. Hony, eaten nine days together, doth preserve the body of any one from swellings or bunches in the fieth, who shall so eat them. For the attoiding or driving away the hairs which grow in any part of mans body, that they may never return or be renewed again . Take a Mole and lay her in water Arnoldur. to be freeped or loaked, for long as the fhall not have any hairs left upon ther, with this water anothe the place which is full of hairs, and afterwards wash is with lie made of affres; and then rub it with a limen cloth; then if you half fee the house o return again, wash it twice or thrice in the aforehid manner, and they will be quite expelled away, and by no means can be made either to renew or come again. For the ranewing, and bringing again of those hairs which are fallen or decayed, Furnerius. takes Mole, and burn her whole in the sking and mingle the duffeor powder which cometh from the same with Mony unto the thickness or fashion of an Olnerhend, and this being rubbed or attointed wonthe bare on bald place will without doubt in fome fliore time or force procure the hair try grow thick. For the renewing of hairs which fall from Hories : Takea Mole and boil her in Ovil, illicitall Ruffine the field be confumed and quite diffolved into a liquid juyce, with this Oyl amoint the place which is pare or defigure of pairs ewice every day for fome fiore thate, and it will make the hairs to grow in

For the changing of the hairs of Horses from black to white, rake a Mole and boil her in Sale water, or lye made of ather three days together, and which the water or lie first be quite confluend. purnew water or lie chereanto a this being done wath or bathe the place with the water of lie former what hoe; prefencly the black boirs will full and filde away; and in fonce fliore time there will come white. Whosoever shall take a Mole and hold her in his right hand until the die, fifall have fich an excellent vertue shorein, that the shall ente the path of a woman breath only by rouch-

The same effect hath the right foot of a Mole for the affiwaging of

bunches and swellings arising in the flesh.

of the vulgar little MOUSE.

Moule.

The feveral

S we have handled the natures, and delivered the figures of the great beafts, fo also must we A not difdain in a perfect Hiftory to touch the smallest & For Almighty God which hath mide them all, hath diffeminated in every kinde both of great and small beasts, seeds of his Widom, Definition of a Majesty, and glory. The little Mouse therefore is justly tearmed, Incola domus nofira, an inhabitant in our own houses, Et rofer omnium rerum, and a gnawer of all things. And therefore from the found of her teeth which she maketh in gnawing, the is called Soies. Although we shall shew you afterwards, that Sorex is a special kinde, and not the name of the general. Wherefore seeing there be many kindes of Mife, and every one of them defireth a particular tractate, I thought good to begin with the Vulgar little Moule, and so to descend to the several species and kindes of all, according to the method of the Philosopher, A notivibus ad minus thate, from things that are most known to them that are less known. In Hebrey it is called Acher, Levit. 11. where the Sequegine translate it Muys, the Chaldee, Achera; the Arabians, fer, or Phar; from whence cometh the Seracen word re-ra. The Persians, An Mus; the Latines, Mus; the Scalines, Topo, or Sorice, Alforgio, O Rato, Di cefe, although Rato fignifieth a Rat, both among the Germans, French, and English. The Spaniards catthe little Moule, Ratt; and the great Rat, Ruez isthe French the little Moule, Souris; which word feems to be derived from the Latine, Sorex, and the great Mouse they call Rait. The Germans the great ones Raiz, and the little one Muss; the Illyrians and Poloniaus, Mys, which is the Greek word; and the great one they call Sozurez; the Venetians call the Rat Paniegana, of Pontid the yulgar Greek hame, and the Romans, Sourco.

Paufanias.

B. Buch

Now the dignity of this little beaft, may appear by the name, which hath spread it self both to of fundry crea- beafts, fishes, men, herbs, and Cities. To beafts as we have shewed before in the Ichneumon, which tures from the is yulgarly called the Indian Moule, or Pharaobs Moule And to fishes, for there is a little fifth called Musculus, and in Greek, Mystocetos, the Whale-mouse, because it leadeth the way, and sheweth the Whale whither foever the swimmeth, for the avoiding of Rocks, (according to Plin) although Rondoleties affirmeth otherwise, namely that that guide of the Whale is called Egemon, and Egint, and Myliceties (he saith) is a shell-fish. Generally most kinde of Oysters are also called Mylicetes the control of the saith of the called Mylicetes are also called Mylicetes. fometimes they gape and make a noise like a Mouse, and close their shells again. The purple since be alfo called Myli; there is likewife a kinde of pretious from called Mya, about Bofphorus Toucius, and

many other such dignities, hath the the name of this beaft attained.

There was one Myr, the fervant of that famous Philosopher Epicarus; likewife the name of a Champion or Challenger, in Suides and Varintis, and therewas another called Min, of executive skill for ingraving in Silver, and therefore did draw upon the thield of Mineroa, the fight betwixt the Lapithe, and the Gentaurs, and many other thinges, Whereupon Marial made Things on they deline . this verse; Quis labor in Thiala? delli Myse? anne Mysonis?

There was a Conful of Kome, whose name was Mus, and therefore Camerarius made this Riddle of the Moule; Parva mibi domus eft, fed janua Jemper operta Acciduo Sumpru, furtiva vivo (egina, Quod mibi nomin melt , Roma quoq; Confai babebat. The Thraciant call'd Argilias a Moule, and the City which he builded Argelus. Myer was a City of Ionia, and a Citizen of that City was called Myenus. Myen a City of Lori in Epirus, and the people thereof are called Myones. Myone his a little Region Betwire Treat and Lebedon, and according to Stephanus, an Island near Epbelus; the first Port or Haven of Level, opening to the Red Sea, is called Muss simer, the Moules haven, and Mylin also feemeth to be derived from their ftem. There is an Island under the Equinoctial line; called Injula Murium, the Moule Island, because of the abundance of Mice therein : and to conclude, event he herbs and plants of the earth. have received names from this little beaft, as florideum, Murinam Myanamba, Sperage, Myopte- Theuthit. un, Myuco, Myortocon, Moule-bar, Moule-fubriand fuch like. There have been also Comedies made of Mili, as that of Carfinus, called Myes, wherein the Weali I firengleth the night wandering Mys. And another Greek, called Galeomyemathia, that is a fight betwitt Cats and Mice; wherein the Poet doth another Green, cancer Gateomyemators, that is a figure between the Note and Mice, as their King he calleth Greillur, that is, a flesh-eater, and his eldest fon Psicarpas, a corn-eater; and his second son Psicolarpes, bread-eater, and his eldest daughter, Lyenoglupho, candle-eater; and all his Ancestors Carpodopial, that is, fruit-eaters. And then he ed and why of bringeth other Mice in, as Turolico, Psicolares; Cobleccelephot Homer in his Battachomyomachia, that is, a the proper names of Mice. bringeth other vince in, as auronion, synoners, conecceptor exomer in his variaccomponacoia, that is, a fight betwire Frogs and Mice, doth very elegantly describe divers proper names of Mice. As fisher, par, whose father was Tibuantes, and his mother Lyobbille, daughter of Piethorrolla the King, and then other Mice, as Lychopinates, Terogliphus, Embaschitrus, Lyobehor, Troglithes, Airophagus, Piermobilishus, Piermobagus, Chisobagus, Sisobagus, Mriophilus, Meridurpha, and Thulacotrox, all which are not only out of the abundance of the Authors wit, but invented for the expressing of the Moules

The Epithets of Mice are thefe; thort, fmail, fearful; peaceable, ridiculous, ruffick, or Country The colour of Moule, urbane, or City Moule, greedy, wary, unhappy, harmful, black, obseene, little, whither, biter, Mice. and earthly. And the Greek ones are expressed before in the proper names, and thus much may fuffice for the names of Mice. Now to come to their feveral nature and fignifications. First of all Scaliger. concerning their colour. Isis divers, for although evier murinit be a common tearm for a Mouse Albertm. colour of Affes, yet notwichftanding Wice are fometimes blackiff, fometittes white, fometimes vellow, fometimes brown, and fometime afh colour. There are white Mice among the people of Sa- The quantity wy, and Dauphin in France called Allobroges, which the Inhabitants of the Countrey do believe that and several they feed upon fnow. But the white Mouse is above all other most lascivious and leacherous, and parts of Mice, therefore it came into a proverb, Mys Land, My Gacor, the white Modle is an ill Moule, of whole Matheolm, luft Alciatus made this Emblem : is mostlich ที่เกรา , เดิมพากรับ

Gold-smiths did cut them in pieces among their metals. Plutarch, in the life of Marcillus saith, that there were many prodigies and fearful fignes that did precede the war of Marin, amongst other, he faith that Mice did eat the Gold hanging in the Temple, and that one of the Temple-keepers in taith that rance and cat the Sold hanging in littered five little Mice in that place, and devoured three certain trap took a female Mouse alive, who littered five little Mice in that place, and devoured three of them. Anthologius rehearfeth a witty Hexastichon of Antiphilus, upon a Mouse which was slit of them. Antimorphis telled duft, which she had devoured, whereby was fignified how men afunderalive, for certain Gold-duft, which she had devoured, whereby was fignified how men annuer anve, for certain someone, and unavoidable moreal harms by stealing, and inprocure une themselves fignified by Gold. Vulgar Mice do rummate or chew the cud as well as the creating of riches fignified by Gold. Pontick, and they drink by licking or lapping, although their ceeth be not fawed. It is reported that che Mice of Africk, and especially of Lybia, die assoon as they drink. And the reason thereof we the rate of allow, and in the taking of Mice, when we come to discourse of their poysons. And for will shew afterwards in the taking of Mice, when we come to discourse of their poysons. And for why me and the present it should seem their temperament, or constitution is so moist, that nature can endure no drink without addition. Yet in the plains of Accadia, there are Mice which drink; of a certain Fountain without

The generation and procreation of Mice, is not only by copulation, but also nature worketh Theoporalius.

Generation of wonderfully in ingendering them by earth and small showers; as we will shew in the discourse of

Mice, and their wilde Mice. carnal copula.

But the house Mouse whereof we now intreat, is engandered by copulation betwixt male and semale, and they are in general most libidinous, as may appear by that laying of Craimal against Xe. nophon, Phere nun en althrias Katapupolunen muor aftrapfo Kenophontes, go to now, for from the skies I will firike by lightning the Murin wantonness of Xenophon; and the female is much more venerous then the male, as appeareth by that fable of Ipicrates describing the rage of a luftful woman. Pofiremo subjit me detostabilis lena, dejerans per Dionam, per puellam, per Persephattam, fe effe vitulam, effevirginem, effe pullam indomitam, at illa myonia etat. Then followed me that deteffable band, iwearing by Diana, and Perfephatta, that the was a Heifer never touched, a Virgin never stained, and a Cole never covered, but the truth is, the was as good a Maid as a Moufe. Politianus in ftend of at illa meniaerat, hath at illa cavut erat Murinut, that the was a Moufes hole , fignifying that her virginity was lost, and that the fuffered any lovers, as a Mouis hole doth any Mice. And from hence came that verse of Martial, describing the speech of a lover to his love, ealling him her Mouse and Date of the second of the seco aupon a see Bur che white Monte is above of the many her Joy;

Nam cum me Murem tu, cum mea lumina, dicis Arevora a ofui otaro non Bonnad : as Emblem

Albertus. Copulation of

So that in general all Mice, and not only the white Moufe, are most desirous of copulation. And when they are in copulation, they embrace with their tails, filling one another without all delay. By tailing of Salt, they are made very fruitful, and therefore Ariffelle, and the Souldiers of Alexander the Great do report, that Mice by licking one another and by the licking of Sett, do ingender & conceive with young without any other copulation. But what reasons they have to lead them to that opinion, I know not; beside that wonder reported by Pliny and Ariffelle, that in a sertain part of Palia, a female Moule being flit, afunder alive, alighe young famales within hen belly are alfo found pregnant conceived with young.

The is very certain, that for the timethey go, with woung, and too the number they bring

Two miracles in their procreation and multiplication.

forth, they exceed all other bealts, conceiving syry, fourteen saddixteen; days, so that inhath been found by good experience, that she made house having free liberty to litter in a welfel of millet-feed, within lets compain then, half a year the hath brought forth, one hundred and twenty

They live very long, if they be not prevented of their natural course, and dying naturally, they

Volaterranus

They live very long, if they be not prevented of their natural courtes, and dying naturally, they perform the live very long, if they be not prevented of their natural courtes, and dying naturally, they perform the live very long, if they be not prevented of their natural courtes, and kiten another of the said said in the performance of the natural courtes and then another of their said long the creatures of the satting a mounter, and then are in the line of the natural courtes and among the creatures of the satting a mounter of their said long the only caute hold a burning franche in the feature that he had the natural can h

to take vengeance on them for their wickedness, did not give them to much knowledge, nor make them fo wile as the beafts to avoid his judgement, and their own destruction; and therefore mark what followed. For these beasts were no sooner out of the City, but suddenly in the night time. came fuch a lamentable Earth-quake and strong tempest, that all the houses did not only fall down. and not one of them flood upright, to the flaughter of men, women, and children, contained in them; but lest any of them should escape the strokes of the timber and house tops, God sent also such a great floud of waters, by reason of the tempestuous winde which drove the waters out of the Sea upon the Town, that swept them all away, leaving no more behinde then naked and bare significations of former buildings. And not only the City and Citizens perished, but also there was Alianus. ten ships of the Lacedemonians in their port all drowned at that instant.

The wildom of the Mouse appeareth in the preparation of her house; for considering the hath Their natural many enemies, and therefore many means to be hunted from place to place, the committeeth not her wildom, felf to one lodging alone, but provideth many holes; fo that when the is hunted in one place the may more fafely repose her felt in another. Which thing Plantus expresseth in these words; Sed tamen cogitato, Mus pufillus, quam sapiens sit bestia, atatem qui uni cubile nunquam committit suam : cum unum obsiderur, aliunde perfugium querit : that is to fay, it is good to consider the little Mouse, how wife a bealt the is, for the will not commit her life to one lodging, but provideth many harbors, that being molested in one place the may have another refuge to flie unto.

And as their wisdom is admirable in this provision, so also is their love to be commended one to Their natural another, for falling into a veffel of water or other deep thing, out of which they cannot ascend again love to one of themselves, they help one another, by letting down their tails, and if their tails be too short, another, then they lengthen them by this means: they take one anothers tail in their mouth, and so hang two or three in length, until the Mouse which was fallen down take hold on the neathermost, which being performed, they all of them draw her out. Even so Wolves holding one another by their tails, do swim over great Rivers: and thus hath nature granted that to them which is denyed to many men, namely, to love, and to be wife together. But concerning their manners, they are Elianus. evil, apt to feal, infidious, and deceitful; and men also which are of the same disposition with these Their disposibeafts, fearing to do any thing publickly, and yet privately enterprise many deceits, are justly re- tion, and their proved inimitation of fuch beafts. For this cause was it forbidden in Gods Law unto the fews, not fich. only to eat, but to touch Mice, and the Propher Efai ch 66 faith; Comedentes carnem fuillam, & abomina - Proceptus. timem, aig; murem, simul consumentur, inquit Dominus, that is, they which eat Swines flesh , abominati- Arificas. on, and the Mouse, shall be destroyed together, faith the Lord : wherein the Prophet threatneth a cure unto the people, that broke the first Law of God in eating flesh forbidden ; and the Physicians allo say, that the eating of the flesh of Mice engendereth forgetfulness, abomination, and corruption in the stomach.

The eating of bread or other meat which is bitten by Mice, doth encrease in men and children a Hurt by Mice certain disease in their face, and in the flesh, at the roots of the nails of their fingers certain hard to the body of bunches, called by the Venetians, Spelli; and by the Germans, Leidspillen; and by the Latines, Dentes mankinde. Muis: yet it is affirmed, that the flesh of Mice is good for Hawks, to by given them every day, or Medicine of every each other day together with the skin; for it helpeth their intrails, purgeth fleam and cho- Hawks. ler; refraineth the fluxions of the belly; driveth out itones and gravel; flayeth the diffillation of Demetrius. the head to the eyes; and finally corroborates the fromach. Yet we have heard that in the Kingdom of Calcett, they do eat Mice and Fishes roasted in the Sun. And it is said by some Physitians and Magicians, that the flesh is good against melancholy, and the pain of the teeth; but the medicinal vertues we referve it to its proper place.

Play affirmeth a strange wonder, worthy to be remembred and recorded, that when Hamibal be- Esting of fieged Cafelinum, there was a man that fold a Mouse for two hundred pieces of coin, fo great was the Mice. extremity of famine, that the man which fold it, dyed for hunger, and as it should seem through the want of it, but he which bought it lived by eating thereof; the which thing argueth, that necessity, hunger, and famin, maketh men for the fafegard of life, to make more reckoning in extremity of the baleft creatures, then in prosperity they do of the best. For that person which gave so much money for a Mouse, at another time would have scorned to have given so much for four Oxen.

And on the other fide, the wretched love of gain, which caufeth a man to endanger his own life for love of filver. But I rather think that it was the hand of God himself taking vengeance of fuch a covetous disposition, which would not suffer him to live, that like Mids had gotten so

The enemies of Mice are many, not only men, which by fundry artificial devices kill them, be Enemies of cafe of harm, but also beafts and wilde fowl do eat their flesh, and live upon them. And first of all Mice. Cats and Weefile do principally hunt to catch Mice, and have been therefore by the late Writers called Murilegi, for their taking of Mice. And the nature of the Weefil is not only more inclined to Pliny. huntafter them, then the Cat, but is more terrible also unto them; for if the brains of a Weeli, the hair or renner be sprinkled upon Cheese, or any other meat whereto Mice resort, they not only forbear to eat thereof, but also to come in that place. They are also driven away by the sprinkling of theafnes of Weefils; and as all noises make them afraid, so none so much as the skreeching or crying of a Weefil, for at the hearing thereof they all fall aftoraffied. And befides, they have more opportunity to follow and take them then Cats, because their bodies are lesser, and their notes and snowts longer, and therefore they follow them many times into their holes, and very

Varrus.

nimbly pull them forth when they think they are most fecure. Foxes also kill Mice; and in Italy there is a black Snake called Carbonarie, from his colour, refembling coals, which I think to be the there is a Diack Snake caried a around to, from his hunting of Mice: This Snake dech also eat and defame that the Grecians call Myagros, from his hunting of Mice: your Mice. Hawks eat Mice, and all the night-birds, especially the night-crows and Owls. How vour Mice. Blanks eat Mice, and all the highest and property of the forty, how in the presence there hateful a Mouse is to the Elephant, we have shewed already in that story, how in the presence there of he will not touch his meat, nor eat any thing over which a Mouse doth run. Nor yet eat in the cratch or manger wherein a Mouse hath been. Porzellus affirmeth, that there is great love between Mice and Serpents, for fometimes they play together.

Mice and serpents, for sometimes they play a dice, as may appear by Anthologiu, Museus, and others. There is a hatred betwixt Bats, Frogs. and Mice, as may appear by Anthologius, Museus, and others. It is said also that they are hateful to Oysters, whereof I know no reason, except it be because they love their fish. And Alciaim hath a pretty embleme, which he entituleth Captium ob gulam, wherein he sheweth, that a Mouse watcheth an Oyster when he gapeth, and seeing it open, thrusts in his head ne ineweth, that a Moule watcheth an Oyster felt his teeth, presently he closeth his shell again, and so eat the fish; assoon as ever the Oyster felt his teeth, presently he closeth his shell again, and so crusheth the Moules head in pieces, whereby he deciphereth the condition of those men which deftroy themselves to serve their bellies. And thus much for the love and enmity betwirt Miceand

other Beafts.

Now concerning the actions of men, they hunt Mice to be rid from their annoyances, because they do not only destroy the things they eat, and live upon other mens cost; and therefore Parafites are compared unto unto them whom the Germans call Schmotorzer, and Tellerlecker, that is, smellfeasts, and lick-spickets, are compared to Mice, because they live at other mens tables. But allo Mice do defile and corrupt, and make unprofitable what soever they tafte; and therefore the Egyptian when they would describe corruption, do picture a Mouse.

For these causes have men invented many devices, snares, and gins, the general whereof iscalled by the Latines, Muscipula; and by the Gracians, Muspala, and Myagra, the divers and several forms whereof I will not disdain to set down. For the wise Reader must consider, that it is a necessary, or rather more necessary for most men to know how to take Mice, then how to take

Elephants.

And although every woman, and filly Rat-catcher can give instruction enough therein, yet their knowledge cannot excuse my negligence, if I should omit the inventions and devices of the Ancients, whereby they delivered themselves from the annoyances of these beasts. And therefore first of all to declare the manner of catching them in places where corn is kept : Let your Mousetrap be placed to catch Mice, right against the door, but let them have room to come in, and in short time it will so fear them, that they will trouble you no more. But if Mice breed in the ground under crevices, except you fill all the crevices with Mouse-traps, you will never catch them, which

the Inhabitants of the Island Pandataria are fain to do.

There are other kinde of Mouse-traps which do catch Mice alive: and othersome which do kill them, either being pressed down with the weight of it, or stiffed with water, or otherwise, as with a strong piece of Iron being small, and hung right against the button of the trap, on the which piece of Iron they hang meat, and so by that means the Mouse is catched by putting her head through the hole to fnatch at the meat; for fie by ftirring the Iron doth loofen the button, and foher head is thut fast in the hole. And there are other kinde of Mouse-traps which are covered all over, into the which the Moule may run; and if you have put any water therein they are presently sisted. Of all which kinde of traps shall be severally tracted : And first of all those which do catch Mice alive.

The common kinde of this Moule-trap is made of wood, long, and four-cornerwise, and is framed of four boards, but the hinder part is strengthened with strong wiers of Iron, that she may without danger look in to fee what she may get there; and that the smell of that which she findeth there, may allure her to come to it. And the sormer part hath a hole in the top, through which there is put a small piece of Iron; and also there is made a trap-door in form of a Percullis, to the which the Iton is very flightly hung, that when the Mouse cometh to catch at the meat, she is suddenly taken by falling of the same; but the meat which you fasten to the neather end of this Iron hook must be fat, or the crust of cheese or bread; which if it be a little toasted at the fire, it will not be amis, that the Moule may smell it far off. Some do make these kinde of traps double, with one door at one end, and another door at another end. These kinde of Mouse-traps Petrus Crescent. doth call traps

belonging to houses, which shall be spoken of hereaster.

The other kinde of Mouse-trap is made with Iron hooks hung in the round circle; in the midst of the which brim is put a great many of the same wiers, which being made sharp at everyend, are after the form of the top of a creft, or helmet, or as it is made in a bow-net to catch filnes; and upon the hook let there be hung meat, by which means the Mouse coming to the meat, flicketh herself upon the hooks. The manner of making leffer Mouse-traps is with Walnut-tree, and that the middle part of it be not covered, and that there be put to the mouth or brim thereof some kinds of mettle, fo that the open part may bend inward, and that the Mouse may not gnaw that which is within, except the creepeth under: which if the shall do, the shall presently be that in by fir-

3 HAlfo there is another kinde of Mouse-trap which is covered with the bark of a tree, which is of into equal pieces, and laid crofs one over another; but there is ried a Swines skin in the middle, and alfo an earthen pot covered with the same bark, being first sprinkled with corn, that the Mic may custom to come to it, and being dryed with lying, they break in pieces, but you must laythen together again, and fill your pot with water, by the which means affoon as ever they are upon the fame, they fall into the pit, and fo are stifled.

And also it is reported of those which have tryed the same, that if Mice sall into a vessel without water, and remain there a long time without meat, that then they devour one another, but if they remain there so long until one among them all be left alone, that is to say, the strongest of them all, and that he be suffered to go out, wheresoever he shall finde any Mice he will eat them up, and they shall have much ado to escape him, because he hath been so long accustomed unto them. I was told also of a certain friend of mine, that a man of Senenfis did set a purse in a hollow place, and made it to open and thut by some devise, so that at length he took a Mouse. which Moule he fed only with the flesh of Mice, and after he had fed it so a long time, he let it 10. who killed all the Mice he did meet, and was not fatisfied with them, but went into every hole that he could finde, and eat them up also. Also Mice are taken in vessels, from Grescentier whence they cannot escape, upon the which vessel let there be put a small staffe, which is so cut in the middle, that the may only hold her felf by the meat, and when you have fo done, put the kernel of a Nut upon the middle of the staffe; to the which the Mouse coming, doth fall into the veffel with the staffe, and they will be stifled if there be any water; but if there be none she will be

And again, he telleth of another manner of catching of Mice, which is as great as the first, and it is after this manner: Take two smooth boards about the length of thy arm, and in breadth half thy arm, but joyn it so together, that they may be distant from the lower part in length some four fingers or little less, with two small spindles or clefts, which must be at every end one, and saften Paper under them, and put a piece of paste therein, being cut overthwart in the middle, but you must not fasten it nigh the middle, and let it be so bound, that it may easily be lifted up betwist the spindles; that if by slipping it slould be altered, it might be brought again, to the same form. But the two spindles spoken of before, ought to be joyned together in the ends above, and beyond them another small spindle to be made, which may hold in the middle a crooked wedge or butten, upon the which may be hanged a piece of Hogs skin, so that one of them may easily be turned upfidedown with the skin, and put thereunto a little piece of earth or flick, that the Mice may easily come to it : So that how many Mice soever shall come thereto, and to the meat, shall be taken, always by rowling the Paper into his wonted place.

There's another manner alfo, which is to make a round piece of wood fastened on both sides with Needles, and made to that the hinder part of it weigh heavier then the former, and that it fund an inch higher then the other, and then when you have fo placed it, throw some corn thereon, that the Mice may be allured thereto, and tie also a piece of flesh upon the former end of it; and fo the Moule going into the middle, by the rowling off the same, slippeth into the kettle which fundeth under it, which must be half full of water, the circle presently being as it was before, that very often many Mice are eastered in one night by this work; all falling into the kettle. Also there Crescenten, are many kindes of Mice-traps, where Mice do perish by the weight thereof, and they are made of a small piece of wood made hollow, into the which shall fall down another small piece of wood; but ir must be made so, that it may fall weighty to press down the Mice going to the meat, and let the meat be tied to another little small piece of wood, which being touched, the heavy piece doth pre-

fently fall down, and fo by that means the Moufe is taken,

Our Country men do make a trap which is fomewhat like to this, let two pieces of boards be joyned together one foot broad, & two foot long, and afterwards let there be put in them a wooden pin, which you must fasten to the lower board; so that it may not touch the uppermost; and you mult fet it fo, that the former part may eafily move backward and forward; but moreover, the former board must be fastened to the hinder, like the fashion of a Gibbet or Gallows, with two pieces of wood flanding upright, one being put overthwart, or after the fashion of the Greek letter 11, and it mitt fland fome nine inches high, and as broad as the board will suffer you, and let the meat be hungin the middle of it, but that board which is uppermost, must touch both the ends of the other, and notched according to the breadth, the notch being made after the following discovery and not two parts; and another finall piece of wood must be put to that which is uppermost, almost two fingers long and one finger broad and let there he not into the lower most has piece of wood must be put to that which is uppermost, a most finger broad and let there he not into the lower most has piece of wood with fingers long, and one finger broad, and let there be put into the lower notch a piece of wood with meat at it, so that it may be flightly fasteried to the brim of the uppermost that the meat being pre-sently touched, the other may the easiler fast.

And you may lay a Hone upon the uppermiost board, that it may fall the heavier. And there are some allo which to the lower board do fasten iron piss; made very sharp; against the which the Miceare driven by the Weight of the fall. Furthermore, there is another kinde of trap made to cover them alive, one part of it cut out of a small piece of wood, the length of the paim of thy hand, and the breadth of one finger, and let the other part of it be cut after the form of a wedge: and let the other part of it be cut after the form of a wedge: let this piece of wood be erected like a livile pillar, and let the wedge be put into the north of another prece of wood, which must be made equal with the other; or very little shorter: and this pillar must be so made, that the Moule may not perish before the come to the meat: the wood where the meat must stand, ought to be a span long, and you must fasten the meat about the middle of it, but the former many the many stands and stands he made former part of it must have a cleft, which must begin a little from the brim, and shall be made almost the state of the must have a cleft, which must begin a little from the brim, and shall be made almost the length of two fingers, and you must make it with two straight corners, and take away half the breadth of the wood. These three pieces of wood being thus made ready, thou

There is also another manner of Mouse-trap used among us, which is, let there be a hole made and compassed about with a board of a foot long, and five or fix fingers broad, the compass where of must be four lingers; into this hole leg there be put a vessel made of wood the length of ones fish, or must be rour inigers; and in the middle of each fide of this veffel let there be made a hole, but round and very deep; and made of Iron with meat, and let it be compassed about with a small wherein there is put in a thread made of Iron with meat, and let it be compassed about with a small wherein there is put in a thread which hangeth down thread which must be fastened overthwart the hole : and the part of the thread which hangeth down must be crooked, that the meat may be fastened thereto, and there must be a piece of the thread munt be crooke, which may be tied a stronger piece of wood, which is the thread whereon the without, to the which the Mouse is taken, by putting her head into the vessel to catch

And also Mice are taken otherwise, with a great Cane wherein there is a knot, and in thetopor at the meat. it let there be made a little bow with a Lute string, and there stick a great needle in the middle of the pole of the Cane, and let the pole be made just in the middle, and let there be bound a piece of fielh pore of the Cane, and the take Mouse shall bite, and move the skin, that then the string slippeth down, and so the needle pierceth through his head, and holdeth him that he cannot run away. But among all the rest, there is an excellent piece of workmanship to catch Mice; which I will here fet down: Take a piece of wood, the length of both thy filts, one fift broad, and two fingers thick, and let there be cut off about some two fingers, a little beyond the middle of half the breadth. And that breadth where it was cut, ought to be more declining and lower, after the manner of this letter A. And you must put to the side of this a piece of wood, half a circle long, bending, and in the middle part of each fide holes pierced through, to that the half circle may be itrait, and plainly placed to the foundation of the wood, that the trap being made, it may reft upon the same half circle, and upon this half circle let there be placed Iron nails very sharp, so that the instrument by falling down may cover the Irons of the half circle affoon as ever they touch the fame.

Furthermore, there is another manner of trap, when a veffel out of which they cannot escape, is filled half up with water, and upon the top thereof Oatmeal is put, which will fwim, and not fink, making the uppermost face of the water to feem white, and folid, whereunto when the Moule cometh, the leapeth into the Oatmeal, and fo is drowned : And the like may be done with chafe mingled with Oatmeal: and this in all traps must be observed, wherein Mice are taken alive, that they be presently taken forth, for if they make water in the place, their fellows will for ever super the trap, and never come near it, till the favour of the urine be abolished.

I alladius faith, that the thick froth of Oyl, being infused into a dish or brasen Caldron, and set in the middle of the house in the night time, will draw all the Mice untoit, wherein they shall slick

fast, and not be able to escape. Pliny faith, that if a Moufe be gelded alive, and fo let go, the will drive away all the relidue; but this is to be understood of the Sorex. If the head of a Mouse be flead; or if a male Mouse be flead all over, or her tail cut off; or if her leg be bound to a post in the house, or a bell be hung about her neck, and so turned going, the will drive away all her fellows. And (Plin) sith) that the smoke of the leaves of the Ewe tree, because they are a poyson, will kill Mice, so also will Libbards-bane, and Henbane-seed, and Wolf-bane, for which cause they are severally called Mylly not, and the roots of Wolf-bane, are commonly fold in Savoy unto the Country people for that pur pose.

In Germany they mingle it with Oarmeal, and so lay it in balls to kill Mice. The fume of Wallwort, Calcauth, Parlely, Origanum, and Deaths-herb do also kill Mice: you may also drive them away with the sume of the stone Hæmatites, and with green Tamarisk, with the hoof of a Mule, or of Nitre, or the aftes of a Weefil, or a Cat in water, or the gall of an Orput

The feed of Cowcumbers being fod, and sprinkled upon any thing. Mice will never south it, likewise wilde Cowcumber and Coloquintida, kill Mice. To keep Mice from Corn, make more ter of the froth of Oyl mingled together with chaff, and let them well dry, and afterwards be wrought throughly, then plaister the walls of course and afterward are dry wrought throughly, then plainer the walls of your garnery therewith, and when they are dry cast more froth of Oyl upon them, and afterwards carry in your corn, and the Micemili never

Wormwood laid among clothes, and skins, defend them from Mice: And also the water of Worm-

wood fod, fprinkled upon clothes hath the same operation. Ink tempered with water, wherein Wormwood hath been washed, or fod, causeth that the Parch

ment and Paper written therewith, shall never be eaten, or souched with Mice. Anatolism and Tarentinus, in the discourse of the granery or barn, do write, that Milkshiffe inpled with Hone Warn, and Gas Florida the granery or barn, do write, that Milkshiffe

mingled with Hony, Water, and fine Flower, or Mil-duft, made into little balls, and laid when Mice may eat of it, doth make them blinde if they tall thereof. White Hellebore mixed with pottage, or the feeds of wilde Cowcumber, Coloquintida, and Meal, mingled with black Hellehore, and

Of the Monse. Pur into Cheele or Bread, or any other kinde of far meat, killeth both Rats and Mice. So likewife a white Camelion fod in broth, mingled with water and Oyl, killeth Dogs, Swine and Mice.

The juyce of the root of the herb Camelion, mixed with Water and Oyl, draweth Mice unto it; and killeth them by tasting thereof, if they drink not presently: so also doth Henbane. The roots of the bramble Tree, mingled with Butter, Bread, or Hony, Elecampane, and Sea Onions, Scammony, wilde Sparage, Arlenick, Mug-wort, otherwife called Mouse-wort', mingled with Lard in small pieces, with Auripigment, killeth Wolfs and Mice; and in some Countries, for the better Crescentiendispersing of the poyson, set drink beside the same, whereof assoon as they tast, they swell and die; sis, har I have feen them die without drinking at all. Mice and Wolfs, if they tast of the wilde Rose, and drink after it, do not only die, but also fall into madness and bite their fellows, communicating the quality of the disease to every one they bite. Flesh cut into little pieces, and fryed with Butter Cardan, in a frying pan, and afterwards when it is cold, adde half so much soft pitch thereto, and mingle it together, rowling up the flesh in the Pitch; then distribute it upon little bords, and set it in the place, and places whereunto the Mice do much refort, and water beside it, and when that they have tailed of it a little, they are so eagerly a thirst, that they drink and die.

The like I may say of Rats-bane, Quick-silver, Sublimate, and Precipitate, and divers other

things; and thus much may fuffice for the catching, taking, and killing of Mice, whereunto I may adde the use of their members and parts, not medicinal, but natural, although I have touched it here-

The Scythians were wont to be clad with the skins of Mice and Woolfs, and it is observed, that when Mice cry and screeketh above their ordinary custom, it presageth an alteration and change of the weather; and thus much shall suffice for their natural discourse.

Having thus discoursed of the nature of the vulgar Mouse, I may also add the moral use thereof, The moral storas I finde it recorded among learned Writers, delivered either in History, or in Proverb. It is re- ry of Mice, ported of Glaucus the fon of Minos and Pasipbae; that while he followed a Mouse to take her, he fell into a vessel of Hony; but after Polyades the Prophet, by laying an herb on him, raised him again Tzetzes. to life. Hatto an Archbishop of Meiz in the frontiers of Germany, was destroyed by Mice, or as other fay by Rats: but the words of Textor are:

Hatto Archiepiscopus Moguntinus à muribus fertur devoratus.

And the error may proceed, because that Mus is a general word for the Rat and Mouse; and therefore they which have thought it an unreasonable thing, that so small beasts should destroy so mighty a Prince, have rather attributed it to the Rats then to the Mice; but they ought to have remembred, that itwasan extraordinary judgement of God to punish a cruel covetous, wretch, and that therefore it was easie for him to make the little Mouse his instrument, as the great Rat : for we read, that Herod was devoured by Worms; and other have been eaten up with Lice. Adrian the Pope was strangled by a Fly; and therefore Hatto an Archbishop might aswell perish through the afflicting hand of God by a multitude of Mice.

Heliogabalus that wretch, amongst other his monstrous desires, and Tyrannical commands, Lampridias affirmeth, that upon a time he commanded, that there should be brought unto him tenthoufand Mice alive, a thousand Weesils, and a thousand Sorices, or wilde Field-mice, so base were his thoughts, that while he should have attended his Emperial calling, and hearkened to the suits and complaints of poor distressed subjects, he was busied in killing of Mice, and therefore in antient time, a Moule-killer was taken for an opprobrious speech, for a base, sluggish, and idle

The like is reported of a Muscovian Emperour, who to afflict his people, and to gather mony from them, commanded the Citizens of Musco, to bring him a peck full of Fleas: whereunto the reopleanswered, that if they could take so many, yet could not they keep them together from kaping away. And Mice have been brought into publick spectacle, because at Lavinium they. grawed afunder the thields of filver; and it was afterward judged a prodigy; for there followed the Marfick war. When the Soythians understood that Darius with his great Army, stood in need of viduals, they sent unto him a Provant-master with these presents or gifts, a Bird, a Mouse, a Frog, and five dares. At the receit whereof the Persians wondered what should be meant thereby; and demanded of the messenger the meaning of the mystery. But the Ambassador answered, he knew not any fignification of his prefents, but only received charge to deliver them, and make halt back again, and to bid the Persians, if they were wife, to lay their wits together, to know and understand the meaning thereof. When the Persians heard him say so, they fell to consultation. Darius gave his Herodotus. opinion, that the Mouse, signified the earth; the Frog, the waters; the Bird, Horses; and the Darts warlike furniture and strength of forces, and that the Scythians by sending all these unto them, yeelded that the Persians should be Lords of their Land, Sea, Horses, and themselves, and that therefore they ought to be of good courage.

But one Gobriss, a grave Counsellor, who was one of the seven that slew the Magi, or Wizards, answered otherwise, for his conjecture was more true: for said he; O Perse, nife effects ut aves subpletis in Celum, aut ut Mures subeatie terram, aut ut rane infiliatie in paludes, non remeabitis unde venistie the fagilitie confedit: O ye Persians, except ye become like Birds, to file up into heaven; or like Mice, to creep into the earth; or like Frogs, to leap into the waters, you shall not return hack

Avicen.

Paxausus.

back again unto the place from whence you came, and fo indeed it came to pass. We read I Sam. s. back again unto the piace from whence you taken, and they kept it in their Temple at Hazthat when the Ark of God was taken by the hand of the Lord fell upon their Princes, and he smote them with Emrods, in the bottom of their belly, that is, God punished them with Mice, for he afflicted their bodies, and the fruits of the earth, for which cause cap. 6 they advice with themselves, to send back again the Ark of of the earth, torwinen caute and of the Lord with a present of Golden Mice. Outd, Homer, and Orpheus, call Apollo Smyntheus, for the the Lord with a present or Solden Ruce. Now the faigned cause thereof is thus related by Cretions in ancient time called Mice Sminthe: Now the faigned cause thereof is thus related by

There was one Crish which was a Priest of Apollo; who neglected his daily sacrifice, for the Ælianus: which through abundance of Mice he was deprived of the fruits of the earth, for they devoured which through abundance of blice in was moved; and taking pity of the milery, appeared to one all. At which loss Apollo himself was moved; all. At which 1018 appear infinitely than to tell Crinie, that all the cause of that penury was, for Horda a Neat-heard, commanding him to tell Crinie, that all the cause of that penury was, for that he had omitted his accustomed sacrifice, and that it was his duty to offer them again disgently, or else it would be far worse afterward. Grinis upon the admonition amended the fault, gently, or ene it would be tall the devouring Mice with his darts, whereupon he was called and immediately Apollo killed all the devouring Mice with his darts, whereupon he was called and infinediately opens again fay, that among the Rollians, at Trom and Hamanitus, they worshipped Mice and Apollo both together, and that under his Altar they had meat and nourishment, and al. fo holes to live in fafely: and the reason was; because once many thousand of Mice invaded the corn fields of Eolia and Troy, cutting down the same before it was ripe, and also frustrating the husbandman of fruit and hope: this evil caused them to go to Delphor, to ask counsel at the Orack what they should do to be delivered from that extremity; where the Oracle gave answer that they should go sacrifice to Apollo Smyntheas; and afterward they had sacrificed, they were delivered from the Mice, and that therefore they placed a statue or figure of a Mouse in the Temple

of Apollo.

When the Trojans came out of Greet, to feek a habitation for themselves, they received an Oracle, that they should there dwell, where the Inhabitants that were born of the earth should setupon them; the accomplishing whereof fell out about Hamaxitus; for in the night time a great company of wilde Mice fet upon their bows, quivers, and ftrings, leathers of their bucklers, and all fuch fost instruments, whereby the people knew, that that was the place, wherein the Oracle had affigned them to build the City; and therefore there they builded Ida, fo called after the name of Ida in Greet: and to conclude, we do read that Mice have been facrificed, for the Arcadians are faid first of all to have facrificed to their Gods a Mouse; and secondly a white Florse; and sally the

leaves of an Oak.

And to conclude, Ælianus telleth one strange story of Mice in Heracira, that there is not one of them which toucheth any thing that is confecrated to Religion, or to the service of their Gods, Infomuch, that they touch not their Vines which are facred to religious ufes, but fuffer them to come to their natural maturity, but depart out of the Island, to the intent that neither hunger nor folly cause them to touch that which is dedicated to divine uses. And thus much for the natural and moral hory of Mice; now followeth the medicinal.

The Medicines of the Mouse.

Albertw.

The flesh of a Mouse is hot and fost, and very little or nothing fat, and doth expel black and melancholy choler. A Mouse being flead or having his skin pulled off, and afterwards cut through the middle, and put unto a wound or fore wherein there is the head of a Dart or Arrow, or any other thing what foever within the wound, will prefently and very easily exhale and draw them out of the fame. Mice being cut and placed unto wounds which have been bitten by Serpents, or put to place which are stinged by them, do very effectually, and in short space of time cure and persessly best them. Mice which do lurk and inhabit in Houses, being cut in twain, and put unto the wounds which are new made by Scorpions, doth very speedily heal them.

Marcellus. Dioscorides.

A young Mouse being mingled with Salt is an excellent remedy against the biting of the Mouse called a Shrew, which biting Horses and labouring Cattel, it doth venome until it come unto the heart, and then they die, except the aforesaid remedy be used. The Shrew also himself being bruifed and laid unto the place which was bitten, is an excellent and very profitable remedy against

Pliny. Marcellus.

A Mouse being divided and put or laid upon Warts, will heal them and quite abolish them, of what kinde foever they shall be. The fat which is distilled from Mice, being mixed with a little Goofe-greafe and boyled together, is an excellent and medicinable cure for the alwaying and mollifying of fwellings and hard lumps or knots which do usually arise in the fieth. Young heing bearen into four history and hard lumps or knots which do usually arise in the fieth.

Pliny.

being beaten into small bits or pieces, and mixed with old Wine, and so boyled or baked, unil they come unto a temperate and mollifying medicine; if it be anointed upon the eye-lids, it will very easily procure hair to grow thereon. The same being unbeaten and roasted, and so given to little children to eat, will quickly dry up the froath or spittle which aboundeth in their mouth. That are certain of the wills man or Mark. are certain of the wife men or Magi, who think it good that a Moufe should be flead, and givento those which are troubled with the Tooth-ach, twite in a month to be eaten. The water wheten a Month herb bear for the troubled with the Tooth-ach, twite in a month to be eaten. in a Mouse hath been sod or boyled, is very wholesome and profitable for those to drink who are troubled with the inflammation of the jaws or the difease called the Squinty.

but especially those of Africk, having their skin pull'doff, and well steeped in Oyl, and rubbed with Salt, and fo boiled, and afterwards taken in drink, are very medicinable for those which have any pain or trouble in their lights and lungs The same medicine used in the aforesaid manner is very Pliny. profitable for those which are troubled with a filthy, mattery, and bloudy spitting out with

Of the Monse.

Sodden Mice are exceeding good to restrain and hold in the urine of Infants or children being too abundant, if they be given in some pleasant or delightsome drink. Mice also being cut in twain. and laid unto the feet or legs of those which are gowty is an excellent remedy and cure for them. Mice being dryed and beaten to powder, doe very effectually heal and cure those which are scalded or burned with hot water, or fire. Cypres nuts being burned and pounded, or beaten into dust, Marcellus. and mixed with the dust of the hoof of a male or female Mule, being dryed or stamped small, and the Oyl of Myrtle added unto the same, with the dirt or dung of Mice being also beaten; and with the dung of a Hedge-hog new made, and with red Arfenick: and all mingled together with Vinegar, and moift or liquid Pitch and put unto the head of any one who is troubled with the abundance and loofe hanging down or over-growning of his hair, it will very speedily and without any difficulty eafe him of the fame.

The dust of a Mouse pounded and beaten to powder, and mingled with a certain Oyl, is very good and wholesome, for those which are grieved with a Tetter or icab, which may over-run their whole The brains or tail of a Mouse being dryed and beaten to powder, is very medicinable for Pliny, those which are troubled with the casting and shedding of their hair; as also for the disease called the Foxes evill; but this operation will work more effectually, if the shedding of the hair doth happen by any venom or poyfon. The fame in operation hath the whole body of the Moufe being

used in the aforesaid manner.

There is also another excellent remedy to cure and heal the aforesaid disease, which is this; To Galen. take Mice which inhabit in houses, and to burn or dry them in a pot, and then beat them; and being so used, to mix them with Oyl of Lawrel, and to rub the hairs which are like to fall or shed with Garlick; and to put them all together into a Frontlet or fore-head cloth, and daily to keep the fame medicine or plaister unto them, until the hair do grow fast, and they be rid of that disease. There is also another remedy for the same disease, which is this: To burna Mouse, and beat him into powder, Galen.

and then to mingle the fame with Hony, and the greafe of a Bear, and so to anoint the head, and this saccounted for a very speedy and effectual cure!

The dust or powder of Mice being mixed with Hony and Oyl of Roses, and so baked, or boiled Pliny. together, and afterward diffilled into a clear water, and to poured into the ears of any one which is def, or troubled with any pain in his ears, and it will quickly bring him help and remedy. The dust Marcellus. of adryed Mouse being also mingled with Hony, and rubbed upon the teeth of any one which is troubled with a stinking breath; will presently take away the savour thereof. If the urine of a man or woman be too fluent and abundant, let them take the dust or powder of a dryed Mouse, being besten and stamped, and mix it with Winesor with Goats milk, and so drink it up, and he shall speedily have remedy. The grievous and violett inflammation or turning of the eye-lids, is cured after Galen. this manner: First, they take the fielh of the Mice, assoon as ever it is beaten small, and mingle it with the yolk of an Egge, and mollifie it into a falve or plaister like unto wax, and then put it into a linnen cloth, and so wrap it upon the eye-lids in the time of fleep, and it will easily bring help and

There is an excellent remedy for the over-spreading of the eyes, or to cure the disease in them. called the Pinand the Web; of to help them which are altogether blinde, which is this: To take the bloud of a Mouse, the gall of a Cock, and some part or quantity of womans milk, and to take of each of them alike, and then to mingle or mix them together, and being well wrought or kneaded until it come to an ointment, to rub or spread it upon the eyes: and this will in very short space help them

unto their fight; for it hath been tryed; and hath helped many The skin of a Mouse being burned or dryed, and beaten into powder, and so mingled with Vine- Galenus. gar, and then abointed upon the head of any one who is pained or troubled with the Head-ach, it Paral. 3.16. wil presently ease and help him. The head of a Mouse being also born or carryed in a linnen cloth, Pliny, doth cure the same disease: LThe heads of Mice being burned, and beaten into small powder, and then mixed or mingled with Hony, and lo anointed upon the legs or feet of them which are troubled Galenus. with the Gowt, are excellent good and wholesome for the curing of that grievous disease. The same vertue hath the tails or bodies of Mice, being used in the aforesaid manner in them. Some do Pliny, think, that the aforesaid disease is more speedily and effectually cured after this manner : First, to the a Beetle or Horse-fly and samp it all to pieces, and then to mingle it with fost and liquid Pitch, the skin being prepared or made ready with Nitre: but there must be great care taken, that it eat not too far in the flesh: then to take the head of a Moule, and the gall and dung of a Moule, and mingle them together with Ling wore and Pepper, and so to amoint them, and spread them upon the aforesaid eaten or lanced wounds: and this is very much commended for a very good and intelliging. ble cure for the aforesaid disease.

The heads of Mice dryed and beaten into powder or duft, and then mixed with Hony, and to Sextur. anointed upon the eyes for the space of ten days together, will clarifie the eyes, and expet all pain or blemithes from them... Of the heads of Mice being burned, is made that excellent powder, Pliny. for the feowring and clenfing of the teeth called Tooth-foap : unto which if Spikerlard be

Scholiaft. Lic.

Marcellus.

added or mingled, it will take away any filthy fent or strong savour in the mouth. The brains of added or minged, and put or steeped in Wine, and stamped, and beaten small, and anointed upon the brow or tore-head of any one who is troubled with a pain or ach in the head, and he shall soon finde ease and remedy. If any man shall but touch or kiss with his mouth the snowt or nostrils of a Mouse, and be troubled with the disease called the Rhume, which falleth down and stuffeth the notheris, he shall in very short space be eased of the same. The Magi or wise men do very much commend this medicine for the expelling of a quartain Ague or Fever, which is thus; To take the note or snowt of a Mouse, as also the very tops of the ears, and bruise them together, and after. ward tie them in a linnen cloth, which hath had Roses or Rose-leaves in the same, and then binde them unto the arms or wrifts of him which is fo troubled, and they will very effectually and foce. dily sure and heal him. For the rottennels and deminishing of the teeth, the best remedy it to take a living Mouse, and to take out one of her teeth, whether the greatest or the least it is no great marter, and hang it by the teeth of the party grieved : but first kill the Moule from whom you had the cooth, and he shall presently have ease and help of his pain. The heart of a living Mouse being taken out, and hanged upon the left arm of any woman, is of fuch force and power, as it will cause her never to conceive. The laps or fillets of the liver of a Mouse, being beaten small and mingled with four drams of fowre and unpleasant Wine, is an excellent remedy for those which are troubled with quakings in their joynts, as also for Fevers and shaking Agues. A Mouse being cut or parted in the conjunction of the Sun and the Moon; and the liver pulled out and roafted or boiled, and given to one which is troubled with the aforefaid dilease to eat, will very speedily and without any difficulty or pain cure and heal him of the same. The gall of a Mouse being beaten very fmall, and steeped or washed in Vinegar, and so poured or distilled into the ears of any one who is deaf or thick of hearing, or hath any ach or pain in the same, is counted for the chiefest, and most singular and chiefest remedy or cure which is used for the same.

The dung or dirt of a Mouse being new made, is very profitable for those which are troubled

with the difease called the Sciatica, or Hip-gowt, anointed or rubbed upon the same. Mouse-dung

being also mingled with Vinegar and Oyl of Roses, and so anointed or spread upon the fore head or

temples of any one who is troubled with the head-ach, will presently ease and help him of the sme. The gum called Benzoin being mixed with Wine and Safron, and Pepper; as also with the dirt or dung of Mice being new made, and mixed with Vinegar, and mingled all in one medicine, and fo

strained and given to one to drink, which is spare and lean, in some shore space or time it will make The dung or dirt of a Mouse being mingled with certain other medicines, is very good and

wholesome for those which are troubled with Tenters, and dry scabs which over-runthowhole The dung of Mice being mingled with the dult, or powder of Frankincenfe, with a little red

Arfenick added thereunto, is a very profitable and wholesome medicine for those to use which are

troubled with little hard red bunches and swellings atiling in divers and several parts of the body. Seven pills being taken out of the dung of a Moule, and mingled wish Vinegar, and anointed upon the fore-head and temples, of those which are grieved therein, will very speedity help and

The inward parts of earth mixed with Mouse-dung, white Pepper, and Myrrhe, beingof each of them half an ounce, and afterwards mingled with Vinegar all together; and so anointed upon the

head of any one which is troubled with the Megrin, will very effectually and speedity esteandrid him of the same. The herb called Strumus bearen together with Mouse-dung, and afterwards

mixed with Vinegar, is an excellent remedy against the swellings in the head, or little hintches which

ariting therein become fores, and are full of matter and filthy corruption. The dung or dirt of Mice being melted, diffolved, and mingled with Vinegar, and then rubbed upon the head of any one who is troubled with the fourf or skaples that each in a bathe or stone, will prefently expelled The dung of Mice being mingled with Frankincenfe, and fo beaten or tempered together until they come unto the likeness or thickness of Hony, and then anointed upon the legson feet of any one that is troubled with the Gown, he shall finde present help and remedy. The famedicale also is very effectually cured by the dung of a Moule, and burned on scorched Barley mingled to gether, of each being the same weight or quantity, and afterwards mixed with Vinegataltogether and to forest or analysis and to forest or analysis and to forest or analysis and the fo ther, and fo fpread or anointed upon the difeafed parte. There is also another excelent remedy, for curing of the aforefaid difease, which is thus, To take Cantharides, and broke themal to pieces, and mingle them with foft on liquid Pitch, and also with Nitre, and so anoint or ubthen upon the skin being prepared for the purpose; but there must be great care had, that the skin be not rubbed or lanced too far. Afterwards unto the wound fo made, shere must be taken the beats, galls, and dung of Mice, being mixed with the herb Lingwort, and Peppen; and so heaten all toge ther until they come unto a temperate salve or medicine, and then anointed upon the said wounds, and they will in very short space cure the same. The bairs and dung of a Moufe, parched or dryed by the fire, and anointed upon the eye-lide of any one which are pield or bare, will prefently procure hair to grow thereon. Moufe-dung being dryed in the shade is an excellent remedy against the voiding or spiring fame is also very good to stanch the bloud which issueth from wounds being new made. White Sceny-feed, and the dung of a Mouse or Hare being put into broth, with the stem or falk of Fennil, and so boyled together, and afterwards given unto a woman to drink who is destitute of milk in her breasts, will presently and very speedily procure her milk in great abun-

The dung of Mice being Reeped or washed in rain water, doth ease and refresh the swelling of Screenes. womens dugs in their time of delivery. The dung of a Moute being given in any drink or liquor to one that is troubled with the disease called the Colick and stone to drink, will in very thort space or time cure him of the same. Mouse-dung being also taken in drink, doth loose short space or time care him of the lame. Moule-dung being also taken in atink, doth loose the body of either man or woman, how fall foever they be bound. There is an excellent remedy arising from Mouse-dung against the Sciatica, or Hip-gowt, which is this: To take nine grains of a Marcelus, Moules dung mixed or mingled with half a pinte of Wine, and given to the party grieved upon a bench or foot-stool to drink, so that he drink it standing upon that foot only which paineth him, even at the San rising, and having so drunk it, let him leap down, and affectivated let him leap Disserted. three times, and let him do this but three days together, and he hall have prelent help and remedy of his disease.

Mouse-dung mixed with Frankincense and sweet Wine, and so drink by any one which is trou- Autoen. bled with the Colick and Stone, will presently ease him of the fame. But the dang of Mice mingled with Frankincense, Water, and Hony, and so boyled together, and drunk, doth not only drive away the pain of the aforesaid disease, but also doth break and quite distolye the Stone. Mouse-dung also being taken in drink by it self alone; doth dissolve and melt the Stone in the Bladder. The Pliny. same being also boyled in water, is very good and profitable for those which cannot make water. The same being new made and anointed upon the belly of any one who is troubled with the Colick or Stone, shall finde present ease and remedy thereby.

There is yet moreover another excellent medicine proceeding from this dung, whereby the finit in a womans womb may be brought forth either dead or putrified without any hurt or prejudice unto the woman, which is thus; First to take Egyptian Salt, Mouse dung and Gourds which are fowen Hippocrates. to the woman, which is thus; First to take respitan Sait, Mouse, aung and Courtes which are lower in Woods, and afterwards to pour in half a pinte of Hony, being half boyled, and to cast one dram of Rozen into the Hony, the Gourds, and the Mouse dail, and beat them well and throughly together, and then rowl them up, and fashion them in the manner of Accours, and put them to the belly of the party to grieved as often as you shall think it meet and convenient and in using this some short state or time, you shall see the aforesaid putrified that to proceed and iffue forth.

Mouse-dung being parched or burned, and mingled with Hony, is very good and medicinable Avicen. aswell for those which are troubled with the swellings in their legs and feet; as also for those whose eyelids are pilled and bald, to make hair to grow again upon them, being spread or anointed thereupon. The dung of Mice being dryed and beaten into small dust or powder, and put into the teeth of any one which are hollow, will presently expel away all pain from them, and also confirm and make the teeth strong. The dust or powder which proceedeth from Mouse-dung, is also very good Marcellus. to cure any disease in the fundament of either man or woman.

The urine of a Mouse is of such strong force, that if it shall but touch any part of a mans body. it will eat unto the very bones. The bitings of Mice are healed by no other means but by green Figs and Garlick being mixed or mingled together, and fo anointed thereupon.

of the RAT.

There is no doubt that this Beast belongeth also to the rank of Mire, and the name thereof we have showed already, is common both to the French; Spanish; Italian, and English, and it Rayor great may seem to be derived from the Greek word Rasses, or Henrek; or Rispo, for the Greetiaus infe domentical all those words. And this beast is sour times so big as the common Monse; being of a blackish Mosses down the belly, having a long head inder much unlike the head of the of Rass and Martin; short and round ears, a reasonable rough skin, short legs, and song claws, and exceeding steat eyes, such as can see very perfectly in the dark night, and more perfectly then by, caudic light; with their nails they climbe up steep and hard walls, these trail is very long, and almost to partake with the nature of Serpents. The quantity of their body is much like a Weefill; and sometime you shall see a Rat exceeding the common stature, which the Common call Raisen Rus. to partake with the nature of Serpents. The quantity of their body is much like a Weelils; and sometime you shall see a Rat exceeding the common stature, which the Germani call Ratesy Kunighte King of Rats, because of his larger and greater body; and they say that the selfer bring him meat, and he lyeth idle. But my opinion is, that as we'read of the Dor-moule, she nourished her parent when side is old; to likewish the Wounger Rats bring stood unto the elder, because through their are; they are no in the wife the Wounger Rats bring stood unto the elder, because through their are; they are no interimed the wife Rats, as was once seen in Germany, takeny meddy shure of body. Sometimes you shall be wiste Rats, as was once seen in Germany, takeny beard. And are abstract in Germany, about the Temple casted the Church of S. Hylaric, they abound in greater number their in other plates. They do not lie in the earth like Mice, except in the vally of sachim, where for the Summer time they sortake houses, and go into Cony holes, but

Alexius Pedemontants.

Mouse-dung being dryed in the shade is an excellent remedy, against the volume of bloud which slowesh from some parts of the body, but especially from the belly. Since

but in the Winter time they return to the houses again. They are more novsome then the little Mouse, for they live by stealth, and feed upon the same meat that they feed upon, and therefore as they exceed in quantity, fo they devour more, and do far more harm. They are killed by the same poysons and meats that the common Mice are killed, except Wolf-bane; for if they eat thereof, they vomit it up again, and are fafe. They are also taken in the same traps, but three or sour times so big: Their flesh is far more hot and sharp then the flesh of the vulgar Mouse, as we have gathered by the diffection of it, and therefore in operation it is very like that it expelleth and dryeth more then the

Medicines by Rats.

Poylon of

The excrements are also of the fame vertue; and with the dung of Rats the Physicians cure the falling off the hair. And it is said also that when they rage in luft, and follow their copulation, they are more venemous and dangerous then at other times. For if the urine do fall upon the bare place of a man, it maketh the flesh rot unto the bones, neither will it suffer any fcar to be made upon the ulcer; and thus much of the vul-

of the WATER.RAT.

Names of Wa. Seeing there are two kindes of terrais. Seats, one of the earth called Railm terrestrie, and the other of the water called Rattus Fluviatilis, of which we are now to entreat, being also called of the Latines, Mus aquaticus; by the Germans, Twaffermam, and Wafferrat; by the Italians, Sorgomogange; by the French, Rat d'eau. This beaft hunteth fishes in the Winter, and have certain caves in the water fides, and banks of the Rivers or Ponds: For which occasion it being seen in the waters, deceiveth their expectation which look for the return of it to the land. And this beaft hath been forgotten by the Ancients, for they have left

termats.

A wonder in female Rate

of it no description nor story, because it liveth partly in the water, and partly on the land, and therefore he faid true, that spake of the habitation and place of abode of this beat, in this sort, Places of Wa- Ego non in fluviti, nec alite aquie magnis, sed purvis tantum rivie atq; herbests omnium ripis boc atteriats abode. mal frequentification and average waters of the contract of ter-rats abode. mel frequent/simum versari andio. That is to say; That this beast doth not keep in great Watersot Rivers, but in small and little currents and Ponds, where abundance of grass and other weeds do drow on the sides and banks. Plint constitutions, where abundance of grass and other weeds to drow on the sides and banks. Plint constitutions, where abundance of grass and other weeds to the grow on the fides and banks: Pliny attributeth that to the Water-rat, which is proper to the Portroife, for indeed should be a proper to the control of the water-rat, which is proper to the control of the water-rat, which is proper to the control of the water-rat, which is proper to the control of the water-rat, which is proper to the water-rat, which is proper to the water-rat of the water-rat Tortoife; for indeed there is some similitude of natures bewirt these beasts, with this exception, that the some similitude of natures bewirt these beasts, with this exception, that the females in this kinde have three visible passages for their excrements, one for their wine, Of the Alpine Monfe.

another for the dung, and the third for the young ones, that is a pecuhar place for the littering of their young ones, and this Water-rat over and beside her common nature with other Rats, doth fwim over Rivers, and feed upon herbs; and if at any time she be hunted from her native biding and accultomed lodging, then also she goeth among vulgar and common Rats and Mice, and feedeth unon fuch as they eat : and (Bellonim faith) that there are great store of these in Wilm and Strymen, and that in calm nights when there are no windes, they walk to the flores, & get up upon the banks, eating and gnawing fuch plants as grow neaf the waters; and if they hear any noise, they suddenly lean into the waters again. He expresselt asto the figure of this Rat, which we have omitted because it resembleth in all parts the common Rat, excepting the snowt or beak which is rounder or blunter. Among some of the Ancients also, there is mention made of this bealt, and no more. Therefore Ariftotle faith in the Arcadian Lufe, which is a City fo called, (as Stephanu writeth,) where Malampus did wash the daugliters of Praim, and delivered them from their madness: There is a certain Fountain, wherein do live Rats of the Earth, (they should say Rats of the Water.) for hereunto agree both Pimy and Theophrafim. Likewife in a River of Caffinus, the ancient Wife-men, which were followers of Zorouftres, made great account of the Hedgehog, but hated deadly the Waterrats, and faid, that he that could kill most of them, was most dear and acceptable to God. And furthermore they faid, that Dogs, Hens, and Hedgehogs, did proceed, and were attended from and by good Angels, and Water-rats by evill. And thus much shall suffice for the discourse of the Rat. The itory which ensueth is of strange and less known Mice; and therefore I will distribute them after an alphabetical order, according to their feveral names.

Of the ALPINE MOVSE.

THe Alpine Moule taketh her name from the Alper, wherein the is bred, and aithough there be many other kindes of Mice bred in the Alpes, yet this being the principal thereof, receiveth denomination from the Mountains, because they are bred in the very tops of the Mountains, and seldom or never come down to the roots. The Italians call it Marmota, and Murmont, and according to Matheelus, Marmontena ; the Rhatiant, Montanella ; and in fome part of Italy, Varrefa ; in France, Marmote ; although Marmot be also a word among them for a Munkey. The Germans, and especially the Helvetians, by a corrupt word drawn from a Moule of the Mountain, Murmelibier, and Murmentle, and fome Milibettele, by reason of his sharp whining voyceilke a little Dogs. In Latine it is called also Empra, which seemeth to be compounded of Embder, and this is the least kinde of Alpine Mice, which is found in all the German Regions; of which we will speak in the end of this story. Some take this to be called Taxus; amonght, whom Braffevolus is one; yet it hath no property with the Alpine Moule, except lying in a Cave; forit doth not fleep in the Winter, nor hath no outward refemblance with Mice, neither can have any affinity in disposition or manner of living, and therefore I cannot assent thereto. Grapuldus & Alannus, both learned Italians, say, that the Armelius are called Alpine Mice, whereunto they are led, because they sleep all the Winter long, like the Alpine Mouse; but we shall shew in their due place, that theie belong to the Weefils, and not to the Mice, which living in cold Countries, grow white in the Winter time : the Hebren word is Sophan, according to fome Authors, and is translated Archenim, but we will fhew in due place, that the Arktomys is the Crocetus, or Grycet Moule, and the Saphan we have shewed already to be the Cony.

Thefe Alpine Mice are in the tops of the Apennine hills, and none of the Ancients except Pliny make mention thereof, andie is donbtful whether he doth describe it or no. For his words are , Sum bie Muribus Alpinin pares & in Rappio, similiterq, residunt in clunibus & binis pedibus gradiuntur, prioribusq, ut manibus usumer, that is to fay, there are Mice in Egypt like to the Alpine Mice; for they fit upon their buttocks, and go with their fore-most two feet, which also they use instead of hands; by which we collect, that they are not the same, but like the Alpine Mice.

The Alim Moule is in quantity like a Hare, or at the least betwirt a Hare and a Cony, being The quantity more fat, and of a thicker body then a Cat, but shorter legs, in outward appearance most like a of this beat, Moule, and therefore it is called an Alpine Moule. The back of it is very broad, and the hair harder and the feveral and harfier then a Conies. The colour for the most part is yellow, which in fome is more clear parts. and in others more obscure and brown. Their eyes of a reasonable quantity, standing far out of Matheolus. their heads. Their ears very short like cropt ears. The head like a Hares, and their feet with long neils; his fore-teeth like a Squirrels, two above, and two beneath, but long and fharp like a Beavers, in colour yellow; about the nose and upper lips he hath long black briffle hairs like a Cat. The tail is half a cubit long, according to Stumpfius, but two palms according to Agricela. His kgs very frort and thick, covered with long deep thick hair, like to the bottom of his belly. The toes of his feet are like a Bears, and his claws long and black, wherewithall he diggeth the earth to make his den; he goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and with his term and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, or like an Ape, by jumps, and the goeth upon his hinder-feet like a Bear, and the goeth upon his hinder-feet like a Bear like and the goeth upon his hinder-feet like a Bear like and the goeth upon his hin with his first feet he taketh his meat like a Squirrel and an Ape, sitting in the mean time upon his burrels burrels by buttock. His back is also very fat, although all the other parts of his body be lean; and yet that on his back is also very fat, although all the other parts of his body be lean; and yet that on his back cannot be faid to be fat, but rather like a Cows udder, neither fat nor flesh, and they encrease and a second crease or grow more in breadth then in length.

Scaliger describeth them in this manner, a Marmot (faith he, for so he tearmeth an Alpine Mouse The description of the great in French) is a Beast about the bigness of a Badger, having hair and tail much like it; and after on of the great the Alpine Mouse.

the fame manner fhort legs, and little or no ears, long, fharp, firm, crooked, ftrong and black claws, which is numbred amongst the kindes of Mice, with whom it holdeth little correspondence, except

that like a Squirel it taketh his meat in the fore-feet as with hands, and eateth fitting upon his tail. They agree also with the Dor-mouse in their sleep, for they pass over Winter sleeping. Their teeth are like to the teeth of Hares and Mice; after that they are made tame, they are not hurtful to men or children, except they be provoked. Being kept in houses, they will eat and gnaw all linnen and woollen cloth; thus far Scaliger. But we have shewed already, that the outward appearance of it is like a Mouse, and that therefore it is fafer to follow Pliny, Albertus, Mathaolus, Stumpfius, and others, then his fole and fingular The places of Opinion; they keep as we have their abode, and faid already, in the tops of the Mountains, wherein they make their fingular art in making their cave with wonderful art and circumspection, making two different paffages into their Den. one above another a poles length, which meet in the middle like a fork, or the conjunction of two Rivers or Path-ways, making the feat of their rest to be very deep in the Mountain, and therein they

Their observa-

their cave.

remain five, seven, nine, or eleven of them together. They play many times before tion of watch, the mouth of their Den together, and in their sport or pastime, bark like little Dogs. When they go out of their cave into the Mountains to gather food, or to play, or to fetch in grafs; always one of them remaineth like a Watchman near the mouth of the cave upon fome high place, looking most diligently and vigilantly, both far and near ; and if he fee either a man or wilde beaft coming towards them, then he fuddenly cryeth out, and with his voyce giveth the warning word, whining like the whisling of a pipe, if his fellows be far off; or elfe barking like a Dog, if they be near at hand. When the residue hear it, they presently repair home, and he which kept the watch, entereth into the Den last of all. And it is reported by a certain Greek Writer, that if their speculator do not give them the watch-word, but that they are endangered by any man or beaft through his negligence', they tear him in pieces with their teeth. There is no beaft The firength fo firong as this, confidering the

quantity; for it hath been feen, that when a lufty young man took one of them by the binder

leg as it ran into the Den, he could not with all his might pluck it back again. The claws of it are exceeding sharp, and fit to dig; so that it is thought if a man finde them in the earth, and seek to take them by digging unto them, the shall labour in vain, because the Beast diggeth faster from him then he can follow her; they cannot run very fast in the plain ground, but are easily killed by a man, except they get into the earth: with their teeth they bite deep, for they can sheer asunder wood with them they get into they eat or live upon fruits, and especially being tamed when they are young; they Their several refuse not bread, flesh, fish, or pottage, and above all they desire milk, butter, and cheese; for in food, the Alper they will break into the little Cottages where milk is kept, and are oftentimes taken in the manner fucking up the milk, for they make a noise in sucking of milk like the pig In the moneth of Mer they are much delighted to gat Hornets, or Horse-flies, also they feed upon wilde Sagapen of the meddow, and feeded Cabages, and while they are wilde in the Mountains, they never drink : the reason is, as I suppose, because in the Summer time they eat moist green herbs, and in all the Winter time they fleep.

Towards the feast of Saint Michael the Archangel, and of Gallus, they enter into their Caves; and as Engrance Into Plin faith, they first of all carry provision of Hay, and green Herbs into their Den to rest upon, their cares, wherein their wit and understanding is to be admired; for like Beavers one of them falleth on the back, and the residue load his belly with the carriage, and when they have laid upon him sufficient, he girteth it fast by taking his pail in his mouth, and so the residue draw him to the Cave; but I cannot affirm certainly, whether this be a truth or a fallehood. For there is no reason that leadeth the Author thereunto, but that some of them have been found bald on the back. But this is certain, when the Snow begins to cover the Mountains, then do they enter into their Dens, and thuc up close the passages, with sticks, grass, and earth, both so hard and so thick, that it is easier to break the folid ground, then the mouths of their Caves, and so being safely included, both from the fear of the Hunters, from rain, fnow, and cold, there they live until the Spring, without all manner of meat and drink, gathered round together like a Hedgehog, fleeping continually; and therefore the people inhabiting the Alger have a common proverb, to express a drowfie and fleepy fellow in the German tongue thus; Er muffe fuzyt geschlaffen baben wie ein murmeltbier: in Latine thus; We Their conticeffe babet tertum, dormiendo, tempus consumere, infar murte Apini. He mustrnoeds sleep a little, like nual sleep all the Mouse of the Alpes. They sleep also when they be tamed, but it hath been found by experience, the Winter that when a tame one hath been taken a fleep, and laid in a warm barrel upon Hay, the mouth be- time, ing thut and closed to keep out rain and snow, at the opening thereof it was found dead; and the raion was, because it lacked breath, and therefore this is most wonderful, that in the Mountains, mwithflanding the close flopping of the mouth of their Caves, yet they should not be deprived of refrigeration, that is, fresh air, for expiration, and respiration.

But this is to be confidered, that after they have been long tamed, they fleep not fo much as when they are wilde; for I think that their continual eating of raw and green herbs, ingendereth in them fommy humors as cannot be differfed without a long continuing fleep; but afterwards when they and so the effect ceaseth. During the time that they sleep, they grow very fat, and they are not Growing fat awaked very easily, except with the heat of the Sunor fire, or a Hot-house. Now the manner of with sleep. their taking while they are wilde, is thus;

In the Summer time when they go in and out of their Caves, they are taken with snares fet at Thetaking of the mouth thereof; but in the Winter time, when they go not abroad, then also are Inhabitants these beatles. forced to another devise, for then in the Summer time, they fet up certain pillars or perches near the mouth of their Den, whereby they may be directed, when the show doth cover the Mountains. For the pillars or poles stand up above the snow, although the snow be very deep. Then come the Inhabitants upon round pieces of wood in the midft of the Winter, fastned to their shooe-foles over the deep mow with their pyoners and diggers, and cast away the fnow from the den, and so dig up the earth, and not only take the beafts, but carry them away sleeping, and while they dig; they diligently observe the frame and manner of the stopping of the Mouses den. For if it be long and deep, if is a fign of a long and a hard Winter, but if they be shallow and thin, of the contrary: fo coming upon them as we have faid, they take them and carry them away afleep, finding always an odd number among them, and they diligently observe, that whilest they dig, there be no great noise, or that they bring not their fire too near them. For as Stumpfius faith, Expertell enim capi non possum, or that they bring not then the too heat the foliendo simul & retrocedunt & pedium quam estaderint, terram rejisiendo fossorem impedium. That is to say, If they be once awaked, they can never be taken, for howfoever the Hunter dig never fo manfully, yet they together with him, dig inward into the Mountains, and raft the earth backward with their feet to hinder

Being taken as we have faid, they grow very tame, and especially in the presence of their keep. Their taming ers, beforewhom they will play and sport, and take lice out of their heads with their fore-feet like and conditions an Ane Taken they will play and sport, and take lice out of their heads with their fore-feet like and conditions and the sport and take lice out of their heads with their fore-feet like and conditions. an Ape. Insomuch as there is no beast that was ever wilde in this part of the world, that becometh in the honse. fo tame and familiar to man as they; yet do they always live in the hatred of Dogs, and oftentimes bite them do not be they always live in the hatred of Dogs, and oftentimes bite them deeply, having themat any advantage, especially in the presence of men where the Dorg dare not reful nor defend themselves. When they are wilde they are also killed affeepiby putting of a knife in the present affeepiby putting of t knife into their throat, whereat their fore-feet fir a little; but they die before they can be twaked

Stumpsius. of this Beaft,

Of the Dormonse.

The faving their ficft.

Their bloud is faved in a veffel, and afterwards the Mouse it felf is dreffed in hot scalding water Their bloud is laved in a verier, and are the and then do they appear bald and white; next to that like a Pig, and the hair thereof plucked off, and then do they appear bald and white; next to that like a Pig. and the nair thereor plucked on, and take put in the bloud again into their bellies, they bowel them, and take out their intrails: afterwards put in the bloud again into their bellies, they bowel them, and take out their intended and hand them up in fmoke, and being dreffed after they are and to teethe them, or ene sait them, and hang them by with Rapes and Cabbages, and their field dryed, they are commonly eaten in the Alpine Regions with Rapes and Cabbages, and their field is dryed, they are commonly eaten in the August Region of Lambs, but a folid fat, like the fat of Hogs and very fat, not a fluxible or loofe fat like the fat of Lambs, but a folid fat, like the fat of Hogs and Oxen. And the flesh hereof is commended to be profitable for Women with childe; and also for Oxen. And the nein nereor is commended to be profitable to be eaten in mean, but also the fact to be all windiness and gripings in the belly, not only the flesh to be eaten in mean, but also the fact to be all windiness and gripings in the beny, not only aude it is used to procure sleep, and to strengthen anointed upon the belly or navil: And for this cause it is used to procure sleep, and to strengthen anointed upon the beny of navil. Allow to the fact of then fresh, because the falt drieth up the decayed and weak sinews: the sless is always better salted then fresh, because the salt drieth up the decayed and weak innews: the nem is always between and ranckness of the savour: but whether it overmuch humidity, and also amendeth the gravity and ranckness of the savour: but whether it be falt, or whether fresh, it is always hard to be digested, oppressing the stomach, and heating the body overmuch.

The descripti-

on of the Em-

Alpine Moule.

Albertus.

ody overmuch. The ventricle or maw of the Moule Alpine, is prescribed to be laid upon the belly against the Co-The medicines of this beaft, it is faid he shall be the betterable of this beaft, it is faid he shall be the betterable to endure cold all that day after: Also the same sat being drunk up in warm broath by a woman in travail, are believed to accelerate and haften her delivery.

Certain Horse-leeches, in the cure of that disease which they call the Worms, which are certain ulcers rifing in the body, do mingle this fat with other medicines which are very drying or fliptick. And Matheolise doth prescribe it for the softning and mollifying of contracted nerves and joynts

By the discourse aforesaid, it doth appear, that of these Alpine Mice there are two kindes, one great like a Badger, and the other in stature of a Hare or Cony : This lesser seemth to be proper to Germany, which there they call Embdor, of the Latine word Empira, a Moule of the Mountain.

The story whereof I thought good to express, being short, out of Stumpsine and Agricule. The males and females fay they of this kinde, do gather together wilde corn which groweth among the Rocks in the Summer time against the Winter, and carry the same into the holes of the earth,

where their lodging is.

Now the female in this kinde is crafty, and more apt to devour; the male on the other side more thrifty and sparing, wherefore he driveth his semale out of the Den in the Wintertime, and stoppeth the mouth of his Cave, to forbid her entrance, but the getteth behinde the sime, and diggeth a secret hole, whilest the male lyeth at the mouth asleep, the consumeth the whole store behinde him; wherefore in the Spring time the cometh forth very fat and comely, and he very lead. And therefore in my opinion, the makers of emblems may very well describe an unthrity Wife, that consumeth her Husbands wealth, by the picture of this female, as by the picture of the As behinde Oonm, biting afunder, the cord that he weaveth, as we have shewed before in the History of the Als. These bealts give themselves much to sleep, and when they are awake they are never idle; but always carrying into their Den straw, hay afficks, rags, or pieces of cloth, wherewith they fill their mouth fo full, that it may receive no more, and if they meet with any thing which is too big for their mouth, by the help of their feet they draw and rowl it to their own Den.

Whereas they are nourished tame in houses, it it is observed, that they are a near and cleanly kinde of beaft, for they never defile their lodgings with their excrements, but feek out fome fecret corner, wherein they both render urine, and empty their bellies. With their teeth the gaw wood, and make holes in bords, fo large as their bodies may pass through; and while they live, they have a very ranck and frong favour like a Moufe, especially in the Summer time while they are lean, and before they grow fat; for such is the nature of this beast, that in the Summer time they labour and grow lean; but in the Winter time they sleep and grow fat. And thus much for

the Alpine Mouse.

Of the DORMOUSE.

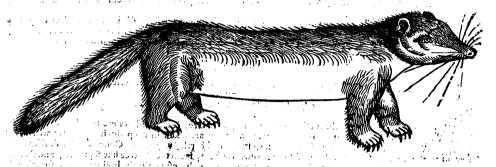

The names and

The Dormouse is called in Latin, Glis; and in Greek, Myones; the reason of the Latin name Glie, is taken from gliscere, which signifies to grow fat, according to the saying of Colonielle, very quibble fere owner reasoner shundare. Assure that by Paleie vero quibus fere omnes regiones abundant Asimus gliseis; that is to say, an As growth set by cating chasse which abounders in all Countries. This word Glie, signifieth not only a beat, but a piece of fat earth, and also a Thiftle; whereupon Sylvaticus made this verse:

Glis animal, glis terra tenase, glis lappa vocatur.

The Italians call it Lo Galero, Lo Gliero, or Giero; the Spaniards; Liron; the French likewife Linus, and Rat, Liron, and Ungloyer, and Ungratuel; the Germans, Eingreul; the Helverlans, Einred, or Rel mit, or for hallmans, Eingreul; the Helverlans, Einred, or Rel mit, or for hallmans, Eingreul; the Helverlans, Eingreul; or Rel mit, or for hallmans, Eingreul; the Helverlans, Eingreul; or Rel mit, or for hallmans, eingreul; the Helverlans, Eingreul; or for hallmans, eingreul; eingreul; or for hallmans, eingreul; eingr Gros beseimus; but our English, Dormouse, seemeth to be a compounded word of Deministration that is, a sleeping Moule. The Perministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a compounded word of Deministration of the seemeth to be a seeme that is, a fleeping Moufe. The Polonians call him Source. But concerning his name Myssel, the is some question among the Authors. For Saint Jerom writing upon the eleventh chapter of the

viticus, and the 66. Chapter of Blay, translateth Abber the Hebrer word for a Moule, Glirem, a Dormouse, and he giveth this reason, because all the Countries of the East, meaning Greeta, do fav. that Morm is a Dormonic, And this Morm by Epiphanim in his Anchorer is alleaded to prove the refurrection. Myoxus, faith he, Animal semestre moritur, & rursus post tempore suo revivisit. The Dormoule at half a year old dyeth, and after her full time reviveth again: And in his Book againft Herefien he speaketh thus to Origen; Tredunt natura terum experts, Myonum latitate, & fatur suo simul in The descripte codem los mullos parere; quinque, & ampline : Viperas autem bos venari, & fi invenerit totum latibulum on of the Dorible Vipera, quum non posset omnes devorare pro una vice ad sacietatem edit unum, que duos, reliquorum vero moule out of oculot expungit, & giber affert, excuatofque enutrit, donec voluerit unumquemqs corum devorate. Si vero con- Epiphanius. therit, ut aliqui inexperti in bos incidant, ipfosq; in cibum sumant, venenum fibi ipfis sumunt, cos qui à Vipera veneno, funt enutriti. Sic etigm o tu Origenes à Graca dollrina mente encavatur, venenum bie qui tibi crediderunt, evomuifti, & fattus es ipfis in edulium venenatum, ita ut per que ipfe injuria affettus es, per ea plus injuria afficerie.

The Philosophers which are cunning in the nature of things do write, that the Dormoule doth lie hid, and bring forth many young ones in the same place where he lyeth, five or more statime, and the Vipers, do hunt these to destroy them; now if the Viper finde their nest, because the cannot eat them all at one time at the first, ashe filleth her felf with one or two. and putterh out the eyes of the refidue, and afterwards bringeth them meat and nourish-th them, being blinde, until the time that her flomach fervall her to eat them every one. But if it happen that in the mean time, any man chance to light upon these Viper-nourishedblinde-Dormice, and to kill and eat them, they poyson themselves through the venom which the Viper hath left in them : so fareth it with the Origen, for thou art blinded with the Greciens doctrine, and dost vomit out that poyfon into their hearts which do believe thee, that thou art made unto them a venemous meat, whereby thou doft wrong others a as thou halt been wronged thy felf.

Py which it is manifelt, that Myorur is neither a Toad nor a Frog, but the Dormouse. And the charm which is made for the Affes urine; as we have thewed already in his flory, Gillar bibit. Or non meitt, Moreys meitt, or non bibit. The Cock drinketh; and Whether they maketh not water, the Dormouse maketh water, and never drinketh! But whether it be render urine true or no that the never drinketh. I dare not affirm 1 But this is certain, that the drink-ch but very seldom; and if one not affirm 2 But this is certain, that the drink-conies, as long as they can feed upon green herbs, do render abundance of urine, and yet

The Greciant also do call this Beast Elegos, although that word do likewise signific a Squirrel. In Mesia a Wood of Italy, there is never found Dormonse, except at the time of their littering.

They are higger in quantity then a Squirrel, the solour variable, sometimes black, sometimes grilled; lowestimes dyellow on the back, but stwayes a white belly; having a short colour, and is him, and a thinner skin then the Poppique Monse. They are also to be found in Helvetia, about Claype. It is a hiting; and an angry Beast, and therefore seldom taken alive. The beat or snow is long; the ears short and pricked; the tail short, and not very hairy at the end; the middle of the belly swelleth; down between the breast and the loins, which are more narrow, and scussed up together, they are always very far, and for that cause they are called Laditoni.

Buckman is very acceptable meat unto thom, and doth greatly fatten them, they are much de- Their food. lighted with Walnuts, they slimbe trees, and eat Apples, according to fome; but Alberton faith more truly, that they are more delighted with the juyge then with the Apple. For it hath been of-

2.1 [

tentimes found, that under Apple-trees, they have opened much fruit, and taken out of it nothing tentimes tound, cuatunder appreciates, that having gathered an Apple they prefettly put the kengels, for fuch is their wit and solley, that having gathered an Apple they prefet but the kengels, for fuch is their wit and solley, and so y sitting upon the uppermost bough prefit in the twist of a tree betwitt boughs, and so y sitting upon the uppermost bough prefit afunder. They also grow fat by this meens.

under: They also grow the by the wont to keep them in coops or tuns, and also in Gardens paled about No withers and no with board; where there are Beeches or Walnuttrees growing, and in Some places they have kinde of Durmic. of earther pot, wherein they put them with Walnuts, Buckmaft, and Chefinuts. And Authormore or earthen por, wherein they must be placed in tooms convenient for them to breed young it must be be observed, what they must be placed in tooms convenient for them to breed young ones; their water must be very thin, because they use not to drink much, and they also lovedry

Titus Pompeius (as Varro faith) did nourish a great many of them enclosed, and so also Hennis in his Park in Gallia. It is a Beaft well faid to be Animal Semiferum, a creature half wilde, for if you fet nis Park in Gama. It is a sport well min Warrens together, it is observed, that they never affemble, for them hutches, and nourish them in Warrens together, it is observed, that they never affemble, but such as are bred in those places : And if strangers come among them which are separated but such as are bled in them places. And a River, they descry them, and fight with them to

Society and charity iu them. Puny.

They nourish their parents in their old age, with singular piety. We have shewed already, how they are deftroyed by the Viper, and it is certain, that all Serpents lie in wait for them. Their old age doth end every Winter. They are exceeding fleepy, and therefore Martial faith:

Somniculosos illi porrigit glires.

They grow fat by sleeping, and therefore Aufonius hath an elegant verse;

Dic, ceffante cibo, fomno quis opimior eft ? glie .

Because it draweth the hinder-lege after it like a Hare, it is called Animal tratile, for it goth by jumps and little leaps. In the Winter time they are taken in deep ditches that are made in the Woods, covered over with small slicks, straw, and earth, which the Countreymen devise to take them when they are asleep. At other times they leap from tree to tree like Squirrels, and that they are killed with Arrows as they go from bough to bough, especially in hollow trees: for when the Hunters finde their haunt wherein they lodge, they stop the hole in the absence of the Dormoule, and watch her turn back again to the silly Beast finding there passingly blosed, is buffet hand and foot so open it for chreance, and in the mean season cometh the Hunter behinds her, and killeth tise. In Telling they are taken by this means . The Countrey men going into the fields, carry in their hands burning Torches in the fight time, which when the filly Beat perceiveth, with admiration thereof flocketh to the lights, wherebutto when they were come, they were for deazled with the brighteness that they were stark blinde, and might so be riken with many beauty.

Theule of the

take these

The use of them, being taken, was to eat their flesh, for in Rbetta at this day they saftit and est it, because it is sweet and sat like Swines flesh. Anniliana Marcellinia wondereth at the delicary of his age, because when they were at their Tables, they called for ballances to weigh their fifth, and the members of the Dormoule, which was nordone (faith he) without any diflike of fome prefent, the members of the Dormouse, which was not done (saith he) without any diffike of some present, and things not heretofore used, are now commended daily. Apining also prescribeth the music and things not heretofore used, are now commended daily. Apining also prescribeth the music and the feet of a Dormouse, beaten with Pepper. Nuckersels, Pavisnips, and Butter, stuffed all together into the belly of a Dormouse, and seved when the said and so baked in an Oven, or so din a Kettle, to be an excellent and delicate dish. And with thread, and so baked in an Oven, or so din a Kettle, to be an excellent awagnong the sin state at this day, they eat Dormice (slight Cassim;) yet there were ancient laws among the summit, sailed Leges consolie, whereby they were forbidden to ear Dormice, strange birds, they have been seen of the description of the Dormouse. The Medicines of the Desperation of the Negotian Wood of the State of

Pliny.

Dormide being taken in meat, do much profit against the Bushion. The power of Dormide miged with Cyl, doth heal those which are scaled with any hot siquot. A simple most doth presently take away all Warts being bound the reupon. Dormide and freeling being bound the reupon burnt; and their dust mingled with Hony, will profit those which desire the clearates of the reposition or field Mouse rubbed upon the eyes helpeth the aforesaid distant. A Dormous being first roasted and anointed with Oyl and Salt, being given in meat, is an excellent citie for hose that are short winded. The same allo doth very effectually heal those that foir out ship that are short winded. The same allo doth very effectually heal those that foir out ship must matter or corruption. Powder of Dormice of Red Mice; or young Worms, being the with Oyl doth heal those that have Kibes on their heels, or Chibbiains on their listed had been fat of a Hen, and the marrow of an Ox metted together, and her fat of a Bormoufe, the fat of a Hen, and the marrow of an Ox melted together, and hot

not infused into the Bars, doth very much profit both the pains and deafness thereof.

The fix of Dormlee being boiled, as also of field-mice, are delivered to be most profitable Seatur. for the excheming of the Palife: The fat of a Dormouse is also very excellent for those which are for the exheming of the Palife. The fat of a Dormouse is also very excellent for those which are troubled with a Palife, or shaking of the joints. The skins and inward part of a Dormouse being taken forth, and boiled with Hony in a new wesself, and afterwards poured into another vessel, will very effectually steal all diseases which are incident to the ease, being anointed thereupon. The skin of a Dormouse, or a Silkworm being pulled off, and the inward parts thereof being boiled in a new brasen vessel with Hony, from the quantity of twenty seven ounces, even to three, and so kept; that which there is need of a certain bathing vessel, the medicine being made warm and poured into the ears. The fat of a Dormouse is to middle as the strength of the asset of the storenamed diseases. The same is profitable for all pains, aches, or griefs in the belly. The urine of a Dormouse is an excellent remedy against the Passe. And thus much shall suffice concerning the medicinal vertices of the Bormouse.

> of the Hamster or Cricetus, the first figure taken by Michael Horus.

The fecond picture taken by John Kentmant, and it is her fashion and and procracture to lie thus when the is angry, for fo doth her colour appear both on the back and belly.

2.1223.7

This Beaft is called in Bunney Cricinist and in the Garman tongue Homester, Traner, and Thenames, ling in the earth of the roof of Corn, the is not drawn against her will out of her Cave at any time, but by requiring her will out of her Cave at any time, but by pouring hot water or fome other liquor. The head of ities of idivers to. The descriptive low, the back red, the best white and the hair stickesh so, soft to the skins, that it is dear on, first Best is we have said the hair stickesh so, soft to the skins. The is one on, little Best is we have said the part of the hair from the skins. It is one on sittle Best is we have said the part of the hair from the skins. It is one of the hair steely and full of courage, and there is one of the hair secreted from minute this original and desence, that it hath a bony helmet, downed have head and the hair when it standed in upon the hinder-legs : It resembleth both in colour and proportion. Bear. And for this cause some Writers have interpreted it

Marcellus.

Of the Norician Moule.

Or the Actto- to be the Beatt called Arttomys, thus described by Saint Jesom. It is a creature (latch he) abound. ing in the Regions of Palifina, dwelling always in the holes of Rocks and Caves of the earth not exceeding the quantity of a Hedgehog, and of a compounded fathion, betwirt a Moule and

But we have snewed already, that this is the Alpine Mouse, and therefore we will not stand to But we have inewed aireaus, that feems to be derived from the United word, which we read in confute it here. The name Criterius feems to be derived from the United word, which we read in Contute it nere. Ine name content faith he, is common in the Northern parts of the world, and Gelenius to be Skuzecziek: this Bear, later he, is common in the totalist parts of the world, and also in other places, in figure and shape it relemble the Bear, in quantity it never exceedes a great Sorex. It hath a short tail, almost like no tail, it goeth upon two legs, especially when its moved to wrath. It uses the fore-seet in stead of hands, and if it had as much strength, say hath courage, it would be as fierceful as any Bear. For this little Beast is not alraid to leap, into the Huntof the critisms of the critisms are the critisms of the critisms of the critisms. It is an argument that it is exceeding hot, because it is so bold and eager. In the uppermost chap it hath long and sharp exceeding not, because it is to bold and ge and wide cheeks, which they always fill, both carrying teeth, growing two by two. It hath large and wide cheeks, which they always fill, both carrying in, and carrying out, they eat with both, whereupon a devouring fellow, such a one as Sustimus a servant to Plausus was, is called Greetus, a Hamster, because he filleth his mouth well, and is no ping-

The making of his den.

r at his meat. The fore-feet are like a Moulds, to thort, but not altogether to broad, with them he diggeth the ler at his meat. earth, and maketh his holes to his den, but when he diggeth fo far as he cannot call the earth out of the hole with them, then he carryeth it forth in his mouth. His Den within he maketh large, to receive corn, and provision of fruit for his fustentation, whereinto he diggeth many holes, winding and turning every way, that so he may be sase both against Beasts that hunt him, and never be killed in his Den: And also if a mandig the earth, he may finde his lodging with more difficulty. In the harvest time he carryeth in grain of all forts, and my Author faith, Neque minus in alligende industrius, quamin eligendo, confervandoque est aflutus, optima enter reponit. He is no lefe industriousinthe gathering of his provision, then crafty and politick in the choife, and keeping it, for it lays up the belt ; and lest that it should rot under the earth, it biteth off the fibres and tail of the grain, laying

up the relidue amongst grafs and stubble.

It lies gaping over his gathered grain, even as the covetous man is described in the Satyre sleeping upon his mony bags. It groweth fat with replike Dormice, and Conies. The holes into the Cave are very narrow, to that with fliding out and in, they wear their hair. The each which cometh out of their holes doth not lie on heaps like Mole-hils, but is dispersed abroad, and that is fittest for the multitude of the holes, and all the holes and passages are covered with earth; but that hole which for the most part he goeth out at, is known by a foot path, and hath no hinderance in it, the other places at which the goeth out are more obscure and hid, and she goethout of them backwards. The male and female do both inhabit in one Cave, and their young ones being brought forth, they leave their out Den and feek them out fome new hishation. In the male there is this perfidier, that when they have prepared all their full finne, and brought it in he doth that out the female, and fufferett her not to approach night; who revenged his perfidiousness by deceit. For going into some adjoyning Cave, the doth likewise partake of the fruits which were laid up in store by some other secret hole in the Cave, the male never per-

So that nature hath wonderfully fore-feen the roverty of all creatures: neither is it otherwise amongst men, for that which they cannot do by equity, athey perform by fraud. This allo cometh in the speech of the common people, against one that will thrive. The young Country wenches concerning this matter, do chant out a verie not will start, which I am contented to express in lambicks, consisting of four feet;

Hame fer iple cum fulle Prudens catufq, confue, Stipat profinidum pintibus Per tempus antrum frugibus. Possique folus at frui, Lectio acervie bordet Avarus antro credulam Extrudit arte conjugem. Serva, inquit, exiens foras, Cæli ferena & pluvias. Sed faminie quie infliam.

away with both his feet that which relifteth him, directly invading his enemy : In the spirit and af- The anger and faulting of his mouth he is wayward and threatning, from whence our Country men were accustomed fury of this to fay of any one which was angry; he breatheth his wrath out of his mouth like a Hamfter: Du beaft. fruest vuie ein Hamster: neither is he easily affrighted, although he be far unequal unto those in

Brength with whom he is in combate.

wherefore some do give it in the place of a Proverb, that our Countrymen do call a man which is madly rash, Eintollen Hamfler, as fool-bardy as a Hamfler. He flieth from any one that doth sharply refift him, and doth greedily follow after them that flie from him. I my felf faw one of thele, who he affaulting a Horse gat him by the nose, and would never leave his hold until he was killed with a fword: He is taken by divers means, for he is expelled either by hot water poured into his den, or Of the taking is choaked within; or being digged up with a mattock or spade he is killed; or by Dogs. He is some of this bealt. times pulled out by the Fox, or hurt: or oppressed by some snare, a great weight being put about it : or to conclude, he is taken by Artalive, and that in the night time, when he goeth to feek his prey,

for in the day time for the most part he lyeth hid.

Before hisusual Cave (as I have said) he is taken by the path which is worn, by a pot which is put into the earth, and afterward made plain about it like other places of the field; there is earth call into the bottom of the pot to the deepness of two fingers, above every where covering the pot there is placed a stone, which is held up by a piece of wood, to which there is bound below a fragment of bread: In the space between the Cave and the pot there are crums of bread scattered, which he following and leaning into the pot, the wood falling, he is taken. Being taken after the manner of other beafts, he toucheth no food. If a broad stone, such an one with which they cover pavements, or of which they make roof tiles, fiall be joyned unto the pot, and the beaft be taken, he will be very hardly known in the morning; for the spirit of the peaft being shut in, and waxing wroth, piercing for thinness doth moisten the stone. The skins of Hamsters are very durable, of which there are certainlong coats which come down unto the heels, and divers coloured cloaks made, which the women of Miferia and Silefia do use, and account them very honorable, of a black and red colour, with broad guards our diges of the skins of Otters: the same coats are for the most part valued at the price of fifteen or twenty Renenfian crowns: for it doth out-wear in tength three or four garments made either of linnen or woollen cloath.

In Turingia and Misena this beast is frequent, notwithstanding not in all places, for in Turingia his chiesest abode is about Efurdanne, and Salcenfis in Misena, about Lipsia, and the field Pegensis, the plentifulleft and most fertilest places of both those Regions. In Lulatia about Radeburge, he is diggelout of those places where Painick groweth. At Mulberge and Albis, he is found in the Vineyards, for he is also fed with ripe Grapes. Our Country men are wont to burn a living Hamster in a pot, being shut, for the medicines of Horses. It hath been seen that one of these hath seaped up and caught a Horse by the nose, never letting go his hold until she was cut off with a sword. The skin is of three or four different colours, besides the spotted sides, and therefore the skin is very pretious. They abound in Turingia where the foil is good, and there is also great store

Of the NORICIAN MOUSE.

The Norleian Mouse is called in Latine, Citellus, and it keepeth like the wilde Mice in the caves The name, deand dens of the earth. The body is like to a domestical Weefils, long and stender, the tail fertiption, and very short, the colour of the hair like to a gray Conies, but more bright. It wanteth ears like a disposition. Mole, but it hath open passages in stead of ears, wherewithal it heareth the sound, as you shall serious the same that the sound, as you shall serious the same that the sound is serious that the same that fee in many birds. The teeth are like the teeth of Mice, and of their skins (although they be not very precious) they use to make garments. In Germany they callit Pile and Zifel, and of this Gervery precious) they use to make garments. In Germany they call it Pile and Zisel, and of this German word was the Latine Citellus seigned; and it appeareth by Igricola, that there are two kindes of these, one greater, which are call'd Zysell and Zesseile, and another lesser (called Pile) which may Genelius, be the same that is also casted Richmus, and differeth from other, because it is used for meat. These are bred in Croating, and in the Good try about Venice. They have a strange smell or savour, which is said to be hurtful to the head. They eat both saited and hung in the smook, and also fresh and new killed. With their skins they edge the skirts of garments, for it is as soft as the skin of a Hare; and beside the common nature of they are saided. They also have very large cheeks, whereinto they gather an innumerable quantity of grain, and carry it into their den, as it were in bags against the Winter. They live thirty out they together in a Cave, and are not driven forth but by insussing seight and seek.

Of the MOUSE PONTIQUE.

"He name of this Moufe is given unto it from the Mand out of which it was first brought, Olaus mag. I named Pomus, and for this cause it is also called Venetus, because it was first of all brought into Agricola. Germany from Venice. It is called also Varius by Idorus, from whence cometh the German

The History of Four-footed Beasts.

word Vutick, from the diversity of the colour Gran unerck. It is called also Pundimus, as it were word vuick, from the diversity of the coule they were wont to be brought in bundles to be fold fifty Pontious min, of Lattice of Dolla for twenty groats, Volaterranus, and Hermalam are of this opinion, that together, and they were loud for twenty givens, Armeline, and the Germans, Hermelin, but we the white one in this kinde, be called of the Italians, Armeline, and the Germans, Hermelin, but we have promifed already to prove that Hermelin is a kinde of Weefil, which in the Winter time is white. have promined an easy to prove sind in the Summer returneth into her colour again, like as do the by reason of the Alper. This Pontique Mouse differeth from others only in colour, for the white is theres or the super. I have a super the super su mingled with air colour, or che it is lainly and black, and in colours at this day they are found red and ash coloured. Their two lowermost teeth before are very long, and when it goeth, it driveth and ash coloured. When it eates it uses the fore-feet in stead of hands, and stedeth upon the tail after it like Mice; when it eates it uses the fore-feet in stead of hands, and stedeth upon the tail after it like Mice; when it eates it uses and such that stellar it is the asset of the steady the tan anet in the Winter time they Walnuts, Chefnuts, Filbeards, small Nuts, Apples, and such like fruits. In the Winter time they Wainuts, Chemides, And it is to be remembred, that the Polonians have four kindes of presitake neep in Meas of mice which they use in their garments, distinguished by four several names. The first our skins of Mice which they use in their garments, distinguished by four several names. The first ous skins of white Beaft all over, exem of grifel colour, called Popieliza. The fecond is called Gronofiball, a very white Beaft all over, exem the tip of the tail which is all black, and this is the Hermelin.

The third is called Novogrodela, from the name of a Town, and this is white mingled with grife, and this is also a kinde of Pontique Mouse. The fourth Dvieworks, of a bright Chesnyt colour, and this is the Squirrel, for they call Squirrels, Weefils, and Hermelins all by the name of Mice. These Pontines of the Pontique of Mice. tique Mice have teeth on both fides, and chew the cud. In the Winter time as we have faid they lie and fleep, especially the white ones, and their sense of taste doth excel all other, (as Pliny writeth) they build their nelts and breed like common Squirrels.

Their skins are fold by ten together, the two best are called Litzschna; the third, a littlework, are called Crafna, and the fourth next to them Pocrafna, and the last and vilest of all Mobilions with these skins they hem and edge garments; and in some places they make Canonical garments them for Priests, unto which they sew their tails to hang down on the skirts of their garments; of which cultom Hermolaus writeth very excellently in thele words. Infruett, o exmuritim ham ham vita alios magnie frigoribus, alios medio anni tempore, a feptentrionibus petendo, armamus corpeta, & divilemus animos. That is to fay, The life of man hath learned to be prodigal, even out of the skint of Mice, for some they use against extremity of cold, and they feech others out of the farthest Northern parts, for the middle part of the year: Thus do we arm and adorn our bodies, but put down and spoil our mindes.

Beside, there is a flying Pontique or Scythian Mouse, which we may call the broad Squirrel Moufe whose skin is here expressed as you may see, and for the description thereof, I have thought good to add an Epiftle of Antonius Schnebergerus the Limanian of Vilna unto Gefner, in thefe words

I fend unto thee a little skin, the upper place of the hairs thereof being of a white ash colour; but the root of the hair or inner part thereof is a black brown. They call it Popyelycza Lataacza, that is, a Pontique flying Mouse: It is always so moift, that it can never be dreffed by the Skinner, or Lether-dreffer.

ving a perswasion that there is in it a singular vertue for the easing and mitigating of those pains but I think that the softeness was the first cause which brought in the first use thereof, but if the hairs do not cleave hard to the skin is carned by the state of the skin is carned by hairs do not cleave hard to the skin, it cannot be done without danger. Also the hairs banging as it were in a round circle against or above the two former feet, they call wings, wherewithal the

Of the Shrew-moule.

are thought to flie from tree to tree. Thus far Amonius. Gefner after the receit of these skins, being willing to preferve them from moths, because they were raw, for experience fake gave them to a leather dreffer, who presently dreffed them with Vinegar, and the Lees of Wine, so that it appeareth the Skinners of Lituenta had not the skill how to drefs it.

After they were dreffed they were fo fore, that they stretched above measure, fo that every one of them were square, that is to say, their length and breadth were equal, for they were two palms or them were iquare, that is to say, their length and preauth were equal, for they were two paims or eight fingers broad: and no more in length, the head and tail excepted? wherefore it may well be called a fquare Moule, or Behind quadratus, because we are fure of the former, but not of the flying the tail was as long as four or five fingers are broad, being rough like the tail of other Squirrels, but befet with black and white hairs, the whole colour both of the belly and upper part was white but belet with Duck and white that, the whole colour both of the peny and upper part was whitiful, as we have faid, but black underneath? the hair is so soft as any filk, and therefore fit for the also the eyes. The ears morter and rounder them a Squirrels, the feet did not appear by the skin the neather part was diffinguished from the upper part, by a certain visible line, wherein did hang certain long hairs, which by their roughness and follidity under the thin and broad frame of their body. might much help them to fleseven as broad fifthes fwim by the breadth of their bodies, rather then by the helpof their fins. The Helvetians wear these skins in their garments. It is reported by Alianns, that the Inhabitants of Pontus, by making supplication to their Gods, did avert and turn away therage of Mice from their Corn-fields, as the Egyptians did, as we have faid before in the story of the vulgar Moule. A signodal and A sold

eet 10 stated strateds sold adds. The notinogous officiers Ofithe Monfe called the Shrew, or the Erd fbrew.

The word Honeke of the Hibrens remembred in the 11. chapter of Leviticus, is diverily interacting beaft; some Alorfo-leach, or bloud flicker; some a Hedgehog; and some a Beaver, as we have heaved before in the Hedgehog but the Septiagints translate it Mygde, and S. Jerom, Mils aramus, that is, a Shrew. Dissorters calleth it Mogale; the Germans and Helvetians; call it Mutter; intome parts of Germans; from the figure of the snowt it is called Spitzmus; by some Dissorters in the stone of the voice; and some Oris Dissorters is the stone of the Mulle, because it resembleth mys, that is, a Musk-monite) because it being dryed in a surrace since like thick Musk. The skin pulled from the slesh, since leth be the since of the stone of the surrace of the slesh myst. The skin pulled from the slesh, since leth be skin pulled from the slesh, since leth be skin pulled from the slesh, since leth be skin pulled from the slesh, some constant to the slesh myst. The skin pulled from the slesh, since leth show the slesh myst. The skin pulled from the slesh, show the slesh myst. The slesh show the slesh show the slesh show the slesh shows the slesh show the slesh s sembleth a Weefil, and therefore it is compounded of two words, My, a Mouse, and Galee,

Ampha is of opinion, that it is so called, because it is begot betwirt a Mouse and a Weefil, but this is neither true nor probable. For is it likely that Weefils and Mice will couple together in arial cofullition, whose narties are so contrary, the one living upon the death of another, that is the Weelli upon the Moule? And beside the difference of quantity betwiat them, maketh it impossible to have such a generation. The other derivation of Mygale, which is made by Rodolphus writing upon Leviticus, secching Mygale from Musquights, that is, a devouring Monse, six is against the order of all good Linguist's to derive Greek Words from Latine, but rather consonant to learning, to settling I will be a supposed to the second s feich the Latine from the Greek,

There is no less inquiry about the Latine name, why it stiruld be called Mus araneus, seeing same significal a Spider. This Mouse saite Albertus, is a red kinde of Mouse having a small fail, a sharp voice, and is full or poylon, or venom: For which cause Cats do kill them, but do not them. Spontings we like this, of this Shrew, Mus araneus, exquent animal, any levisticant, but distance mode tensissimum films, or gladit actum conformats. That is to say, this Shrew mouse is a little and light crashing which like a Spider climeth un mount any small thread, or no moule is allitele and light creature, which like a Spider climeth up upon any small thread, or upon the edge of a sword; and therefore you see, they derive the Latine name from his climing like

But in my opinion it is more reasonable, to derive it from the venom and poyson which it containeth in it like a Spider. For which cause Silvations writern thus; Magelt id eft, dracs mari-

Samonicus.

Vegetius.

Aetius.

nus, & animal venenosum, pusillum muri simile: nam & araneum piscem, propter venenum pungentibus insum spinid, veteres ophim, id est, serpentem nominarum, & bodie quam vulgo dracenem vel dracenam. That is to say: There is a sist of the Sea, and a little Beast on the Earth like a Mouse, which by a general word fay; I here is a min or the Dea, and a nicle bear on the paragon, or Dragonist, was in ancient time are called Mugale, and the Spider-fish called at this day a Dragon, or Dragonist, was in ancient time called a Serpent, because by his prickly fins, he did poyson those which were strucken by him. And concerning the description of this beast, it may be taken from the words of an ancient English Physi-

tian, called Doctor William Turner.

I have seen (saith ite) in England, the Shrew-mouse of colour black, having a tail very short, and her snowe very long and sharp, and from the venemous biting of this Beast, we have an English Proverb or Imprecation. I bestrow thes, when we carfe or wish harm unto any man, that is that fome such evil as the biging of this Mouse may come auto him. The Spaniards call this Beast Rates Pequenno; the Illyians, Vienced kamps; and the Polonians, Kerit. They were wont to abound in Britans.

Hermiolaus writeth. They are also plenkiful in Italy beyond the Mountains. Apennine, but not on this fide (as Pliny writery are also plenkiful in Italy beyond the Mountains. teth) yet in the hither parts of light and Germany, there are many found, especially in the Country neer Treat, in the Valley Anania, where this is admirable, that by reason of the coldness of that Country their bitings are not venemous. For the Scorpions there are not venemous, although in other places of Italy they poyfon deeply. This Beaft is much les then a Weefil, and of an ash colour, in most places like a Mouse, although the colour be notal-

The eyes are fo small, and beneath the proportion of her body, that it hath not been unjustly doubted of the Ancients, whether they were blinde or no, but in their heft eftate their fight is very dull. And for this cause the ancient Egyptians did worship it : for as they held opinion, that darkness was before light, so they deemed that the blinde creatures were better then the seeing. And they also believed, that in the wane of the Moon the liver of this beast consumed. It hath a long and sharp snowt likes Mole, that so it may be apt to dig. The teeth are very small, but so as they stand double in their mouth, for they have four rows of teeth, two beneath, and two above, which are not only apparent by their diffection or Anatomy, but also, by their bitings, for their wounds are Quadruple, wherefoever they fasten their teeth. Their tail is slender and short. But the description of this Beast was better apprehended by Gester, at the fight of one of them, which he relateth on this manner:

The colour (faith he) was partly red, and partly vellow, mingled both together, but the belly white. The hinder-feet feemeth to cleave to the body or loins. It smelleth strongly, and the savour did bewray or fignifie some secret poyson. The tail about three fingers long, beset with little short hairs. The residue of the body was three singers long. The eyes very small and black; not much greater then Moles, so that next to the Mole they may justly be called, the least signed creame among all four-footed Beafts; fo that in old age they are utterly blinde by the Providence of God, abridging their malice, that when their teeth are grown to be most sharp, and they most full of

poylon, then they should not see whom nor where to vent it.

They differ as we have faid in place and number, from all four-footed Beafts, fo that they feem to be compounded and framed of the teeth of Serpents and Mice. The two fore-teeth are very long, and they do not grow fingle as in vulgar Mice; but have within them two other small and sharp teeth, And also those two long teeth grow not by themselves, as they do in other Mice, but are conjoyned in the residue, in one continued rank. They are sharp like a law, having sharp points like needles, such as could not be feen by man, except the tips of them were yellow. Of either fidethey have eight teeth, whereas the vulgar Mice have but four, beside the two long fore-teeth, which also seem divided into two or three, which except one mark diligently, he would think them to be all one.

Arnoldus.

Æltanus.

It is a ravening Beast, feigning it self gentle and tame, but being touched, it biteth deep, and poyfoneth deadly. It beareth a cruel minde, desiring to hurt any thing, neither is there any creacure that it loveth, or it loveth him, because it is feared of all. The Cats, as we have said; do hunt it and kill it, but they eat not them, for if they do, they confume away in time. They annoy Vines, and are feldom taken, except in cold!" they frequent Ox-dung, and in the Winter time tepair to houses, gardens, and stables, where they are taken and killed.

If they fall into a Cart-road, they die and cannot get forth again, as Marcellus, Nameler, and Pliny affirm. And the reason is given by Philes, for being in the same, it is so amazed, and trembleth, asif it were in bands. And for this cause some of the Ancients have prescribed the earth of a Catty road, to be laid to the biting of this Moufe for a remedy thereof. They go very flowly, they are fraudulent, and take their prey by deceit. Many times they gnaw the Oxes hoots in the habit They love the rotten flesh of Ravens; and therefore in France, when they have killed a Raven, they keep it till it ftinketh, and then caft it in the places where the Shrew-mice haunt, whereunto they gather in so great number, that you may kill them with shovels. The Egyptians upon the former opinion of holiness, do bury them when they die. And thus much for the description of the showless arising out of this Beast; also the cure of her year mous hitings. mous bitings.

Tot

The Medicines of the Shrew.

The Shrew, which falling by chance into a Cart-rode or track, doth die upon the fame, being Marcellus. burned, and afterwards beaten or dissolved into dust, and mingled with Goose grease, being rubbed or anointed upon those which are troubled with the (welling in the fundament coming by the cause of fome inflammation, doth bring unto them a wonderful and most admirable cure and remedy. The of tome than the control of the cont doth help those which are grieved and pained in their bodies, with sores called fellons, or biles. which doth pain them with a great inflammation, fo that it be three times invironed or compaffed shout the party so troubled. The Shrew which dyeth in the furrow of a Cart-wheel, being found Pling. and rowled in Potters clay or a linnen cloth, or in Crimfon, or Scarlet woollen cloth, and three times marked about the Impostumes, which will suddenly swell in any mans body, will very speedily and effectually help and cure the fame.

The tail of a Shrew being cut off and burned, and afterwards beaten into dust, and applyed or anointed upon the fore of any man, which came by the biting of a greedy and ravenous Dog, will in very short space make them both whole and found, so that the tail be cut from the Shrew when the is alive, not when the is dead, for then it hath neither good operation, nor efficacy in it. The former hoofs of a Horse being scraped, and the same fragments or scantlings thereof being beaten Hippocraies. in the dust or earth, which hath been digged up by a Shrew, in four measures of water, poured down the mouth of a Horse which is troubled with any pain or wringing in his bowels, will soon give him both help and remedy. The Shrew being either applyed in drink, or put in the manner and form of a plaister, or hanged upon the fore which he hath bitten, is the most excellentest, and and form of a planter, or manged upon the role which he hate noticen, is the most excellentest, and most nedicinable cure for the fielping and healing thereof. A prefervative against poyson, would be an excellent remedy, that neither man not any other living creature, should be bitten if they should leave or would want that superstition called an enchantment against poyson, being hanged about the neck, whereof we will speak more in the curing of the bites of this Beast.

ata ta 177 mga meti**k** delambada ge**a** 177 That the biting of a Shrew is venezione, and of the reason of bealing in this kinds.

la list the biting of a Shrew is accounted for a very strong poyfon, and that except there be Pliny. some medicine very speedily applyed for the curing and healing thereof, the party so bitten will de. These Shrews are truly so venemous and full of poyson, that being slain or killed by Cats, whose nature is to kill what soever Mice they take, they will not offer to touch or eat the least part

But the biting of a female Shrew is most obnoxious and hurtful when the is great with young, but Marcelles.

moldangerous of all when the biteth any one which is great with young, either a woman or any other Beat what foever, her felf being allo with young, for then it will hardly be cured.

If a shrew thall bite any creature while the is great with young, the puthes or bites will in time be Dioscorides. The which they make and will come unto a very great and malignant wound and fore. If the Shrew that here we have a shrew that here we have the shrew that he do also bite any creature during the time she is with young, she will presently leap off, notwith-standing shebiteth more dangerous. There is nothing which do more apparently explain and shew the biting of a Shrew then a certain vehicinest pain and grief in the creature which is so bitten, as also a pricing over the whole body; will an inflammation or burning heat going round about the place, and a flery redness therein, in which a black push or like swelling with a watery matter, and silly to truption do the arise, and all the parts of the body which do joyn unto it seem black and blew with the marvestow great pain, anguish, and grief, which ariseth and proceedeth from the same.

When the push or bile which cometh by the occasion of a Shrew cleaveth or is broken, there prowhen the push or bile which cometh by the occasion of a Shrew cleaveth or is broken, there prowedeth and issued for the aking of white fless, having a certain rinde, oy skin upon it, and sometime there appeared in the first order in the same is catterin and falleth out,
but in the beginning there is a most viiting green corruption and matter which showeth in the
same, afterward is is put resided, and eaten he and then the stell falleth torth, the wringings also of Dioscorides.

Company the same.

But Autorina affirmeth, that in what place to ever this Beart thall bite, the fores, thereof, with great angular will pant or bear; and that in every hole wherein his venemous teeth have entred, there will certain fiesty sedness appear; the skin whereof being broken, there will come a very white and maniferfore, which will breed much pail and trouble in all the parts of the body for the marks part. The fores or wounds which are middeulfolds this freatt are very manifeltly known by the marks of the foresteeth fanding all in a row together, as also by the blood which iffigeth from the wound, being at the first pure, clear, and exceeding that but afterwards corrupt, blackish, and full of gitter.

There do also the state of the

There do also divers bunches write in the fieth usually after the biting of this Beaft, which it any man shall break, he shall see the flesh which lyeth under them corrupted, and divided with

Actim.

The History of Four-forced Beasts. certain clefts or rifts in the fame. Moreover the nature of this Beaft is fuch, that for the most part he doth covet to bite those whom he can come unto by the stones or genital, not only men, part he doth covet to bite those whom he can thus much shall suffice concerning the biting of but also all other brute Beasts whatsoever: and thus much shall suffice concerning the biting of

ns Beau. Wormwood being beaten or bruifed small, strained in a fine sinnen cloth, and mingled in Wine. this Beaft. given to the party, either man or woman, in Wine to drink, who is bitten by a Shrew, will procure Diefer ides. him present case and remedy. The same also is an excellent remedy for the bitings or shingings of

him present case and remedy. The same hand of Dogs, as also for the bitings of the Shrew, and of Dogs, as also for a Sen-dragon. Vinegar is very medicinable for the bitings of the Shrew, and of Dogs, as also for a Sen-dragon. Vinegat is Scolopeudra, (which voideth all her bowels out until the hook come the fish called by the Latiner, Scolopeudra, (which voideth all her bowels out until the hook come forth, wherewith the is taken, and then sucketh them up again) the Scorpion and all other venom-

is Serpents.

But the Greetan Physicians affirm, that the same ought to be mingled with other medicines. But the Gracian Physicians annual, the same as to take the after of the Shrew being burnt, the gum or liquor of the Herb called Fennil-giant, dryed Barly beaten into small powder, Mugum or ilquor of the Herb called Purple, or Mothmullein, and mingle them stard-feed pounded iman with the rief cancer rutple, or satestimenent, and mingle them all together with Vinegar, and being so applyed they will presently cure the aforesaid sings

ortings.
Garlick being bruised, and the juyce thereof anointed upon the place which was bittenbya Shrew, will presently expel the pain, and wholly cure the fore. For the expelling of the faperfluities of the parings of the dead flesh, growing round about the fore, being not call away but remaining thereon. Take Cummin and cover the wound or biting therewith, then apply Garbut remaining thereon. And anoint the places about the fore, as allo the fore it felf very diligently, and in very short space of time it will cause the same to fall away of it own accord. very amgentry, and in the sites of this Beaft: Take Garlick, the leaves of a Fig. tree, and Cummin, mingle them very well all together, till they come to a mollifying or temperate substance; then take Dioscorides. the fame, and fashion it in the form or manner of a plaister, and it will very speedily and effectually

The feed or leaves of Coleworts, being beaten together with Vinegar, and the herb call'd Affa fe ida, is very good and profitable to be applyed either to the bites of this Beaft, or a ravening Dog. The dung of a Dog being taken and anointed upon either Man or Horse which hath been bitten by a Shrew, will be an excellent remedy both for the curing and healing them of the same. The hoof of a Ram being dryed, beaten into powder & afterwards mixed with Hony, will be likewise very good for those which are bitten with the same Beatt, so that they be first tempered and sashioned in the manner of a plaister, and then applyed thereunto. The little white stalks which proceed from a black Fig. being beaten with the leaves of the herb called Moth-mullein, Wax, and Vinegar, until they comeunto a mollifying Juyce or falve, will be an excellent remedy against the biting of the Shrew,

The young or tender stalks of a wilde Fig-tree, be they never so few or small, being sind steeped in Wine, then sapped in a leaf of the same Tree, and so applyed unto the sings and bites of Scorpions, and the Shrew, will in very short time cure and heal the same. Provided always being anointed thereupon. that the wound be well and diligently bathed or washed, before any thing be put or applyed

Dieferidet, Avicenna, and Attuara, do affirm, that the excellenteft, and medicinableft cure for the bites of a Shrew is this : To take the Spleen of the lame Beaft, and beat it together with Vineger, and the Gum called Galbanum, then to anoint it or rub it upon the fore, and it will prefently expel away all pain, and in some short space altogether heal it. If the red bunches or ulcers which do usually grow about the bites of a Shrew, do fortune to break; take very tharp and strong bine or pickle, and tub it both about, and within the sore, and atterwards apply. Barly being burged and beaten into small dust or powder thereunto, which medicine although it seem somewhat grievous and painful, yet it is very good and profitable for the expelling either of the stings of Scorpons, or

and paintin, yet it is very good and projector the experimend entire of the lines of the Shrew or ravenous Dog.

The genital of a Hare being beaten into powder mingled with Vinegan, and anointed upon the bites of a Shrew, doth specially cure them. Wilde Mallows being mingled with those Millows that grow in the Garden, have in them a very effectual force and power to cure all stings or veromous bitings, especially of Scorplons, Shrews, Walps, and such like stinging creatures.

The Shrew being cut and applyed in the manner of a plainter, doth effectually cure bet own bites The Shrew being killed and anointed all over with Oyl, and dirt or mire, applyed unto the Ulcen or red swellings which come by her venomous teeth, will very speedily procure themsoibreak. The Shrew being cut or beaten into small pieces, dryed into powder, mixed with Vinegar, and fashioned in the fashioned and the state of the state o

in the form of a plaister, will very speedily and effectually cure the bites of a Shrew, whether she be great with young or not, so that they be well applyed, that gunto.

But there are some which do think it, nothing convenient to mingle the Shrew with any other thing what soever, but that it is only after this manner to be applyed by it felf, as to take the burned or dry it, and then to pound it is pounder, and see Sprinklein a burned or dry it, and then to pound it is pounder, and see Sprinklein a burned or fore, which burned or dry it, and then to pound it in powder, and to to fprinkle it in the wound or fore, which in very short time will easily heal it. The Shrew falling into the formow of a Cart wheeldoth presently die: the dust thereof in the passage by which she went, being taken and sprinkled into the wounds which were made by her poylonsome teeth, is a very excellent and present remedy for the

the curing of the lame. Martheolus alleadgeth out of Nicanders, that the dirt which cleavath Actim, into the wheels of a Charior being feraped off and frainkled into the bices of a Shrow, will be very medicinable for the healing of them, which thing he himself thinkerh a meer fable, and not to be believed. If the pimples or bladders which arise in the bites of a Shrew shall be thought convenient to be broken, for the performing of the same, take the skin of a baked be thought from granace, and spread it upon the storeland red pumples, as hor as possible may be suffered for some small time, and it will cause the ulcers to break, and all the corruption to

ifue forth.

If it grow unto an Impostume, take the little herries or pellets which are within the Pomgra- Avicents. A Moul being bruiled incompany them and the fore fome thore time, and they will vary eafily our the lame. Multard-feed being mingled with Vinegar, anointed upon the bites of a Shrow, Aegineta. doth very effectually heal them. A Moul being bruiled into small pieces, and applyed unto the bits of a Shrew in the form of a plaister, is a very excellent remedy for the curing of them. Picch and Trifoly being baked, and rubbed very hor upon the bites of a Shraw, is accounsed a very me-dichable cure: but it is requisite that this formentation be given onto none but such as are of a frong and powerful body, and are also able to endure pain. The liquor of the Herb called Southern- Diescorides. wood being given in Wine to drink doth very much profit those which are troubled, and pained in ther limbs with the bites of Shraws. Wormwood being used in the like manner, will cure those

which are bitten by a Shrew. Tell being mingled with four drams of the Herb called Ariffolichia, or the genital of a Lamb or Kid being mingled with four drams of the Herb called Ariffolichia, or that work, and the drams of the fweetest Myrth, is very good and needicinable for curing of those which are bitten or thing with Shrews, Scorpions and such like workenous Beatle. The leaves of Colewhich are bitten or thing with Shrews, Scorpions and such like workenous Beatle. The leaves of Colewhich are bitten or things with Shrews, Scorpions and such like workenous Beatle. The leaves of Colewhich are bitten or things with Shrews, Scorpions and such like workenous Beatle. which are pitted by April with a sprayes provided many and transcriptions of a colle-works being dryed, mingled with flower, and tempered together, until they rome into the form of plainter, wilkyery much help against the venemous bites of the Shrew: The feeds of Coleworts, Ruelling, and the leaves of the fame herb being mingled with Vinegar, and the herb called all failed beat or pounded together, do very well and speedily care the bites of the Shrews, as also of a ravenous Dog; i the lame in due time be applyed thereunto. The liquor allo of the leaves of Coleworts being eveninany kinde of drink, is good and wholefome for the cuting of the aforefaid bites or wounds. the Nuts of a young Cypres tree being mixed with a certain fyrup or potion made of Hony, Water, Diescorides. ind Vinegar, and atterwards drunk, doth very speedily procure safe and help for those which are

The root of a white or black Thiftle, being bearen or bruifed and given in drink, dorn very effective the por cure those which are bitten by a Shrew. The like vertue hath the herb called Rottinit, and also the feed the roof being given in any kinde of drink. The gum or liquor which promoteth from a kinde of Ferula, being given in Wine to drink, doth very much help and sure Eginetta. those which are hitten by a Shrew. The same vertue also in it hath the root of the herb called Gentinot litterwort, being given in Wine to drink. One or two drams of the youngest or tendrest leaves of the Laurel treas, being beaten small and given in Wine to drink; doth speedily oure the force or wonds which are hitten by a Shrew: the same being also used in the said manner, and given in some Asius. partin portion unto Horfes to drink, doth quickly help and heal them. But there are some which before all other medicines do commend this for the belt, and chiefelt; that is ; to take the juyce Avicenna, which proceedeth from the leaves of the Lawrel tree, and the leaves themfolies; being moist and and processes from the seaves of the hawrestere, and the travers members is being members and to boil them in Wine, and being once cooled, to give it to any which is bitted by a Shrew, and ship will in very thort space; altogether help them in A young Weefil being given plans which, is accounted wark medicinable for those which are bitten by a Shrew, or thung by iscorping or any other, venerages greature. The herb called Baltamint, or Costmary, the herb called Baltamint or Costmary, the herb called Baltamint or Costmary and Eginetic. Scorpion of any other vanemous executes. The herb called Baltianian or Costmary, the herb called Battam, or wide Pallito, the herb called Bosony, the herb called Water-mint, or Water and Battam, or wide Pallito, the herb called Bosony, the herb called Water-mint, or Water and Battam, or wide pallito, or applyed in the manner of a plainfer of the first of the wide provided in the manner of a plainfer of the first or wounds which come by the venemous teach of a Shrew, will very effectionally care the paint of a field Mouse or Shrew, it wary troubletome or griddons to all labouring Beatis, for instantly after her bitings there do little red Pipples arise; and there is not done of death in their pasts which the bitesh when their great with young! for the shrew dothalls kill long labouring Beatis which the bitesh when their great with young! for the shrew dothalls kill long labouring Beatis with poysas, as chiefly Horses and fullers; burief pacially and forthe most part Mares, which are great with young. There are some which do affirm, there if Horse, or any other labouring creature do seed in that pasture or grass in which a Shrew shall but forther wenome or poyson in, they will presently die. In what place soever a Shrew shall bite in forthler venome or poyfon in, they will presently die. In what place soever a Shrew shall bite in Abstrus. any creature, it will be compassed with an exceeding hard Iwelling, the Beast also being so bitten, doth expects his grief or forrow with much pain, and straining his body doth likewife swell all over, ters do not proceed by the first that the state of the st

By if the show do bice any beat when the is great with young, it is known by these fighes of make, there will certain and pumples compast the foreround about, and also becad themselves out all the body of the bitten Beat, and will inchose space defroy him, except there by procured

The Medicines of the Shrew.

nus & animal venenosum, pufillum muri simile : nam & araneum piscem, propter venenum pungentibus infinum hus, & animal venerajana, pajulari man judite man, & bodie quam vulgo dracenem vel dracenem. That is to fay; There is a fifth of the Sea, and a little Beaft on the Earth like a Mouse, which by a general word lay; I nere is a min or the Sea, and a nicle beat on the Apagon, or Dragonift, was in ancient time are called Mugele, and the Spider-fifth called arthis day a Dragon, or Dragonift, was in ancient time are called Mugate, and the Spider-nin called a time way a straight, or straight, was in ancient time called a Serpent, because by his prickly, fins, he did poylon those which were strucken by him. And concerning the description of this beast, it may be taken from the words of an ancient English Physic

tian, called Doctor William Turner.

I have seen (saith he) in England, the Shrew-moule of colour black, having a tail very short, and her shows very long and sharp, and from the venemous biting of this Beast, we have an English Provers or Imprecation. I bestrow thee, when we care or wish harm unto any man, that is, that frovering or imprecations, I betting which may come unto him. The Spaniards call this Beaft Rates from fuch evil as the biging of this Moule may come unto him. The Spaniards call this Beaft Rates frequents; the Illyians, Viewed kamps; and the Polonians, Kerit. They were wont to abound in Britany.

Hermolaw writeth.

They are also plentiful in Italy beyond the Mountains Apennine, but not on this fide (at Pliny wri-They are also prentiful in tray peyond the mountains, openants, out not of this ride (as Plinywriteth) yet in the latther parts of Italy and Germany, there are many, found, especially in the Country neer Trent, in the Valley Anania, where this is admirable, that by reasons there coldness of that Country their bitings are not venemous. For the Scorpions there are not venemous, although in other places of Italy they poyson deeply. This Beaft is much less then werening, and of an aft colour, in most places like a Mouse, although the colour be not al-

ways commune.

The eyes are so small, and beneath the proportion of her body, that it hath not been unjustly doubted of the Ancients, whether they were blinde or no, but in their light estate their sight is very dull. And for this caule the ancient Egyptian did worship it : for as they held opinion, that darkness was before light, so they deemed that the blinde creatures were better then the seeing. And they also believed, that in the want of the Moon the liver of this beaft confirmed. It hath a And they also believed, that in the wane or the Moon the liver of this bear conjumed. It hath a long and sharp showt likes Mole, that so it may be apt to dig. The teeth are very small, but so as they stand double in their mouth, for they have sour rows of teeth, two beneath, and two above, which are not only apparent by their dissection or Anatomy, but also but heir bitings, for their wounds are Quadruple, wheresoever they fasten their teeth. Their will is stender and short. But the description of this Beast was better apprehended by Gester, at the sight of one of them, which have least on this manner. he relateth on this manner:

The colour (faith he) was partly red, and partly yellow, mingled both together, but the belly white. The hinder-feet feemeth to cleave to the body or loins. It smelleth strongly, and the savour did bewray or fignifie fome fecret poyfon. The tail about three fingers long, befet with little flort hairs. The refidue of the body was three fingers long. The eyes very finall and black, not much greater then Moles, so that next to the Mole they may, justly be called, the least sighted creature among all four-footed Beafts; so that in old age they are utterly blinds by the Providence of God, abridging their malice, that when their teeth are grown to be molt fharp, and they most full of poylon, then they should not see whom nor where to vent it.

They differ as we have faid in place and number, from all four-foored Beafts, fo that they feem to be compounded and framed of the teeth of Serpents and Mice. The two fore-teeth are very long, and they do not grow fingle as in vilgar Mice; but have within them two other smal and sharp teeth, And also those two long teeth grow not by themselves, as they do in other Mice, but are conjoyaed in the refidue, in one continued rank. They are sharp like a faw, having sharp points like needles, fuch as could not be feen by man, except the tips of them were yellow. Of either fide they have eight teeth, whereas the vulgar Mice have but four, beside the two long fore teeth, which alfo feem divided into two or three, which except one mark diligently, he would think them to be

It is a ravening Beaft, feigning it self gentle and tame, but being touched, it biteth deep, and poyloneth deadly. It beareth a cruel minde, desiring to hurt any thing, neither is there any creature that it loveth, or it loveth him, because it is feared of all. The Cats, as we have said to hant it that they are not then the said that the said of the said that the said the said that the said and kill it, but they eat not them, for if they do, they confume away in time. They samply Vines, and are feldom taken, except in cold; they frequent Ox-dung, and in the Winter time repair to houses, gardens, and stables, where they are taken and killed.

If they fall into a Cart-road, they die and cannot get forth again, as Marcellas, Namer, and Pliny affirm. And the reason is given by Philes, for being in the same, it is so amazed, and trembleth, asif it were in bands. And for this cause some of the Ancients have prescribed the earth of a Carte road, to be laid to the biting of this Mouse for a remedy thereof. They go very flowly, they are fraudulent, and take their prey by deceit. Many times they gnaw the Oxes hope in the habit They love the rotten flesh of Ravens; and therefore in France, when they have killed a Raven, they keep it till it stinketh, and then cast it in the places where the Shrew-mice haunt, whereunto they gather in for great number, that you may kill them with shovels. The Egyptians upon the formst pointing of believe the short of the state o opinion of holiness, do bury them when they die. And thus much for the description of this Beat.
The succeeding discourse toucheth the medicines arising out of this Beats, also the cure of her years mous bitings.

The Shrew, which falling by chance into a Cart-rode or track, doth die upon the fame, being Marcellus. hurned, and afterwards beaten or diffolved into dust, and mingled with Goose grease, being rubbed or anointed upon those which are troubled with the swelling in the fundament coming by the cause of fomeinflammation, doth bring unto them a wonderful and most admirable cure and remedy. The Shrew being flain or killed, hanging so that neither then nor afterwards she may touch the ground, Pling. doth help those which are grieved and pained in their bodies, with fores called fellons, or biles. which doth pain them with a great inflammation, fo that it be three times invironed or compaffed about the party so troubled. The Shrew which dyeth in the furrow of a Cart-wheel, being found Pliny. and rowled in Potters clay or a linnen cloth, or in Crimfon, or Scarlet woollen cloth, and three times marked about the Impostumes, which will suddenly swell in any mans body, will very speed-

ly and effectually help and cure the fame.

The tail of a Shrew being cut off and burned, and afterwards beaten into dust, and applyed or anointed upon the fore of any man, which came by the biting of a greedy and ravenous Dog, will in very shore space make them both whole and found, so that the tail be cut from the Shrew when the is alive, not when the is dead, for then it hath neither good operation, nor efficacy in it. The former hoofs of a Horse being scraped, and the same fragments or scantlings thereof being beaten Hippocraies. in the dust or earth, which hath been digged up by a Shrew, in four measures, of water, poured down the mouth of a Hoffe which is troubled with any pain or wringing in his bowels, will foon give him both help and remedy. The Shrew being either applyed in drink, or put in the manner and form of a plainter, or hanged upon the fore which he hath bitten, is the most excellentest, and most medicinable cure for the helping and healing thereof. A preservative against poyson, would be an excellent remedy, that neither man not any other living creature, should be bitten if they should leave or would want that superstition called an enchantment against poylon, being hanged about the neck, whereof we will speak more in the curing of the bites of this Beast. . Ling's contograble with Microsty Call.

That the biting of a Shrew is venezione, and of the reason of healing in this kinde.

in list the biting of a Shrew is accounted for a very strong poyson, and that except there be Pliny. some medicine very speedily applyed for the curing and healing thereof, the party so bitten will de. These Shrews are truly so venemous and full of poyson, that being slain or killed by Cats, wholenature is to kill whatfoever Mice they take, they will not offer to touch or eat the least part

But the biting of a female Shrew is most obnoxious and hurtful when she is great with young, but Marcellus.

But the biting of a female Shrew is most obnoxious and hurtful when she is great with young, but Marcellus. most dangerous of all when she bitech any one which is great with young, either a woman or any other Best what sower sher self being allo with young, for then it will hardly be cured. If a Shrew shall bite any creature while side is great with young, the pushes or bites will in time be book which they make, and will come unto a very great and malignant would and fore. If the Shrew do also bite any creature during the time she is with young, she will presently leap off, not with standing the biteth more darigerous. There is nothing which do more apparently explain and shew the biting of a Shrew then a certain vehement pain and grief in the creature which is so bitten, as also a pricking over the whole body; with addinfiammation or burning heat going round about the place, and a fiery redness therein, in which a black push or like swelling with a watery matter, and filthy corruption dossion, and all the parts of the body which do yoyn unto it seem black and blew with the market pain, anguish, and grief, which arises and proceedesh from the same.

When the push or bile which cometh by the occasion of a Shrew cleaveth or is broken, there prowhen the path or bile which cometh by the occasion of a Shrew cleaveth or is broken, there proceeded and issued for the kinds of white steps, having a certain rinds, or skin upon it, and sometime there appeared in the steps in burning, and sometimes the same is eaten in and falleth out, but in the beginning there is most faithy green corruption and matter which stowers in the same, assessed in its purfeiled, and eaten his and then the steps falleth forth; the wringings allo of the inward parts, the difficultable volding the urine, and a corrupted tweat doth follow and accompany the same.

company the lame.

But Adverture affirmerly, that in what place loever this Beart shall bite, the fores, thereof, with great angular will pant of bear; and that in every hole wherein his venemous teeth have entred, therewill evertain fierly redness appear; the skin whereof being broken, there will come a very white and mattery fore, which will breed much pain and crouble in all the parts of the body for the most part. The fores or wounds which are middedlife by this beatt are very manifestly known by the marks Aegineta. being at the first pure, clear, and exceeding the body the blood which is light from the wound, action.

There do also the very several and exceeding the body and the blood which is a fail, of parts of the first pure, clear, and exceeding the body the blood which is light from the wound, action.

There do also the very several and the several and the

There do also divers bunches arise in the fieth usually after the biting of this Beast, which if any man shall break, he shall see the stell which lyeth under them corrupted, and divided with

some present remedy. The Normans in France; do suppose the Shrew to be a Brast so full of ye. some present remedy. The Norman in value, as there are now, or a Horse lying down along upon nom, and poyson, that if he shall but pass over either an Ox, or a Horse lying down along upon and poyson, that if he shall but pass over which a descripted states upon them, that the Beast over which nom, and poylon, that it he man but part of the ground, it will bring fuch a dangerous difease upon them, that the Bealt over which the thail the ground, it will bring judi a daily et out a sif he were immoveable, and that he can be cared pais, shall be lame about the loins, or shall seem as if he were immoveable, and that he can be cared by no other means but by the same Shrew, who either of his own accord, or by compulsion must be over the contrary side of the Beast, and that then he will be cured; which thing I do hold to be very vain and not to be believed.

very vain and not to be beneved.

For the curing of Beafts which are bitten by a Shrew, thou shalt boil the seed of Parsly together with Wine and Oyl, and thou shalt cut the place which swelleth with a Penskinse, by which the with Wine and Dyi, and thou make the pointingly pulled or torn many was raw; if by poylon may iffue forth, and the wound being pointingly pulled or torn may was raw; if by these the inflammation do was more servent and only thou shall early fore with Iron instruments thele the innamination do was more part of that which is whole and found : then initiuments burning with fire, taking away fome part of that which is whole and found : then fialt thou burning with fire, taking away former part of clear which the and rightly, by which the corruption may renew the wound with the Iron infruments being governed sightly, by which the corruption may iffue forth: but if that part do chance to well by the exculceration, thou shalt spinkle iffue forth : but it that part up thanks to anything but before you do this, it is meet to joyn the Barley being burned and dryed therein; but before you do this, it is meet to joyn the

old fat.

d tat.

There is also another excellent medicine for the curing of the Stirew, which Startonicus himfelf There is ano another excellent inculcing for fearifie the wound affoon as it is bitten, but doth much commend, which is the 10 miles of Afterwards to sprinkle Salt and Vinegar upon especially if it be compassed with an inflammation, afterwards to sprinkle Salt and Vinegar upon it, then to encourage or provoke the Beast the next day following by some sweet water or siquor to run or go fome little journey, first having anointed the fore with Fullers earth, being beaten finall and mixed with Vinegar, and then daily to nourish or bathe it with water which cometh from fmall and mixed with Vinegar, and then daily to noutrin of bathes it with water which cometh from bathes where some have washed themselves, and this in very short time being so used, will very well and altogether cure the Beast. Against the biting of a Shrew Garlick is accounted for an excellent remedy being mingled with Nitre; but if there shall be no Nitre to be had, mix it with Salt and remeny peing mingieu with thete; but it there into powder, and with the same to the the place Cumin, then to dry and beat them al together into powder, and with the same to the the place which are infected with the biting: but if the venemous wounds do chance to break; then to take which are injected with the biting. Out it the distall powder, and steep it in Vinegar, and after-Barly being scorched or burned, and pound it into small powder, and steep it in Vinegar, and after-wards to sprinkle it into the wound to This medicine Pelagon affirmeth, will only heal the bites of a wards to iprinkle it into the would be the fore, by the use of any other medicines doth rather entrease, then

Vegetius.

1-lippocrates.

Hierocles.

The flowre which is made of red Wheat, the herb called Dill, the liquor or Rozeh which runneth out of the great Cedar, and two pound of the best Wine, being mingled all together, given in a potion, and poured down the throat of any labouring Beast which is bitten by a Shrew, will pre-

fently case and cure him of his pain.

There is also another potion for the curing of the bites of this Beast; which is this; To the cloves of Garlick being bruised small, Salt, Cumin, and Wine, of each the like quantity; these being given to any Beaft to drink, doth prefently cure him; as alfo any man being anointed upon the wound, but not given to drink. The herb called Nard or Pepper-wort, being beaten to the quantity of two ounces and a half, and mingled with some sweet smelling Wine, will presently help any Beat which is bitten by the Shrew, being poured through his Nofe, and his fore being at that infant time anointed with Dogsdung: the same is also very medicinable or wholesome for men which are trou-

bled with the faid biting.

The bites of a Shrew being pricked with an Aul, and anointed with dust which is found in the furrows of Carts under the marks or fignes of the Wheel, being mingled with sharp Vinear, doth presently assware pain, and heal the fore. The earth of the track of a Cart' also mingled with state or urine, being applyed unto the bites of a Shrew, will very speedily cure them either upon Men or Bealts. A Shrew being new killed and rubbed over with Sale applyed unto the wounds which the shall bite in any Beasts, will instantly cure them : This vertue also hath the gall of a Resemble or Bat, being mixed with Vinegar.

There is a very good remedy against the bitings of Shrews, or to preserve Cattle from them, which is this to compass the hole wherein the lyeth round about, and get liet out alive, and keep her fo till the dye, and wax fliffe, then hang her about the neck of the Beaff which you would preferve, and there will not any Shrew come near them; and this is accounted to be mon certain. And thus much shall suffice concerning the bitings of the Shrews, and of the curs thereof. Softmole and the second assumptions

Of Wilde FIBL D-MICE.

The Bpithets of wilde Mice describing their kindes.

This wilde Mouse called by the Latines, Mus agressis, Mus Sylvestrie, Sylvestries, Substriances, and some say Nitrodula, (although I rather take that word to signific a Glare worth) it is filled as the substriance of the s of these Mice two kinder, a greater and a lesser. The picture of the greater we have described bets forbearing the leffer, because in all parts it resembleth this, except in the quantity.

This greater kinde is not much leffer then a Rat, having a long broad tail like it. The ears of it Their levelal are round; the head round and great; and the showt or chaps do not stand out long. They are of parts. two colours in both kindes, fome red and fome black. They have a beard betwirt their mouth and their evest, and the leffer Mice have a short tail. A Physician taking occasion of the writings of Ballianin Landins, to diffect one of these Mice, found it to be true which he faith, that their may and guts he all straight and upright. We have shewed already, that all kinde of Mice are generated out Whether Mice of the earth, although also they suffer copulation. And in Egypt it is very common about Thebai and the places where Nilm overfloweth, that in the decrease and falling away of the Waters, processes the Sun engendereth many Mice upon the flime of the earth; fo that it is ordinary to fee at one time other, their fore-parts to have life, flesh, and motion, and the hinder-parts deformed, and nothing but Alianus. 11 ...

And about this matter there is some disputation among the Authors, for there be Philosophers which affirm, that every creature as well perfect as unperfect, may be made both by feed and of putified matter; and from hence came the opinion in the Poets, of the fons and daughters of the carth, and so they say, that things grow by generation in infinitum? Some say, that perfect creatures cannot be generated in that manner, but the imperfect ones, such as Mice are, may be ingendered by feed and putrified matter, and afterwards beget more of his one kinde.

But driftste confesses the first generation, and denyeth the second, and saith; although they do generate by copulation, yet it is not idem sed animal special edversum, a quo nihil amplius gigni possi; And therefore Jeronimus Gabucinus endeth this controversie, saying! Mures ex purredine nati, generation of pis, sed quod ex ein generatur; nee Mus est, nice semina, nice amplius generat: that is; Mice engendered of putristed matter do also engender, but that which is begotten of them is neither male nor semale, neither do also engendered. not female, neither can it engender any more, that it may not proceed in infinitum, like a Mouse engendered by copulation. But concerning the beginning of these wilde Field-mice, and their encrease, Aiffoile speaketh in this manner: We have received (faith he) the wonderful generation of done by wilde wilde Field-mice, abounding in every place, and especally in corn-fields, which by their multitude, Field-mice, do inflantly eat up and devour a great deal of grains infomuch as it bath been feen, that divers poor Husbandmen, which have determined to day, to reap their corn on the morrow, in the mean feaon it was so destroyed by Mice; that when the Reapers came in the morning, they have found no

And as the encrease of these Mico was extraordinary, to also was the destruction, for men could not drive them away, as in former cimes by fmoking them, or elfe by turning in Swine to root out ther acids from the earth, or by fonding Poxes, or wilde Cats among them, but their multitude did always prevail; and yet after a few days, the fliowers of the clouds deftroyed them. And Pliny faith faith, that this oughe to be no marvail, that thereshould be so great a harvest and store of these Mitt, seing that men yet never knew how to hinder their generation, or to kill them, being encended in the men yet never knew how to hinder their generation, or to kill them, and see the second and And see gendered, and yet for all that they are feldom found in the Winter time either alive or dead. And feeing that we have entred into the mention of the damage of these wilde Field-mice, it is profitable to let down some stories out of Authors, recording the place and persons, whom they have very much

Plin writeth, as we have shewed in our former discourse, that the Inhabitants of Tross, were given former discourse, that the Inhabitants of Tross, were driven from their habitation by chose Field-mice; because they devoured all their fruits, and when they doed they devoured all their fruits, and when they dyed, there was a worm engendered in their heads. Diodoris Siculus in his fourth Book of andent Monuments recordeth, that there were certain people of Italy, which by incursion of

The History of Four-footed Beasts.

Field-mice were driven to flight, and to forfake their patrimonies, for they destroyed the roots of the riela-mice were uriven to night, and to for same the refiftible cold frost. Coffa a Town of Umbita, in the corn, like some horrible drought, or some unresistible cold frost. Coffa a Town of Umbita, in the corn, like some norrible drought, or some unterns, was destroyed by Field-mice, (as Volaterrans days of Pliny, which at this day is called Orbi tellus, was destroyed by Field-mice, (as Volaterrans days of Finy, which at this day is called Oron enight, all the Corn-fields at Calenum destroyed by writeth.) Riphus also faith, that he saw in one night, all the Corn-fields at Calenum destroyed by

Strabo.

e Muce.

There are fuch a number of these Mice in Spain, that many times their destruction caused pesti. lent difeases, and this thing hapned amongst the Romans when they were in Gantabria, for they vere constrained to hire men by stipends to kill the Mice, and those which did kill them, farfe were contrained to life interior in the Inhabitants of Gjarms, an Island of the Cyclader, after they had long reescaped with me. The innamentality of the first they were fain to yeeld unto them, and forfake their fifted the violence of thefe Mice, yet at length they were fain to yeeld unto them, and forfake their Territory; and the Mice after their departure, through hunger did gnaw the Iron. We have shewed already how the Philistener were punished with Mice, before they sent away the Ark of the Lord and already how the Philistener were punished with Mice, before they sent away the Ark of the Lord and aiready now the rangines were punished with them until they had facrificed to Apollo Sminthess, and how the Aeolians and Trojans were annoyed with them until they had facrificed to Apollo Sminthess, and how the Mice of Heracles, at the time of Grape-gathering, do go out of the Countrey and return again in the Autumn. When Senatharib, King of the Arabians and Egyptians, invaded Egypt, it is faid again in the Autumn. vytien denachatio, hing of the again in the Army fuch an innumerable fwarm of wilde by Herodoise, that Vulcan in the night time fent upon his Army fuch an innumerable fwarm of wilde Mice, that before morning they had eaten afunder their Quivers, Arrows, Bows, and all warlike infiruments, fo that the next day, for the want of weapons, and fear of their enemies, they were constrained to take their heels and run away. And to conclude, by the same means the Chelidensian were driven out of Elymnium, a City of the Mountain Athor; and thus much shall suffice for the harm of these Mice. They make their dwellings and habitation in the earth, according to this saying of Virgil:

Places of their abode.

Sub terra posnitq; domos, atq; borrea fecit.

Yet now and then they come out of the earth, although it be but feldom. They heave up hills like Moles, and they eat and devour the roots of corn and herbs. They make not very deep holes, but dig under the turis and upper face of the earth; fo that when a man walketh upon it; he may perceive it by the finking in of his foot-steps: if the hole be opened with a Spade, they close it again as a Mole doth, but not so speedily, for they deser it two or three days together; and therefore if it be watched, they may kill her at her return by treading upon her; concerning the manner of taking them, these observations following may be put in practise. These kinde of Mice are driven or chased away with the ashes of a Weefil, or of a Cat mingled

Tliny.

Palladiu.

Oriving away of these kinde of Mice are driven or chated away with the affect of a with water, and by sprinkling of scattering seed or corn abroad, or by some things well sodden in with water, and by sprinkling of scattering seed or corn abroad : and therefore they thinkit water; but the poysoning of those Mice is in the scent or favour of bread : and therefore they thinkit water; but the poysoning of those Mice is in the scent or favour of bread : and therefore they thinkit more profitable to touch the feed or corn lightly with the gall of an Ox. Apuleius doth affirm, that to foke the grain or corn in the gall of an Ox before you fprinkle it abroad, is very good against thele Field-mice: also (as it is read in Geppon Grec.) it doth very much commend the gall of Oxen, wherewith as he faith, it the feed or corn be touched, they shall be freed from the molestation or trouble

Notwithstanding in the Dog-days Hemlock-feed with the herb Hellebore is better, or with wilde Cowcumber, or with Hen-bane, or being beaten with bitter Almonds, and Bears-foot, and to mingle with them just as much meal or corn, and beat and stamp them in Oyl, and when you have so done, put it into the hollow places of these Field-mice : and they will die assoon as ever they shall talt of it. Avicen doth affirm alfo, that Hen-bane-feed doth kill thefe kinde of Mice, without the mixture of any other thing. Very many do ftop the paffages of them with the leaves of Rhododaphne, who do

perish in the time they are labouring to make their passage, by the gnawing of them.

Apuleius also saith, that the people of Bithynia have had much experience of these things, who stopped the passages of these Mice with these Rhododaphne leaves, so that they desire to come forth by touching the same often with their ceeth : which truly so soon as they shall touch or come unto the shall presently die. But they use a kinde of incantation which is this that followeth; I do it just all ye Mice, which do remain or abide here, that ye do not offer me wrong, or fuffer me to be wronged of any other. For I do aflign and appoint you this field (then he nameth the field) in which if I should surprize you hereafter, I call Lung to witness, I will tean every one of you into feren pieces: When as thou hast writ this charm, binde paper fast to the place wherein the Mice haunt and that be fore the riling of the Sun: fo that the characters or marks may appear on the outside cleaving tos natural flone of that place. I have written this (faith the Author) lest any thing should feem to be overskipped: neither do I allow or prove such things can be done, but I rather counsel all menths they do not fet their minde to any of these, which are more worthy of derision then imitation if thou shalt fill the passages of these rustical or Field-mice with the ashes of an Oak, he shall be posfessed with a servent desire to it, often touching it, and so shall die;
These Countrey Mice, that is to say, those Mice which are found in the fields, being bruised and

The medicines burned to after, and ningled with fresh Hony, doth comfort or restore the fight of the eyes byth of Field-mice. minishing the darkness or dimness thereof, in what field soever you shall finde any thing, dig them up by the roots with a little stake or post.

Of the WOOD-MOVSE.

Plin doth oftentimes make mention of this Wood-mouse, or rather a Mouse belonging to The description to Wood, but he doth it only in medicines; but that it doth differ from this Country or on. Field-mouse we have shave shewen in the chapter going before, because it doth not inhabit or dwell in the Countries or tilled places, as the Countrey or Field-mice do, but doth inhabit in Woods and Forrests. The Wood-mouse is called in Greek as the Countrey-mouse : but I think it to be a kinde of Dormouse, which proceedeth from the kinde of Wood-mouse. Pitny truly doth make the fame remedy or medicines of a Dormouse, as he doth of a Wood-mouse, as I will a little after rehearfe or recite unto you. Alfo I should have thought that a Sorex had been the same, because it is a Wood-mouse, but that, that one place of Pliny did hinder me, where he commendeth the ashes of a Wood-moule to be very good for the clearness of the eyes, and by and by after did shew or declare that the ashes of the Sorex were good also in the same use, as I will recite or rehearse below in the medicines or remedies of the Wood-mouse. Agricola, a man of great learning, doth interpret or judge the Wood-mouse to be that Mouse, to the which they do appoint the name derived from Avellana: but he doth account that to be the Sorex, which I will shew or declare beneath to be the Shrew. I do understand that there are properly two kindes of the Wood-mouse spoken of before. The one of them that which Albertus doth write, saying that there is a certain kinde of Mouse which doth build or make her habitation in trees, and of a brown or swart colour, and having also black spots in her face, which only is called by the universal name of a Wood-mouse. Of the same kinde Pliny doth mean, (if I be not deceived) when he writeth, that the mast of a Beech-tree is very acceptable to Mice, and therefore they have good fuccess with their young ones. The other which is peculiarly named the Sorex, which (faith Pliny) doth sleep all the Winter time, and hath a tail full of hair: whose shape or form we propose and see evidently before you. But that I may more di-shirtly handle those things which Pliny hath shewed to us concerning the Wood-mouse; I will write herdownseparately, or by it self, and afterwards concerning the Mouse which hath her name derived from Fil-birds, which the Germans have left in writing, and which I my felf have confidered or observed; and last of all I will write concerning the Sorex peculiarly and severally from the Andent Writers.

Theashes of a Wood-mouse being mingled with Hony, doth cure all fractures of bones, the Themedicines brims also spread upon a little piece of cloth, and covered with wooll is good also; but you must of the Woodnow and then spread it over the wound, and it doth almost make it whole and strong within the moule. spec of three or four days: neither must you mingle the ashes of the Wood-mouse with Hony too Pliny. late: Hony also being mingled with the ashes of Earth-worms, doth draw forth broken bones. Also the fat of these Beasts, being put to Kibes is very good; but if the Ulcers are corrupt and rotten, by adding Wax to the former things doth bring them to cicatrifing. The Oyl of a burned Locust is Marcellus. allovery good; and also the Oyl of a Wood-mouse with Hony, is as effectual as the other. They availe that the heads and tails of Mice mixed with the the affies of them, and anointed with Hony, dothrestore the clearness of the sight, but more effectually being mingled with the ashes of a Dormoule or a Wood-moule.

Of the Nut-mouse, Hasel-mouse, or Filbird mouse.

His Beaft is a kinde of Sorex, and may be that which the Germans tearin Ein groß Haselmui, a great Hasel-mouse, so called because they seed upon Hasel-nuts, and Filbirds. The Flemings callit Ein Slaperat, that is, a sleeping Rat; and therefore the French call it by the name Lerot, whereby allo we have shewed already, they understand a Dormouse.

For

For this sleepeth like that, and yet the flesh thereof is not good to be eaten. The colour of For this neepeth like that, and the quantity full as great as a Squirrel, or as a great Rat: upon this Mouse is red like the Hasel, and the quantity full as great as a Squirrel, or as a great Rat: upon this Moule is red like the mair, and the quantity that the head more red. His ears very great, and the back and fides it is more like a Moule, and upon the head more red. His ears very great, and the back and moes it is more more aboute, and upon his legs. The neathermost of his tail towards pilled without hair. The belly white, so also are his legs. The neathermost of his tail towards pilled without nair. The beny winter, to another line to but most at the end with white the tip white. His nostrils and feet reddish. The tail wholly rough, but most at the end with white

The eyes very great hanging out of his head, and all black, fo that there is not in them any appearance of white. The beard partly white, and partly black, both above and beneath his can, pearance of wines. and the upper part of his tail next his body all black. Upon his foreseet and about his eyes, and the upper part of his tail next his body all black. Upon his foreseet and about his eyes, and the upper part of the thumb. But upon his hinder-feet he hath he hath four claws or distinct toes, for he wanteth a thumb. But upon his hinder-feet he hath five, I mean upon each severally. The outside of his hinder-legs, from the bending to the tip five, I mean upon each severally. five, I mean upon each reverany. The outline of his mails is altogether bald without hair. And the favour of all this kinde is like the fmell of of his nails is altogether bald without hand should have said the sulfar Mice. They live not only in the earth, but also in trees which they climbe like Squirthe vulgar whice. They have not only in the sand meat against the Winter, which they lodge in rels, and therefore make provision of nuts and meat against the Winter, which they lodge in

ne earth. The Countreymen finding in the Summer their caves and dens, do wifely forbear to defroy the earth. them, knowing that they will bring into them the best Nuts and Fil-birds can be gotten, and there. fore at one fide they fick up a certain long rod, by direction whereof in the Winter time they come and dig out the den, justly taking from them both their life and store, because they have unjuly gathered it together: Some have eaten it, but they were deceived, taking it for the Dormoule.

Of the LASCITT MOUSE.

"His Mouse is called by the Germans, Lascitts, and also Harnebal, because of the similitude it I holdeth with the Erneline Weefil. The skin of it is very pretious, being shorter then the Emeline two fingers breadth. And forasmuch as else, there is no difference between the Lafcitt Mouse, and the Lastin Weesil, except in the quantity: My opinion is, that they are all one, and dis-

And I am rather led to affirm thus much, because there are skins annually brought to the Mart of Franckford, out of Polonia (cal'd Lafeet) which are no other then the Weefilsof Nove gradela, whose white skins are intermixed with griffeld; And thus much shall suffice to have said

of this Mouse.

Of the SOREX.

Of the name and kinde,

Alunnw.

Am of opinion, that this kinde of Mouse belongeth to the Hasel Mouse before spoken of because it is wilde, hath a hairy tail, and sleepeth in the Winter, all which things are by Pilay ascribed to the Sorex; only this hindereth, that he maketh the Sorex to have rough hairy ears, and the Sorex of Germany hath bald ears. For answer whereof this shall suffice, that the other three notes being so great and pregnant, there is no cause why the want of one, and that so little as the hairs on the ears, should deprive it of his naturall due and kinde. The Italians and the French use this word Sorex, for a domestical vulgar Mouse, and so peradventure did the Antients before them; but it is greater then the domestical Mouse, although Plintes Soren be neither greater nor leffer. The Spaniards call a Sorex, Sorace, or Raton Pequenno. The Illyrians, Viemegka Myli, by which word also they understand a Shrew-mouse. The fibres of the intrails of the Sorex do cacrease and decrease with the Moon, so that the number of them, do always answer the number of the days of her age.

Her ears as we have faid are full of hairs, but in the lowest part or tip thereof. The reason of her name is taken from the skreeching voice she maketh in gnawing. For it is a very harmful biting Beaft, cutting afunder with her teeth like a faw. Some do derive the Greek word from Hung, which anciently did fignifie a Mouse, and therefore they call this Syran, and Sauren, but I lift not to ftand any longer upon the name, seeing the Beast it self affordeth little worthy matter to en-

treat of.

It is reported by Varro, that in Arcadia there was a Hog fo fat, that a Sorex did eat into her fielh, and made her neft and brought forth young ones therein, which may very well be; for such is the nature of a fat Swine, that he will hardly rife to eat his meat, or ease himself of his excrements: And belides, fatnels stoppeth sense, burying both the Nerves and Arteries very deep: so that in the body of a man, his fattest part is least sensible. Lycinim the Emperor going about to restrain the infolency of the Eunuches and Courtiers, called them Tineas, Soricefq; palatinos, that is moths and Sorice of the Court

There was an ancient garment (as Pliny writeth) called Veftie Soriculata, and this was very pretious in my opinion, because it was garded or fringed with the skins of the Sorex. If this Beat all into any Wine or Oyl, the corrupteth the fame, and it is to be recovered by the fame means, as we have formerly described in the vulgar Mouse. It should seem there was great store Of the Indian Mouse.

of them in the days of Heliogabalm, for he commanded (as Lampridius writeth) to be brought unto of them not only a thousand of these Beasts, but also a thousand Weesils, and ten thousand vulgar Mice, as we have thewed before in the ftory of the vulgar Moufe.

When the Sooth-sayers were about their divinations, Pluny writeth, that if they heard the squeaking of the Sorex, they brake off, and gave over their labour, holding it unprofitable to go any further therein: and it is also reported, that the voyce of this Mouse gave occasion to Fabius Maximus to give over his Dictatorship, and unto Caius Flaminius, to give over the Mastership of the Horseto give nen, such fear of filly Bealts, was begotten in the mindes of gallant and magnanimous spirits, by

the unprofitable and foolish behaviour and doctrines of the Magitians.

It is faid by Nigitius, that these Sorices do sleep all the Winter and hide themselves like the Dormouse. They also when they eat any corn, do screetch and make a greater noise then other Mice. whereby they bewray themselves in the dark unto their enemies, and are killed, which was the occasion of that proverbial speech of Parmeno in Terence, Egomet meo indicio miser, quasi Sorex perii. Saint Austine, and Saint Origen, do also make use of this proverb, the one in his Book of Order. the other in a Homily upon Genefis, which caused Erasmus to write in this manner, Sed videbor ipse meis indidin captus, that is, I have overthrown my felf with my own tale. These Sorices do make hollow the trees wherein Emets or Ants breed, and there is perpetual hatred betwirt the Bittors, and these one lying in wait to destroy the others young.

The Medicines of the Sorex.

Serenus and Pliny say, that if a woman with childe do eat the sinews of a Sorex, if her eyes be black, fo shall the Infants be likewife :

> Si pragnans artus captivi Soricis edit. Dicuntur fætus nigrantia lumina fingi.

The fat of these Beasts or of Dormice, is very profitable against the Palsie. The powder of the heads and tails anointed with Hony upon the eyes, restoreth the clearness of fight, and with Hony Attick, the powder and fat of a Sorex burned, helpeth running eyes; and the fame powder mingled with Oyl, cureth bunches in the flesh.

There is another Moule called by Matheolus, Mus Napelli, that is, a Wolf-bane-moule : fo called. Of the Moule because it feedeth upon the roots of that Herb; although there be some of opinion, that it is not a called Miss

creature, but another little Herb growing near unto it for a counter-poyfon.

And Marcellus also maketh mention of Napellus, and Antinapellus, whereunto I should easily condescend, but that the eyesight of Mathaolus leadeth me to the contrary. For he writeth that he took one of them in the top of a high Mountain in Italy. And Sylvations calleth this Mouse Mus Suring, or Success, and calleth it a Counter-poylon to Wolf-bane, and that God might thew thus much unto men, he causeth it to live upon the roots, in testimony of his natural vertue destroying poyson and venemous herbs.

The Indian Moufe, and divers other kindes of Mice according to their Countries.

Do finde that divers times Mice do take their names from Regions wherein they inhabite, which happeneth two manner of ways: one, because the form of their bodies will somewhat vary: the other, because not only in shape, but also in wit they have some things in them common to Mice, over and above the Mice of our Countries; therefore we will briefly comprehend all their furnames Mice of the of whatsoever regions they are in one order or Alphabet. In the Oriental parts of the world, Esti. there are great Mice, (as Alexander writeth) of the quantity of Foxes who do harm both men and Bealts, and although they cannot by their biting kill any man, yet do they much grieve and moleft

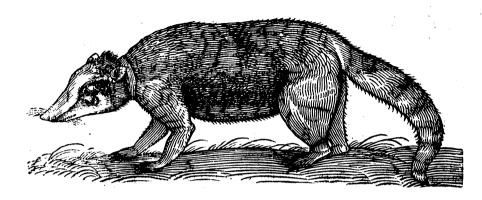

Americus Vespucius writeth that he found in an Island of the Sea being distant from Ulibona a thouand leagues, very great Mice. The hair of the Egiptian Mice is very hard, and for the most part like a Egiptian Mice. Hedge-hoge: and there are also some which walk bolt upright upon two feet, for they have the hinder-legs longer, and their fore-legs fhorter, their procreation is also manifold; and they do likewie fit upon their buttocks, and they use their fore-feet as hands. But Herodoins affirmeth these Mice to be of Africk and not of Bener; amongst the African or Carthaginian pastures (faith he) in Africk towards the Orient, there are three kindes of Mice, of the which some are called Bipedal or two-footed, fome in the Carthaginian language Zetzeries, which is as much in our language as hills, fome Hedge-

There are more kindes of Mice in the Cyrendican region : fome which have broad fore-heads 10 mp Cyrenean Mice, harp fome which have pricking hair in the manner of Hedge-hogs It is reported that in Cyrene there Pllmy. are divers kindes of Mice both in colour and mape, and that some of them have as broad a countenanceasa Cat; some have sharp briftles, and bear the form and countenance of a Viper, which the Inhabitants call Echenete, but improperly, as it appeareth by the words of Ariffolle in his book of eWon-

Egnatim.

Herodo-

tieredeins also affirmeth the like of those Mice, to be in shape and colour like Vipers : but Plim and Ariffelle do both difallow it, and fay that in those juice there is nothing common to Vipers, him only to Hedge hogs, as concerning their sharp briftles.

There are also some Mice in Egppt, which do violently rush upon pastures and corn: of which things Alianus speaketh, faying in this manner; When it beginneth first to rain in Egyp, the Mice are wont to be born in very small bubbles, which wandering far and near through all the fields, do affect the corn with great calamity, by gnawing and cutting afunder with their teeth the blades thereof, and wasting the heaps of that which is made in bundles, do bring great pains and business unto the Eppisans : by which it comes to pass, that they endure all manner of ways to make forces for them, by fetting of Mice-traps, and to repel them from their inclosures, and by ditches, and burning fires to drive them quite away: but the Mice as they will not come unto the traps, for as much as they are apt to leap, they both go over the hedges, and leap over the diches. But the Eggtians being frustrated of all hope by their labours, all subtil inventions and policies, being left as it were of no efficacy, they betake themselves humbly to pray to their Gods to remove that calamity from them. Whereat the Mice by some sear of a divine anger, even as it were in battel aray of obferving a squadron order, do depart into a certain Mountain : The least of all these issage do fland in the first order, but the greatest and eldest do lead the last troups, compelling those which are

But if in their journey the least or youngest do chance through travail to wax weary, all those which follow (as the manner is in Wars) do likewise stand still, and when the first begin to go forward, the rest do continually follow them. It is also reported, that the Mice which inhabit the Sea,

do observe the same order and custom.

The African Mice do usually die assoon as ever they take any drink : but this is commonly proper unto all Mice, (as Ephefius affirmeth) where it is written above concerning the poyloning of Mice. Mice, (but especially those of Africk) having their skins pulled off, boiled with Oyl and Salt, and African Mice, then taken in meat, doth very effectually cure those which are troubled with any pains or diseases in the lungs or lights. The same doth also easily help those which are molested with corrupt and bloudy fpettings with retchines.

The kindes of African Mice are divers; some are two footed; some have hair like unto Hedgehogs; fome faces of the breadth of a Weefil : but fome call these Mice Circumcian; fome Egyptian, as I have before declared. In Arabia there are certain Mice much bigger then Dormice, whose former legs are of the quantity of a hand breadth, and the hinder of the quantity of the joynt to the end of the finger : I do understand them to be fo short, that nothing thereof may feem to appear without the body, except the space of the joints of the finger, as it is in Martinets.

The Armenian

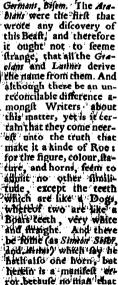

It is faid, that the garments of the Armenians are usually woven with Mice which are bred in the same Countrey, or diverfly docked with the shape of the same creature. The Author writeth, that Puny maketh mention of the Armenian Moufe, but I have read no fuch thing : therefore he doth per-Con the coffine call & Squirrel. Elianus writing of the Caffine Mice; Apprairie there are kinde of Moule which some call & Squirrel. Elianus writing of the Caffine Mice; Apprairie (faith he) in his Book entired Do Moule. Mansfonibus, which he doth so inscribe, saith the flouds, which he doth so inscribe, saith the flouds, which have great and violent currents, and holding and another but heir rails in their moules have great and violent currents, and holding and another but heir rails in their moules. ing one another by their tails in their mouths, (as it is likewife reported of Wolves) have a fure and stable passage over the water.

Of the Musk-cat.

But when they pais over any tillage of the earth they fell the corn, and climing up into trees. do eat the fruit thereof, and break the boughs: which when the Caspians cannot relift. they do by this means endevour to restrain their turbulent incursions; for they remove all things which may hart hirds having crooked talons, who come presently so flying in such great flocks, or companies, that may feem to be clouds to expel the Mice from their borders, and by a proper gift incident unto them by nature, do drive away hunger from the Caspians. Neither in quantity are these Mice inferiour to by nature, they are also ungentle, and they do no less devour with the frength of their teeth, then the Mice of Teredon in Babylon do Iron, whose softs skins the Merchants carry to the Persians. The Indian Mouse, or Pharaobs Mouse (as some learned later Writers do write) is no other then the Ichneumon. Antonius musa Brasavolus, took the before expressed figure of an ladian Mouse, (for so he did call it) which before that time was shewn by Bellonius, and I quessed it to be an Ichneumon; and truly in the snowt (if you take away the beard) and in the ears it doth agree, but in the tail it doth differ, which doth rather refemble a Cats and in many other things, which by conferring them are easie to be marked, and as I conceived it, I have fet it down.

Of the Moschatte, or Musk-cat.

This Beafts name is derived from the Hebrer word Bosem. which I fignifieth sweet odour, for the German call the same Bifm, and the Beast it self Bifembier. And the Gracians derive their Moschos of Moo and oze, to feek, and to fmell, and of Me fou Cheifthai, to proceed out of their middle; because the true liquor cometh out of the navel, as we shall shew: but I rather think they derive it from the Arabian words Mesch, and Misch, and Almisch, The Italians, French, and Spaniards wie Musci and Muschi, which is derived from the later Latines; and beside the Italians call it Capriolo del Musco; and the French, Cheureul du musch : the Musk it felf is called in Italy, Muschio: of the Latine, Mulchum, and Mulcatum: the Illyrians, Pizmi; and the Germans, Bifem. The Ara-

ever faw one of these Beasts doth so much as make mention thereof; and therefore the original of this error came from the words of Auton, who writern that his reeth bend inward like two hors. Cordan writeth, that he saw one of these dead at Millain, which in greatuels, sastion, and hair resembled a Roe, except that the hair was more thick, and the colour more gray. Now the variety of the hair may arife from the Region wherein it was bred. It hat he wood two beneath, not differing absolutely from a Roe in any thing except in the layour. It is called the layour. It is called the layour that the layour the layour than the layour than the layour than the layour that the layour than the layour Gezelle, they are lesser, thinner, and more elegant creatures then the Roes are. Paulus Venette writerh thus of this Beast. The creature out of whom the Muskis gathered, is about the bighter of a Car. of a Cat, (he should say a Roe) having gross thick hair like a Plart, and hoofs upon his feet. I

A wonder in the Fgyptian Mice.

Ælianus.

Piny.

The Arabian

Of the Musk-cat.

is found in the province of Cathay, and the Kingdom of Cergoth, which is subject to the great King

Likewise there was a most odoriserous Musk-cat at Venice, which a Merchant there had to be seen brought as he faid out of Cathay, and for proof whereof he shewed the way that he went, namely brought as ne raid out of Caimay, and Albania, even to the entrance of Scythia. For the Countrough the Euxine Sea, Colchia, Iberia, and Albania, even to the entrance of Scythia. For the Countrough the Euxine Sea, Colchia, Iberia, and Albania even to the entrance of Scythia.

Braffavolus.

through the Euxine Sea, Colonn, Iveria, and January, 1981 this to feem wonderful, for in that place trey Cathay is a part of Scythia, beyond Imans, neither ought this to feem wonderful, for in that place trey Cathay is a part of Seyinia, Deyond amans, fientier ought and the placeth the eleventif Table of there was a Region, called by Ptolemeus, Randa marcofira, wherein he placeth the eleventif Table of there was a Region, casted by the River Sotus, and therein aboundeth Spikenard, and the Inha.

Afia. This Region is watered by the River Sotus, and therein aboundeth Spikenard, and the Inha. Ajia. 11118 Region is watered by the liver beat Musk-cats are bred, Ergimul, and the greatest City of that bitants call the Countrey wherein the per than a long that Musk-cats are brought out of Figure, and Countrey Singuy. The same Author writethalso, that Musk-cats are brought out of Figure, and Countrey Singuy. I ne same Author whitestrain, and the many Cities, and Beats about those Ciout of many places of Africk. In Thebeth also there are many Cities, and Beats about those Cities called Godery, which do bring forth the Musk; and the Inhabitants hunt them with Dogs. The ties caned Gazery, which do bring forth that you fine Beafts, and likewife Syria. S. Jerom also Province of Caniclust, doth also yeeld many of these Beafts, and likewife Syria. S. Jerom also Province of Canicius, doction and yellicula, by which skin of the strange Mouse, writeth thus: Muscus & Oenanibe, & peregrini muria pellicula, by which skin of the strange Mouse, writeth thus: mujeus of commine, or skin wherein the Musk of the Musk-cat is included. The Princes of he meaneth the little bag, or skin wherein the Musk of the Musk-cat is included. The Princes of ne meaneth the necessary, of shift whether out of the New-found World, and many other rich men especially in Italy, be delighted with the odoriferous favour which cometh from it. Of the Musk,

thereof.

men especially in alus, be designed with the feet one of these to be sold unto Alphonsus Dake of Ferrara, which lus saith, that he saw a Merchant offer one of these to be sold unto Alphonsus Dake of Ferrara, which had the Navel full of Musk. And Catherinus Zenus, an ancient Nobleman of Venice, had a Roe nad the mayer run of mans. The death unto his heirs; and by this it doth plainly appear, that of this kinde, which he left after his death unto his heirs; and by this it doth plainly appear, that or this kinde, which he left after his weath unco his delie, and that all those which have affirmed so much the Musk-cat is neither like a Cat, nor a Mouse, and that all those which have affirmed so much thereof, have been deceived of their own conjectural derivation of Moscus or Museus, or by the thereof, have been deceived of their own conjectural derivation of Moscus or Museus, or by the errour of some Writer of the ancient Books, which instead of Magnitudo Capreoli a Roe, have inferrour of tome vitter of the amendation of the Beaft, and for the ferred Catti, a Cat. And thus much shall suffice for the description of this Beaft, and for the Regions where it is bred, except I may adde the Relation of Ludovicus Romanus, who affirmeth, that the Musk-cats of Calecut are brought out of the Countrey Pegus. These Roes of the New-foundthe Manager of the rew-found-tand are wonderful nimble and quick, and so swift, that they are seldom taken alive; but after they are taken, by pulling out their longer teeth they wax tame. When they are profecuted with the Hunters, and with Dogs, they defend themselves with their teeth. In some places they take them in

finares, and with Dogs, they derend themselves with their teeth. In Joine places they take them in finares, and in ditches, also kill them with darts; and so having killed them, they cut off the little bag wherein the Musk groweth for that Musk doth exceed in sweetness of odor all things that were bag wherein the Musk groweth for that Musk doth exceed in sweetness of odor all things that were made by the art of man, and therefore the use of it is more plentiful then of any other thing, Alex. Benefor they carry it about in Garments.

They make perfume of it; they anoint Beads where upon they tell their prayers; they also make Bale of it, and include it in Gold or Saver, carrying it about, either to be seen, or because they are delicate and wanton; or to shew their riches and abundance; or to preserve themselves from putrified and flinking airs; or else against cold and most diseases of the brain. With this the luxurious women perfume themselves, to entrapthe love of their Wooers: for as the thingit felf is a vice or ficknels of the Braft; fo also by men it is used to vice and wickednes; yet the Ventian Matrons will never use it, and he that beareth it about him. Thall never perceive it

The natural expression of Musk.

We have thewed already, that it groweth in the navel, for in a little bag neer unto it; and it is where the true by Gyraldus and Various, that when the Beaft beginneth to be luxurious, and prone to the rage of venery and carnal copulation, then the bloud floweth to the navel, and there putteth the Beaft to pain, because it swelleth above measure. The Beast then abstaineth from all meat and drink, and rowleth himself upon the ground, and so by the waight of his body presseth forth the humor that troubled him, which after a certain time doth coagulate and congeal together, and then rendereth fuch an acceptable favour, as you fee it hath. The relation whereof you shall hear out of the words of Serapion. The wilde Roes (faith he) which wander to and fro in the Mountains freely, without the government of man, have in a little bag, certain putrified matter or bloud, which of it felf groweth to be ripe, whereunto when it is come, the Beaft itcheth, and is pained as it were wish launcing, therefore he rubbeth himself upon stones, rocks, and trees, a great while together, for it delighteth him, whereby the frones grow white through his rubbing, and therefore in time he wearcth the bag afunder, making iffue unto it for the corruptible matter to come forth, which prefentin runneth out upon the fores, no otherwise then if it had been lanced. Then the wound groweth to be whole again, and the Beaft departeth, until the like exsuperance of bloud come into the same place again. For every year this happeneth them.

The Inhabitants of the Countrey know all the Hunters of these wilde Beasts, and therefore note them where they empty their bellies. For the humor fo pressed out as before is declared, through the heat of the Sun congealeth and dryeth upon the stone, growing more commendable and please fant through the Suns heat; Then come the Inhabitants, and in little bottles made of the skins of

shele Bealts, which before they have killed, and so put the musk into them.

This they fell for a great price, because it is thought, (and that worthily) to be a gift fit for a King. But if this Musk be taken out of the creature by violence, then will be bring forth no more a verexpression by his own required at he hearth again. MAKE a yet express it by his own natural art he beareth again and again. The greatest cause of the humon is the sweetness of his food, and the air wherein they are bred; therefore if one of them he brought into this part of the world with the true of the world. be brought into this part of the world, with Musk in his cod, it will grow to ripenels in a temperate

rate air, but if it be brought without Musk in the cod, then it will never yeeld any among us : and besides that it liveth but a little while. And therefore my opinion is, that this excremental humour is unto it like a mentruous purgation, for the want whereof it dyeth speedily. Every part of mour, is unsealled Musk, which cometh forth of his ulcerous iffue; for although the other parts fmell this near yet we will shew afterwards more at large, that it is not of themselves, but by reason of this

union.
The pretiousness of this thing deserveth a further treatise, for thy better direction and instructi- The best musk on of the knowledge hereof, both for the choise of that which is best, and for the avoiding and declared by on of the another which is adulterate. At Venice at this day it is fold in the cods, and the Indian thee leveral putting away of that which is adulterate. At Venice at this day it is fold in the cods, and the Indian Countries. Musk is better then the African. The brown is always better then the black, except it be of Catha : for that of Catha is black, and best of all. There is some that is yellowish, or betwixt red and yellow, after the very same colour of Spikenard; this also is of the best sort, because the Beatts that render it do feed upon Spikenard.

Therefore this is good to be chosen, because it cannot be adulterated, and besides the tast of it is Sylviw. bitter, and affoon as ever it is tafted, it prefently afcendeth to the brain, where it remaineth very fragrant without resistance, and is not easily dissolved. It is not bright within, but muddy, having Avicenna. broad grains, and equal throughout, like the wood of Baulm. But according to the Regions, they

chuse Musk in this fort.

Of the Indian Musk, that of the Region of Sceni, (called Antebeum,) they fet in the first place, and next unto it, the Beafts of the Sea fide; The Musk of Cubit is known by the thin bladder of the Beaft Elluchacem. whereinit is contained; but that of Gergeri, is less Aromatical, and more thick. The Musk of Catam is in the middle place betwixt both, wherewithal they mingle powder of Gold and Silver, to encrease the waight. The musk of Salmindy is worst of al, because it is taken out of his bladder or cod, and out into a glass. There are some which preser the Tumbascine Musk, and they say, that the odor thereof cometh from the sweet herbs whereupon the Beast feedeth, and the like is said of the Region of Sceni; but the odor is not equal to the other. And the Tumbalcines do not gather the Musk after the fashions of others: for they draw not forth this matter out of the cod, nor yet gather it in calm weather. The Genians, they press forth the matter out of the ventricle, and when they have it forth, mingle it with other things, and that in cloudy and temperauous weather: afterwards they put them up in glaffes, and ftop the mouth close, and fo they fend it to be fold unto the Saritines, and to Amania, and to Parfis, and to Habarao, as if he were a Tumbesoine. When this Beaft goth furthest from the Sea, and feedeth toward the Desert upon Spikenard, then is his Musk inteter, but when they feed neer the Sea, it is not so fragrant, because they feed upon Myrrh. Avien faith, there is some kinde of Musk like a Citron, but such hath not been seen in this part of the world, for our Musk is most commonly like the colour of Iron, and the savour of it like a Cyre- Serap. nim Apple, but stronger, and consisteth of little pieces, but it is better that hangeth together, and hatha layour of the Wilderness; but if it be adulterated with Snakes or Birds-dung, then will it be kilks pleasant in the savour, and also pinch and offend the nose.

The Hunters of Tebeth, and Sent, as we have shewed already, do kill their sweet Rose, and afterwardstake out from them their bladder of Musk, which Musk being excerpted before it be ripe, smelleth strongly and unpleasantly. And then they hang it up a little while in the open and free air, wherein it ripeneth as it were by concoction in the Sun, and thereby receiveth an admirable sweetnels. And the like do divers Gardners use towards Apples, and fruits of trees which are gathered before they beripe. For by laying them up in a dry place, they wear away their sharpness and become pleasant. But it is to be remembred, that Musk is the best which doth ripen in its own cod, before it

betaken out of the Beaft, for before it is ripe, it smelleth displeasantly.

There is not much perfect Musk brought into this part of the World, but the strength of it cometh from the vertue of the cod wherein it is put, and fo it is brought to us; but the best is brought out of the East, where groweth Spikenard and sweet herbs. Rodericus Lustanus faith, that our Musk is compounded of divers things, the ground whereof is the bloud of a little Beast like a Cony, which is brought out of Pegun a Province of India. But the means whereby to try it may be this, after it The tryal of is waighed, they put it into some moist or wet powder, and after a little while they weigh it the fe- Musk. cond time, and if it exceed the former waight, then do they take it for found, perfect, and good, but

if it do not exceed, then do they judge it adulterate.

Some Merchants when they are to buy Musk stop it to their noses, and holding their breath run Simion Cabi. halfa stones cast, afterwards they pull it from their nose, and if they perceive the sayour of the Musk, Sylvim. then do they buy it, and take it for good, but if not, they refuse it for corrupted. In some Churches they make perfumes with Musk, and by mingling Stirax, Aloes, Amber, and juyce of Roses, they make a persume called Regium Suffumigium, the Kings persume; likewise unto sweet waters, drawn out of the furnaces of Chymists, whereunto they add simple Rose Water, and for the richer sort of people Musk and Camphory.

Andrew Furnerium, in his French Book of adorning mans nature, teacheth a composition to be made of certain Oyls, Sope, and Musk; and also Ointments and musked Oyls. He also sheweth how to Platearing. make little round Balls of Musk, and other confections, and afterwards to draw a thread through the middle of them, and fo wear them about ones neck.

Some put it into Silken wool, through which they first draw a thread, and so dissolve it in Rose The preserve water, afterward make it up in medicines, and use it as aforesaid. It may be preserved in a vessel of ving of Musk. Lead,

Lead, close stopped a long time, for the lead which is cold and moist, agreeth well with the nature of Lead, crois rropped a long time, for the lead winds ting, fo as ye be forced to use glass and filver, the Musk, and therefore if a leaden vessel bewanting, so as ye be forced to use glass and filver, the Musk, and therefore is a leaden venter to wanting, for the better prefervation, and covering the then must you put two or three pieces of lead into it, for the better prefervation, and covering the then must you put two of times pieces at the passage all over with Wax, and above all things you must avoid all kinds of Spices, taking heed that passage as over with wax, and above as timing, you make the favour and be dead, then it is no grain thereof come into it. If while it is in the vessel it lose the favour and be dead, then it is no grain thereor come into it. It want to be recovered by opening the mouth of the Vial, and hanging it over a privy; for when the flink to be recovered by opening the mouth of the Vial, and hanging it over a privy; for when the flink to be recovered by opening the mouth of the fatorem eludatur, & quafi luttando revivifelt, it ftriveth and evill savour cometh unto it, Contra fatorem eludatur, & quafi luttando revivifelt, it striveth and evil 12 your comets and so it were reviveth in that contention, faith Isidorm, Albertm, and

Benedictus. The adulterating of Musk, to descry it.

Platearine.

But concerning the adulterating of Musk, I will fay more in this place. First of all, the Mountebanks do corrupt it by mingling with it the liver of a Calf. Also by a root called Makir, and an herb banks do corrupt it by mingling with it the liver of a Calf. Also by a root called Makir, and an herb banks do corrupt it by mingling with it the liver of a Calf. Also by a root called Makir, and an herb banks do corrupt it the deceit herein, that a man may not truit the outward shape of an intire cod, for there be Imposters which can counterfeit may not truit the outward shape of an intire cod. may not trust the outward mape of an incide tod, the tiere and fill them with certain suffe, them, and make them in all parts for the outward appearance, and fill them with certain suffe, interpoling some little true Musk among it until it have a reasonable savour, and therewithal

trive numple people. It is also adulterated by mingling with it a little Goats bloud fryed, or brown Bread fryed, so that three or four parts of these, will receive seasonable tast from one part of the Musk. It is also adult terated in the skin by putting pieces of the skin into it, and it may be known from the true Musk, because it will weigh twice so heavy. The Sarazens use this shift above all others, and there is one principal way of making counterfeit Musk, which is this; they take Nutmegs, Mace, Cinamon, principal way of making confection was your one a handful, all these being beat diligently toge. ther, and dryed and fifted, they are mingled with the warm bloud of a Dove, and afterwards dryed in the Sun, then are they seven times sprinkled over, or moistened with the water of Musk-roses, and betwixt every sprinkling they are dryed; at length they mingle therewithall a third or fourth part of true Musk, and then fprinckleit over again with Musk-rose-water, so divide it into three or four lumps, and take the white hairs from under the tail of a Roe or Kid, and fo put it in a vellel

Benyvine, white Wax taken out of a new Hive of Bees, the rotten part of Eve-tree, and a little Musk, are mingled all together to make a counterfeit Amber, for it will finell like Civet, or Musk, or else Stirax, and the powder of Lignum aloes, with Civet, and Rose-water; but the fraud in one and other is easily deprehended, for both the odor and the colour are different from the true Amber,

and also it will sooner wax soft in water, then that which is natural.

Some do corrupt their Musk with the feed of Angelica, or rather with the root of it, because the root smelleth sweet like Musk, but the cosenage may be easily discovered, by putting it into water: for the Angelica will fink, and the Musk will fwim. The true Musk is fold for forty shillings an ounce at the least. It is also observed by Annelde Villanovanus, that in the presence of Affa fatide or Cafte. reum, the best Musk will have a horrible and intolerable savour, although they touch not one another, which cannot be afcribed to any known reason, but to some secret in nature. The sweeness of the Arabian Musk is described by Alciatus in this verse;

Et celebris suavi est unguine Muscus Arabs.

There be divers herbs which smell sweet like Musk, as Angelica, Dorsis, Musk-gillisowers, Muskgrapes, the leaves of a Winter Cherry, and an herb growing near Bafil without a name, like wilde Parsley, the Damasine-rose, and many other. Wilde Cats and Martins do also render an excement much like Musk; and there are Hares called Mofchia, which leave such an intolerable feel in the impression of their foot-steps, that the Dogs by touching them grow mad, as we have shewed in the story of the Hare: And thus much for the description of this Beast; now followeth the medicines.

The Medicines of the Musk-cat.

A very little part or quantity of a Musk-cat is of great vertue and efficacy; wherefore it is very sparingly used in medicines or potions, neither is there any part thereof beaten or bruised, as it is of all other Beafts, but it is melted and diffolved in water which proceedeth from the sweetek Rofes. It is also a Beaft which is very hot and dry, but rather more dry then hot, yet not withstanding the same his heat is asswaged and allayed by no other thing but only the Gum called Camphing, and his desiration of the Camphing and the Camp Camphire; and his driness is only moistned or mollified with Oyls, and very sweet, as Oyl of Violet and Oyl of Posses, a Oyl of Posses, and or of Oyl of Posses, and or of Oyl of Posses, and Oyl of Oyl of Posses, and Oyl of O olets, and Oyl of Roses. Amongst sweet smels and savours, the principallest and chiefest laud and commendation is attributed uncoche for the laud and chiefest laud and commendation is attributed uncoche for the laud and savours, the principallest and chiefest laud and commendation is attributed uncoche for the laud and savours, the principallest and chiefest laud and commendation is attributed uncoche for the laud and savours, the principallest and chiefest laud and commendation is attributed uncoche for the laud and savours. commendation is attributed unto the smell which proceedethsrom the Musk-cat: For he doth not only with his odoriferous and delightful favour please and content the scent of men, but also don ftrengthen the spirits, and all the parts of mans body, yea and that in a moment, for the flendericks of his parts which alsh and is a spirit which alsh alsh and is a spirit which also a spirit which a spirit which also a spirit which are a spirit which of his parts, which although it doth forthwith penetrate or enter into the fcent of min, yet doth it endure longer, and is not so speedily or quickly dissolved as the scent or savour of any other sweet fmell whatfoever.

A Must cat and the herb called Mercuries fingers or Dogs bane, being given in purging medi-A must drink, do greatly renew and refresh the decayed strength or force of those which have been before times weakened with divers and continual medicines in their members. The fame is also very profitable for those which are effeminate or defective, and eclipsed in their minde or courage, very promitted infinite or courage, as another fire being enfectled, but being always fo even from their childhood. A Musk-cat is an excel- Symeon. lent remedy for those which are troubled with fear in their heart; and also for those which do quiver or shake either for fear of any other thing throughout all the parts of their body. The same Ifiderut. yer of the profitable and medicinable cure for those which are grieved with any ach or pain in their head, or with any enormity, or trouble in their liver, and is also being given simply by it self. without any thing mixed in it, or compounded in Wine, very good and wholesome for the healing and curing of those who have any pain or grief in their stomach, which cometh by the occasion

A Musk-cat being put unto the body of any man in the form or manner of a plaister, doth confirm Dioscorides. and make strong both his heart and all the rest of his bowels, or interior parts: it doth moreover encrease both strength and power in all his members, yea and in the very bones, the efficacy thereof is of fuch and power and vertue. The same being laid or anointed upon the head, is very effectual for the expelling or driving away of the rheume which falleth from the head into the nostrils, and by that means procureth heaviness in the same; and for the amending and curing of the swimming diz-ziness or giddiness in the head through the abundant humors which remain and stay therein, and also

for the bridling and restraining of lust and venery.

The same being used in the aforesaid manner doth temperate and confirm the brains of any man, Avicenne. befides it eafeth and helpeth those which have pain about their heart, by the which they suppose their very heart to ake. The smell of this Beast is both profitable and hurtful; for unto those which are cold of constitution, the scent is very pleasant in regard that it is hot of it self, and is very delightful in their favours: but unto those which are hot of nature it is very notiome, in re- Rafie. gard that the heat and strong scent thereof overcometh their senses, and oftentimes causeth their heads to ake, and be full of pain; and doth also stir up in them that pestiferous disease called the Falling-fickness: but unto women which are of a hot and flery constitution it is more hurtful and noisome, for it breedeth in them a very pestiferous disease, which choaketh their Matrice or Womb, and causeth them oftentimes to swound, it is also called by some the Mother. The sneez- Brassavelus. ings of a Musk-cat is an excellent remedy against the resolution of the sinews or the Palsie. A Muskcut is very good and wholesome for the helping and curing of those which are troubled with any dusties or astonishment in any part of their bodies; as also for the driving away of melancholick and forrowful passions out of mens mindes, and for the incitating delightful mirth and pleasure

A Musk-cat being mingled with dry plaisters which are used for the healing of the eyes, is an excel- Plateatius. kniremedy for the expelling and driving away of the white skin which doth usually cover the fight, solfor the drying up of moilt rheumes and humors, which in the night time do fall from the brains and the head, and by that means doth much hurt and damage the fight of the eyes, as also for the clarifying and healing up of any pain or difease therein.

A Musk-cat is an excellent remedy for those which have a defire to vomit and cannot, it doth also renew an appetite or stomach in those unto their victuals which do loath and abstain; from all sustenance, and doth loofen and diffolve all thick puffings or windiness in the interior parts or members of any one,

A Musk-cat being mingled with a caustick medicine, is very profitable and wholesome for the bringing forth of those Womens menses or fluxes which are stopped, and also for moving concepti-

on in those women which are hindered in it by the occasion of some great cold.

A medicine or suppository being made of Ambergreese, and mingled with a gum comming out of Spia called Spraw, and then mixed both together with a Musk-cat and so beaten, until they come unto a certain falve, and laid unto the secret parts of a woman, is very good for the aforesaid disease, There is a certain juyce or moistness in a Musk-car which being pressed forth or distolved, and mixed Avicenna. with the Oyl called Palma Christi, and anointed upon the yard of any man, doth thir him up to lust and venery. If the least part of a Musk-car be gaten by any one which is troubled with a stinking breath, it will presently expel and take away the Mink thereof. And thus much shall suffice concerning the cures and medicines of the Musk-cat;

Of the MPLE.

The Mule is a Beaft, called by the Hebrews, Pered, from whence comes the feminine Pirdab 2. of The fiveral King I and there be somethat say that the reason of the side comes and the sparaname. The first and there be somethat say that the reason of the side word say from the separaname. The chard, word so this Bealt, for it is Pered, quie non parise. The Chard, word is Cudana, the Arabian, Regal, but Gen. 36. for the Hebrer word Jemin, many transfers, Mules The Arabians, Kegal, but the Gracian Septuagints, Hemianous. The Gracians also call a Mule Arabe, from the strength of his hody. his body. The Latines call a Mule Mulus, and Semiafinus, that is half an Als, because on the one side he is an Horse, and on the other side an Ass, and therefore in his conditions he more resembleth

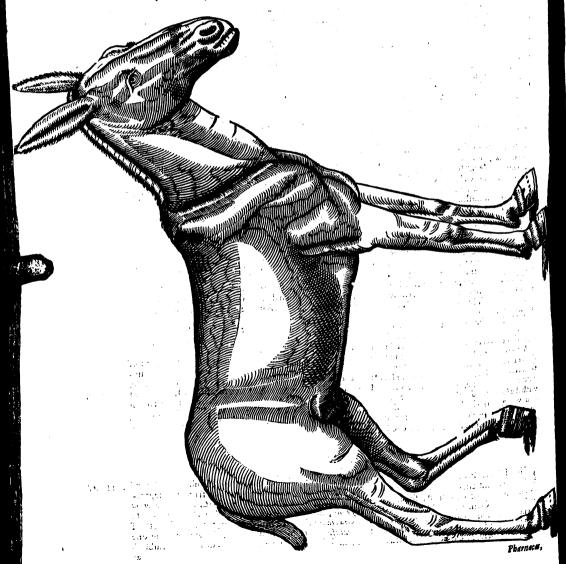

Plutarch.

432

an Als then an Horse, whereupon lyeth this tale. A certain Lydian Mule seeing his Image in thewater, grew to be afraid of the greatness thereof, and thereupon took his heels and ran away as fall as he could; neither could he be stayed by all the wit of his Keepers: At length the Mule remembring that he was the fon of an Afs, he stayed his course and came back again neighing. The Italians call a Mule Mulo, and the female Mula, like the Latines, and the Spantards. The French, Mulat, and the female Mule, from whence cometh the English word Mule. The Germans, Multhire, or Mulejel. The Illynam. Mefeck , and the Flemings , Mul.

Divers kindes of Mules.

There is another kinde of Mules in Syria, divers from those which are procreated by the conn lation of a Mare and an Als, and they receive their names from the similitude of their faces. For there is no other cause, why wilde Asses should be called Asses, but only their similitude of tame Asses. And as among wilde Asses some of them are singularly swift, so also among these System Mules. there are some excellent speedy Coursers. These Mules procreate in their own kinde, and admit no mixture, which Ariffole proved by nine of them which were brought into Phrygia, in the dayes of

Pharnacis, the father of Pharnabasus. Theophrafirus also reporteth, that in Coppadocia, the Mules en- Pline. Pharmacon, the latest of Control gender smooth they are a kinde of Cattel among themselves. There be flocks of Asses and Mares in In- Elianus. dia, where the Mares do willingly admit the Affes in copulation, and bring forth red Mules, the best of all other for running.

But among the Indian Phyllians, their Asses, Mules, Oxen, and Horses, are no bigger then Rams. The generati-As the Mule is begotten betwixt an Ass and a Mare, fo the Burdon is begotten betwixt a Horse, and on of Bur-As the mule before the Italians call him Mulo Bastardo, that is, a Bastard Mule. For as the Mule dons. a ince air, more resembleth the As then the Horse, so the Burdon more resembleth the Horse then the As: the Mules and more territoris; because all kindes follow the father. The Mule hath some parts proper to the As, as their colour. long ears, a terrible voyce, a cross upon the shoulders, small feet, a lean body, and in all other things ic relembleth a Horse. The length of their ears serveth instead of their fore-top, their color is somewhat brown, but it varieth; for the Roman Cardinals have Mules of an ash-colour, and those very great ones with long tails.

They change their teeth, and have in number fix and thirty, their neck is like the neck of an Affes. long, but not standing upright, their bellies simple and of one quanty, They want a gall like all four-footed Beafts; and there is a thing in their heart like a bone, as we have thewed before in the flory of the Als.

They eat fuch food as Horses, and Asses do; but they grow fat by drinking, yet they drink not The food of like a Horle, by thrusting in their noses into the water, but only touch it with their lips.

They love Cucumbers above all other meats, but the flowers and leaves of Rhododaphne are Mizaldur. poyion to Mules and Affes, and to many four-footed Beafts. Both a Mule and a Horse grow from Discortifet. the first coming forth of their teeth, (by which their age is discerned) and after all their teeth are The length of come forth, it is hard to know their age. The females in this kinde are greater, more lively and a Muleslife, live longer then the males. It hath been found that they have lived to fourfcore years of age. Such age was presented at Athens, at what time Perioles builded the Temple of Minerus, where by reason of his age, he was difmiffed from all labour, yet afterwards he would not for fake his companions, but went with them, exhorting them with neighing to undergo the labour cheerfully; whereupon there Aristotle.

was publick decree, that the said Mule should have an ordinary of provender appointed him in Pry-Elianus.

untim, and that no body should drive him away from their Corn when he eat it, although it were in

We have shewed already that this Beast is engendered betwirt an As and a Mare, and therefore The generation if a man would create unto himself a notable breed of Mules, he must look to the choice both of on of Mules, humaleand female. First of all for the female, that she be of a great body, of found bones, and The election

of fingular good shape, wherein he must not so much expect her velocity or aptness to run, as of a Mare to her friength to endure labour, and especially to bear in her womb a discordant foal, begotten by Mules. an Als, and to confer upon it both the properties of his body, and the disposition. For when Mare do unwillingly receive the genital feed of the Afs, the foal doth not grow to perfection in the Marcs belly, until the hath born it thirteen months, whereby it refembleth more the pling. fluggish and dull nature of his father, then the vigor of his mother. But for the helping of their

copulation, they pull certain hairs out of the tail of the female, and afterwards binde them toge-

ther therewith. There is no leffer regard to be had of the Stallion, left the want of judgement in the choice of The choice of him do frustrate the experiment; seeing therefore they are engendered betwixt a Mare and an Ass, a Male. or betwixt a Mare and a wilde Ass, and the Mule, begotten betwixt the wilde Ass and the Mare, doth excelall others, both for swiftness of course, hardness of foot, and generosity of stomach: yet is the tame As better for this breed then the wilde As, for he will be more beautiful in outward form, and more tractable in disposition; and the Mules engendered by wilde Asses may be compared to these; yet can they never be so tamed, but they retain some qualities of their wilde father; and thereforea Mule begotten betwixt them (I mean betwixt a wilde male As and a tame female As) are fitter for Nephews then for fons; that is, their foals may beget good Mules, and fuch as are tameable and tractable, because descent breaketh the corruption of nature, but themselves do never prove profitable.

And therefore it is most commodious and necessary to get such a Stallion Ass to the procreation of Mules, whose kinde by experiment is excellent, and outward parts every way acceptable, such asthefeare; a long and great body, a strong neck, strong and broad ribs, a wide breast full of mulcles, loins full of finews, strong compacted legs, of colour blackish or spotted, for the Moule colour ishtoo vulgar, and is not fit in a Mule. For it is but folly in a man to allow and approve every colour he looketh upon, and therefore (Columella writeth) when there are spots upon the tongue and palat of a Ram, such also are found in the Wooli of the Lamb he

And so also if an Ass have divers coloured hairs upon his eye-brows, or upon his ears, the foal he bringeth forth hath fuch colours in his skin; And hereunto agree both Palladius, and Absistus, faying; he that will have a good breed of Mules, must get an As of elegant form, a great stature, quare members, a great head not like a Horses, his face, cheeks, and lips not small his eyes standing out of his head, and not little or hollow, broad nostrils, great ears, not hanging down, but flanding upright; a broad and a long neck, a broad breaft, rough with the plaights of his muscles,

The History of Four-footed Beasts.

and strong to endure the kickings of the Mare : great breaks, plates, and other parts under his shouland strong to endure the Rickings of the Marte Brand, broad, and corpulent, and Randing far affine ders, and so down to his legs, which ought to be strong, broad, and corpulent, and standing far affine der, fo as he may easily cover the Mare.

A great back, and broad back-bone, neither hollow, nor standing up with bunches, bearing a die A great back, and broad back-bone, netther hollow, but standing up, the hip-bone full, and long, not rect line upon the middle. His shoulders not low, but standing up, the hip-bone full, and long, not rect line upon the miquie. First inquiders not low, but and they are best which have the bending too narrowly nor pinde buttockt, nor standing out sharp, and they are best which have the

fhortest tails.

Furthermore let his stones be great, his knees great and round, standing both alike, his less bony and without steff, nothing appearing in them but nerves and skin, not standing away, nony and without nein, nothing appearing in not yet over-low: his feet not low nor bending in-nor yet of divers colours, his patterns not high, nor yet over-low: his feet not low nor bending in-ward; his hoof thick and hollow within; the inward part of it being clear, according to the faying of Juvenal:

Namq; hic munde nitet ungula Mule.

His voyce clear and not hoarfe, for fo the Mare will be terrified from copulation. His colour ought to be likewife clear, as all black, having no white belly; or fomewhat looking towards purple, and having one black foot upon his mouth, or rather a black tongue, and fuch as hath been brought up with Morfes.

It is the fashion of some to take wilde Affes to tame them, to make Stallions for generation, for they beget the ben Mules, if they be liberally fed and not inclosed, and never wax wilde against they they beget the beat states, in they be interany totaling hot more many will be like the fyre; and if any be put among tame Affes. And the young one to gotten by him, will be like the fyre; and if any have a defire to hake the Mules of strange colours, they must cover the female with a city of that golour, wherewith a they defire the young one to be foaled, as we have shewed already in the difdourle of Horses, whereby there are raised many excellent kindes and races; or esse they bring in their presence at the time of their copulation some great Male Horse or Als, by the fight whereof they are made more fruitful, or again, some base and despisable Beast being offered to their view, doth make them to conceive mose noble Mules.

uoth make them to conceive more noble Males.

If the wilde Affes be at any time heavy, and not willing to cover the Mare, then let there be another female. As brought into the prefence, by the fight whereof his luft to burneth, that he rageth almost to madness for copulation: And therefore being denyed, the Ass doth more willingly leap upon the Mare, whom before he loathed. Again, it must be regarded, that the Stallion be tyed and bound fait, fo that he may not cover the Mare after the is with foal, hor yet have access unto her, let by kicking and biting he cause abortment, for many times they break their blood sunder, and greatly trouble the semales with young, therefore they are accustomed to some labour, which taketh down the heat of their luft : yet at the time that they are to cover the Mares, you must use all diligence to awaken the droulie nature of the Beast, so that with greater spirit the seed of the male and female may meet together.

The Affes of Lybia will not cover Mares that have manes until they be shorn off, for it seemeth they difdain that their females should have more ornaments then themselves, which are their hus-

We have shewed already in the discourse of the As, that Mares do not willingly admit any bands. Stallion Als to cover them, except it be such a one as did suck a Mare, which we called a Horse, fuckling, or Equimulgus. For this cause men that propound unto themselves to nourish races of Mules, take the Colt of an As fo soon as it is fooled, and put to it a Mare, giving milk in some dark place, wherein the Mare not doubting any fraud, is deceived, and willingly yeeldeth her udders to the Asses foal; whereunto being accustomed for ten days together, at last she taketh it for her own; and such a Stallion As loveth Mares exceedingly; and on the other side, the Mare refuseth not him. And some say, that although they suck their mothers milk, yet if from the time of their weaning they be brought up among Horse-colts, it is as good as if they had sucked

If the Ass be small which is a Stallion, he will quickly wax old, and his iffue be the worse, therefore they must provide the largest and strongest Asses, and nourish them with the best Hayand Barly, that so his strength may abound before his copulation. He oughe not to be under three years old, nor yet brought unto a Mare which never knew Male, for fuch a one will beat him away with her heels and mouth, and bring him into perpetual hatred with that kinde; wherefore they use to bring some vile and vulgar As into the presence of the Mare, as it were to woo her, and provoke her to copulation, that to if the beat him away, it may be no hinderance to the Stallion; but if the feem to admit him, and defirous of copulation, then they take him away, and bring the appointed Stallion into his room, and so the Mule is engendered.

For the effecting of their copulation, there must be a place appointed for the purpose, betwit two walls, having a narrow passage, that so the Mare may not have liberty to fight with the Als, and the Mares head must be tyed down to a Manger or Rack, the ground being so fashioned, that her fore-feet may stand much lower then her hinder, and so ascend backward, to the intent that the Ass may more easily less more her head, and the received the Mare has may more easily less may her head, and the received the Mare has may more easily less may her head. As may more easily leap upon her back, and the receive the feed more deeply. When the Mare hard brought forth the Arich brought for the Arich hath brought forth the Mule, the givethic fuck half a year, and then driveth it away, which ought to be brought up in some Mountains, or hard places, that so the hoofs may grow hard and indurable.

Of the Male.

Having thus discoursed of the generation of Mules, it now followeth, that we should enmaying whether Mules thus engendered betwirt an As and a Mare, do likewife bring forth in their own kinde. Observatum est (faith Pitny) à duobus diversis generibus tertis generit fiert, & neutri parenown kinds. Operation of the nata funty more gigners, in own animalium genera fiert, & neutri parentum territ general fiert, & neutri parentum effe smilley, eaq; ipfd que ita nata funty more gignere, in owni animalium genere, ideito Mulus non parere. That is to fay; It thath been observed, that out of two divers kindes, a third hath parere. been engendered, and yet like to neither of the parents, and those to engendered did not procreate been singularity of Bears, or among all creatures; and therefore Mules conceived beother and Mares, do not bring forth young. Whereupon Camerarius made this pretty riddle of a Mule to be given and to gate the control of 234 6 gas Sl. 1 uic in 12 georgia de la companya del companya del companya de la companya del la companya de la

Confust generie, genert non apra propago, Ex alie noftor, nec quifquam nafcliur ex me.

ar guille of acide. Democitus is of opinion alfo, that Mules cannot conceive, and that their fecret places are not like other Beafts, and the iffue of confused kindes can never engender but especially in a Mule, because it is made of divers feeds, (I mean divers in quantity; and almost contrary) for the feed of the Als is cold, and the fred of the Mare is hot.

Annale diputing of this matter concerning those kindes that are procreated of divers parents writeth in this fors; those Beafts joyn in copulation, whose kindes although they are divers, yet are not their natures very dilagreeable, If the quantity and flature be alike, and the times of going with voung becqual, yet they remain barren that are fo begotten, of which cause Empedotles and Democriout yeeld reason: Empedocles obscurely, and Democritus more plainly, but neither of them both well; for they alledge the same demonstration about all Beasts out of their kinde. Democritus saith, that the passages, of the Mules are corrupted in their wombs, because their beginning doth not conist of one and the same kinde; but this is no reason, for that it happeneth allo to other Beasts that

Empidely he yeelds a reason out of Plutarch, about the joyning rogether of the seeds, and therefore compareth it to a commixtion of Tin and Brass together, but he faith he doth not underfund their meaning, and therefore proceedeth to express his own opinion in these words. First (hithhe) every one of the Males do beget one of their own kinde, but the females cannot concive, and this is no great wonder; because that Horses are not always fit for generation, nor Mars to bring forth Colts being covered and therefore when Affes and Mares do couple togethe, their issue may be more barren, because they receive the greater hinderance in the diverfity of kinde; for besides the coldness of the Asses seed which may be one great cause of his barrenness, they have another property, if they do not breed and engender before the cast-ing of their Colts-teeth, they remain steril and barren all their life long: for so doth the geactive power of the Asses body rest upon a tickle and nice point, apt to rise, or easie to fall sway to nothing.

And in like fort, is a Horse prone to barrenness, for it wanteth nothing but cold substance to be mingled with his feed, which cometh then to pass when the feed of the Ass is mixed with it, for there wanteth but very little, but that the Affes feed waxeth barren in his own kinde, and therefore much more when it meeteth with that which is beside his nature and kinde.

This allo hapneth to Mules, that their bodies grow exceeding great, especially because they have no menstroom purgation, and therefore where there is an annual breeding or procreation, by the help and refreshing of these flowers, they both conceive and nourish; now these being wanting unto Mules, they are the more unfit to procreation.

The exergments of their body in this kinde they purge with their urine, which appeareth because the male Mules never smell to the secrets of the semale, but to their urine, and the residue which is not voided in the urine, turneth to encrease the quantity and greatness of the body; whereby it cometh to pals, that if the female Mule do conceive with foal; yet is the not able to bring it forth to perfection, because those things are dispersed to the nourishment of her own body, which hould be imployed about the nourishment of the foals and for this cause, when the Egyptians deknibe a barren woman, they picture a Mule.

Alexander approdifem writeth thus also of the sterility of Mules. Mules (faith he) feem to be bar, O m. ten, because they consist of Beasts divers in kinde, for the commixtion of seeds, which differ both An Bmblem. in habit and nature, do evermore work fomething contrary to nature, for the abolishing of generation; for as the mingling together of black and white colours doth defroy both the black and white, and produce a wart and brown, and neither of both appear in the brown; fo is it in the generation of the Mules, whereby the habitual and generative power of nature is utterly destroyed in the created compound, which before was eminent in both kinder, fimple and feveral. These things

Alemen, as he is related by Plutarob, faith, that the male Mules are barren by reason of the thinness and coldness of their feed, and the females because their wombs are shut up, and the veins that hould carry in the feed, and expel out the menstruous purgation, are utterly stopt. And Empedocles and Diecles fay, that the womb is low, narrow, and the passages crooked that lead into it, and that therefore, and the therefore the same of the military that therefore they cannot receive feed, or conceive with young! whereunto I do also willingly

yerld, because it hath been often found that women have been barren for the same cause. To conyes)a, pecause it used been often found that in some particular Nations if it be natural, or clude therefore, Mules hear very seldom, and that in some particular Nations if it be natural, or elle their Colts are prodigious, and accounted monfters. 5 (25 dist) 39 at 10000

Concerning their natural birth, in hot regions where the exterior heat doth temper the coldina of the Alles feed, there they may bring forth. And therefore Colland and Varra fay, that in many of the rolles feed, the Colts of Mules are as familiar and common, as the Colts of Mares are in any

Mules engene der.

A History of

So then by this teasonit is probable unto me, that Mules may ingender in all Hob Countries, as there was a Mule did engender often at Rome; or else there is fome other cause why they do engenter was a Mule did engender often at Rome; or else there is fome other cause why they do engenter was a Mule did engender often a Africk, and it may be that the African Mules are like to the Syrian Mules before spoken of, der in Ajrice, and it may be that the 22 hour state and are salled Mules fon Eefemblance, and not for that is, they are a special kinde by themselves, and are salled Mules fon Eefemblance, and not for nature. It hath been feen that a Mule bath brought forth twins, but it was held a prodigy. Henature. It nath been teen that a street two ftories of a Mules procreation; When Darius (faith rodotus in his fourth Book recorded these two stories of a Mules procreation; When Darius (faith rodoins in the fourth book recorded there was horizon, and getting up to the top of their Towers, he) belieged Babylon, the Babylonians (corned his Army, and getting up to the top of their Towers, did pipe and dance in the prefence of the Persians, and also utter very violent & opprobatous speeches against Parise and the whole Army, amongst whom one of the Babylanians said this is Quid ific de Sucritic of Berse? quin positive absceditie, tune expugnaturi nos cum pepererini Malan O ye Persium, why do you fit here? wisdom would teach you to depart away; for when Mules bring forth young ones, then nt nere? wildom would teach you to uspatt away; lot which the strong that the Philint should may you overcome the Babylonians, Thus spake the Babylonians, believen that the Philint should may you overcome them, because of the common proverb, epean emional relegion. When it will be the the young ones. But the poor man spake truer then he was aware of, for this followed after a yeer and leven months: While the flege yet lasted, it hapned that certain Mules belonging to Zipha, the for of, Megabians brought forth young ones, whereat their Master was much moved, while he remembred the aforesaid fong of the Babylonian, and that therefore he might be made the Author of that fact, communicated the matter with Darius, who profently entertained the device; therefore Zopi-THE CULT Off his own note and cars, and fo ran away to the Babyloniani, telling them that Divini had thus used him, because he perswaded him to depart with his whole Army from Babylon, which (he said) was in expugnable and invincible. The Bablonians feeling his wounds, and truffing to their own firength, did eafily give credence unto him ; for such is the nature of men, that the best way to beguile them is, to tell them of those things they most defire, for so are they hopes persuaded, before they receive any affurances. But to proceed, Zopirus infinuated himself further into the favour of the Babylenians, and did many valiant acts against the Persians, whereby he got so much credit, that at last he was made the General of the whole Army, and so betrayed the City unto the hade of Deriar : Thus was Babylon taken when Mules brought; forth:

Another Mule brought forth a young one at what time Xerxes passed over Helleson; to go against Gracia, with his innumerable Troops of Souldiers, and the said Mule so brought forth, had the genitals both of the male and female. 111 118

Unto this I may adde another flory out of Suetonine, in the life of Galba Cefar. As his father was procuring Augurisms or divinations, an Eagle came and took the bowels out of his hands, and carryed them into a fruit-bearing-oak, he enquiring what the meaning of that should be, received answer, that his posterity should be Emperours, but it would be very long first whereunto he merrily replyed; Sane cum Mula peparerit; I fir, when a Mule brings forth young ones: which thing afterwards happened unto Galba; for by the birth of a Mule, he was confirmed in his enterprises when he attempted the Empire; so that, that thing which was a prodigy and cause of forrow, and a wonder to all other people, was unto him an ominous confirmation of joy and gladnes, when he remembred his Grand-fathers Sacrifice and saying. Therefore it was not il said of Democritus; Mule non nature opus, sed humane machinationis; adulterinum inventam; o fatta effe videntur. Mules are not the proper work of nature, but an adulterous invention of humane The invention policy, robbing nature : for (faith he) when a certain Median found : his Afs covering of his Mire, whereupon afterwards the fell to be with foal, and feeing the young one to communicate with both natures, they drew it into a cultom to cover the Mares with their Affes, for the engendering

Some are of opinion that Mules first began among the Paphlagonians, which before the Injan war were called Eneit, and afterwards Venett: but in Gen. 36, we finds that And the 18h of Ziben, lieve, that while Assand Horses ran wilde in the Wilderness among themselves, the wilde Assand Horses ran wilde in the Wilderness among themselves, the wilderness among themselves, the wilderness among themselves the same themselves among themselves the same the same themselves the same the s first began this race. The male at seven years old may engender, because he is of a hotte nature then the female, and alfo doth not in his generation confer any part of his bodily growth to the young one, and fometimes he engendereth when he hath loft his foremost edeth, and after the fift copulation, he never engendereth when he hath loft his foremost edeth, and after the fifth copility on, he never engendereth more. The young one so generated, is called Ginaus and Panillo, for it is very dwarf, according to the observation of Martial:

Aristotle. The quantity of a Mulcs

Ælianus.

His tibi de Mulis non est metuenda tuina, Altime in terrie pene sedere foles.

Such as these were kept in the Court of the Duke of Ferraria, and although in all things they resemble the mother, yet are named after the father, and such also are the Burdones before spoken of in the story of the Horfs. Mules are begotten both by Mares, She-affes, and Bulls, but yet of in the mary of the begotten betwirt an Afs and a Mare. And thus much for the generation of

They are nourished with the same meat that Horses and Asses are, annoyed with the same sicknelles, and cured with the fame means; generally bloud-letting is good for them, and for their diet Bullimung. In Southis they can abide no sold, and therefore the Horses are there used in stead of Mules, Infome Countries the Horfes can abide mo cold, but the Affes and Mules bear out (as Herodust writtenby, and as we have hawed before in the flory of the As : when the Gracians were at data with white destroyed by a consuming pestilence, the first of all their company that dyed were their Dogs and their Mules, and the reason of it was, because the pestilence arising out of the earth, they by the fense of smelling, which is very quick in both kindes, did first of all draw in that povfon from the earth.

on noments faith, that the medicines for the Oxen do also cure Mules, yet there are special medi- Sicknesses of cines not to be neglected, which we will express in this place. For a Mule that hath a Feaver, give Mules and her raw Cabbage; and for one that is short-winded use bloud-letting, and for a drink give it a pinte their cures. of Wine and Oyl mixed with half an ounce of Frankincense, and half a pinte of the juvce of Horehound. For the scratches or disease in the hoofs, lay to it Barley meal, then make suppuration with a knife, and cure it by laying two linnen clothes, or by a pinte of the best Garum, and a pound of Ovl infused into the left nostril of the Mule, whereunto you may adde, the whites of three or four Eas separated from the yolks.

The female Mule may be burned in the feet, or let bloud after the manner of Horfes, and fome Countreymen give in their food the herb Vertetrum, or elfe the feed of Hyofosmus of Hen-bane beaten to powder and drunk in Wine. For the languishing of the chine or learness, they make this drink; have an ounce of beaten Brimftone, a raw Eg, a penny weight of the powder of Myrrh, mingled all three together in Wine, and so poured down the Mules throat, is a present remedy to cure it. As also for the pain in the belly and all manner of coughe, the horb Medica is special good for the faid languishing disease. So also to far the Mule if it be given green, and not dryed like Hay,

a little at a time for fear the Beaft be fufforated with overmuch bloud. T When a Mule is tired Collumella. or heared, let the load be taken off, and turn her forth to wallow in some convenient place. If that Ruilm. sufficency, take some fat, and put it into her chaps, that so the may suck it down, and pour Wine after it. bagen in Callering . Listen See

for to kee fithe necks of Mules from wringing and loofening their skin, ute this medicine, Take.
two pound of Hogs-greate look three times, or, thito the third partitwo pinter of Vinegar, and therewithill anoint, the Mules neck. As we have showed that the pains of a Horses belly and guts are bost Pelatonia of all cared by the fight of a Mallard, fwimming in the water, whoseby they are speedily delivered from all manner of torment, lotthe fame hath as great or greater operation to were whe pains of the Mulesbelly. It is reported by Avicen, that Mules fall into madness, and in that madness but their mahe mortally. They are likewife subject to the Gour, and especially to swellings about the Grown of their patterns, but they are cured as Horfes and Oxen.

They live long, ordinarily to fifty years, and fometimes to fourfcore, the reason thereof is given by Celus: Animalia que frequenter porunt brevieris funt vite, inde fit, ut Mult equos superent, endendi dinturnutue; that is to fay, Those Beatte and creatures which oftentimes joyn in copulation have but thort

lives, and from thence it cometh, that Mules live longer then Horles. The Epithets of a Mulc are thirle; pack-bearer, duty, Spanile, rough, and bi-forened. There is The Epithets an Adage or proverb called Mulc Marianus, and by it is fignified a men which is byte both for to obey and conditions and to rule, it was taken from Moster the great Roman Souldier and Commander; whole fathion of Mules. was, when he had commanded any of his Souldiers to fetch & burden, or do any wilde fervice, the himself would put his hand mith it. It fightfieth properly a bearing back, or Colt-Raffe, as we lay in English, whereupon poor men carry their burdens, and from thence at was translated into a proverd, to figurific all, that do obey commands. There be some which give another reason of this proverb, for they fay, that when Scipie did befrege Namamin, he did not only determin to look into the weapons of his Souldiers, but salfo to his Horfes, Mules, and Chariots. Then Marine brought forthen Horfe, nontified by himself wary delicately: Belides the Horfe a Mule of very comely body, far excelling all other Mules both the gentleness and in strength. Therefore seeing about Emperor was delighted with the Beath of identity and would now and then make mention of the Mule, at length it cameithe of dommon fell, to delt a double diligent separa Mulus Mari-The helique do comments weal those men Mules which are base born, and not by lawful maintenance of the delication of the control of the control of the second for well to

Concerning the disposition basMules, it is well observed by Artfule, that Mules are always Alumnu. tame; and if at any time should more wide; shey shate their unreameable seame; by drinking of. The inward Wise because by the operation of the Wine, their hedle and inted parts done fore and grow fore, by disposition of the fame reafon that Aped by drinking of Wine bole their nalls, and men aventomed to dranken. Mules. nels fallinto palfies: for there is such a dispersing and discussing nature in Wine, that it dissolvesh all nerves and hard things in the bodies of Bonks; each as water dissolvesh hard fruits and peace at the property of the bodies of Bonks; each as water dissolvesh hard fruits and peace at the peace at Peafe, and Vinegar maketh lead as foft as an Egge, that it may be drawn through a Ring: and fuch is the nature of Mulses, that after they have drain! Wine, they feel titlemic lives differenced, and their sizes. tote give over to refilt, baceute by kicking backwards, they receive more has their gives

and thus the guiltiness of their own weakness, maketh them gentle against their wills, for otherwise and thus the guittines of their own weathers, the trackable as Horses. For Varie faith, that they have they nate maname, and are morning to them alone, they kill Wolves when they come among fo much confidence in their heels, that by them alone, they kill Wolves when they come among

Curdan.

Mules were wont to be used for plowing, and for carrying both of men and burthens; but now the of Mules were wont to be used to proving, and then they in their feveral in most parts of Europe, Judges and great Princes ride upon them until they be old, and then they in mon parts or narge, Junges and great rimes the Mountains where they suffer them to run wilde, fell them to the poor men, who turn them into the Mountains where they suffer them to run wilde, till their hoofs be hardned for long travails, and then they take them up again. They have been alfo accustomed to ploughing, according to these verses;

Quantum mulatum sulcus pracedit in arvo. Tantum is pracurrii.-

For the Mules did plough more speedily, and come to the lands end more quickly then either the Ox or Horse. And Martial faith, that they were used in Carts to draw Timber, according to these verses:

Viza; datur longas Mulorum vincere mandras, Queq; trabi multo matmora funo vides.

They were also used in race at the games of Olympus, as we have already shewed in the flory of the Horse, but that custom dyed quickly, because that the Arcadians could not endure Mules. The price of Mules was great, for Criffine (laith Juvenul) gave fix thouland pieces of mony for a Mule, and yet he faith it was not well worth fix pound; the verses of Juvenal are these:

—Crispinus Mulum sex millibus emit Æquantem fane paribus feftettla librie, Ut perhihent qui de magnie majora loquuntur.

The Cappadocians payed to the Persians every year besides Silver and Gold, fifteen hundred Horses, two thousand Mules, and fifty thousand Sheep; but the Medians payed twice so much. The dwarfish Mules called Ginni were also much set by, not for use, but only for delight, as dwarf are kept in Noblemens houses. When Positirate the son of Hipporrates first of all affected Tyranny at Albert, and laboured to get the government to himself, as he came out of his Countrey, being drawn with a Chariot by Mules, he wounded himfelf and his Mules very grievoully, and to drave them into the Market place, shewing his wounded body and Beasts unto the Athenians, telling them that is he was wounded by his enemies, and that he escaped death very narrowly; but if it pleased them to grant him a gard of fouldiers to defend his body, he would take revenge upon their and his enemies: whereunto they yeelded, and he having gotten a Band of Souldiers under that presence; presently took upon him the government and Soveraignty.

To conclude this story of Mules, I do read in Ælianus, that Serpents do love to feed on the fieth of dead Mules; and two things are very eminent in the nature of Mules, one of their underslanding, and the other of their friendship. Concerning the first, Plutarch relateth this story of a Mule that was accustomed to carry Salt, who upon a season going through a water; fell down underseath his burden, fo that the Salt took wet afterwards ; the Beaft perceived how by that means, his tratream load melted away, and fo became lighter and lighter; afterward the Mule grew to this tuftom, that whenfoever he came loaded with Salt over that water, he fell down in it for the ealing of his carriage; his Master perceiving his craft, on a day he loaded him with Wool; and Spunges, and fo the Beaft coming over the water, fell down as he was wont to do with his Salt, and coming out of the water, he felt his load to grow heavier then it was wont to do, in flead of leffening, whereat the Beaft much mufed, and therefore neves afterward durft lie down in the water, for fear of the like increase of his load. The other observation of their love and friendship, ariseth from the Proverb, Muluum Muli stabunt, that is, Mules scratch one another, and help one another in thereis tremity; from whence cometh our proverb, On good turn asketh another; and the Lamepro verb, Senes mutuum fricent, old men rub one another; which did arise upon this occasion is a faith the Emperour fo passed a long on a day by a bath, he law an old Souldier in the bath rubbing him. felf upon a Marble ftone for want of a man to help him, whereupon in pity of his rafe he gave him maintenance for himself and a man: afterwards other old Souldiers seeing how well their sellow had fped, went likewise into the bath before the Emperors eyes wand rubbed themselve upon the Marble, thinking to get as much favour and liberty at their fellow had gotten, but the Emperor feeing them, and perceiving their fetches, bid them rub one another, and thereupon came that proverb. And thus much for the natural discourse of Mules, now followeth the meditanali Paufics : . . . et er tot. ្រ ស្រាស់ ខេត្ត ខ្លួនដែរថា 🕒

The Medicines of the Mule.

The dust wherein a Mule shall turn or rowl himself, being gathered up and spread or sprinkled upon the body of any one who is ardently and fervently in love, will prefently affwage and quench

his inflaming defire. A man or woman being poyfoned, and put into the belly of a Mule or Camel which is new killed, will presently expel away the force of the venom or poyson, and will con- Ponzettus. firm and make strong their decayed spirits, and all the rest of their members: For as much as the very heat of those Beasts is an Antidote or preservative against poyson.

The skin or hide of a Mule being put unto places in any ones body which are burned with fire. doth presently heal and cure the same: it doth also heal fores and grievous ulcers which are not come

unto Impoltumes.

The same is an excellent remedy for those whose feet are worn or wrung together through the Avicennal pinching of their shoos, to help themselves withall, and for those which are lame, and those which are troubled with those grievous fores called Fistulaes. If any man shall take either in meat or drink the marrow of a Mule, to the weight or quantity of three golden crowns, he shall presently become blockish and altogether unexpert of wisdom and understanding, and shall be void of all good nutriment, and manners. The ear-laps or ear-lages of a Mule, and the stones of a Mulet be- Albertus. and normalists. The earliages of a Mule, and the tones of a Mule bet Albertus, ing born and carried by any woman, are of fuch great force and efficacy, that they will make her Ejculapius, not to conceive. The heart of a Mule being dryed and mingled with Wine, and so given to a wo- Sextus, man to drink after that the is purged or cleaned thirty times, hath the same force and power that the aforesaid medicine hath for the making of a woman barren. The same effect against conception hath the bark of a white poplar tree, being beaten together with the reins of a Mule, then mingled in Wine, and afterwards drunk up. If the herb called Harts-tongue, be tied upon any part of Avicenne a woman, with the spleen of a Mule, but as some have affirmed by it self only, and that in the day which bath a dark night, or without any Moonshine at all, it will make her altogether barren and not ableto conceive. If the two stones of a Mule be bound in a piece of the skin of the same Beast Albertus. and hanged upon any woman, they will make that she shall not conceive so long as they shall be bound unto her. The left stone of a Weefil being bound in the skin or hide of a Mule, and steeped or foked for a certain space or time in Wine, or in any other drink, and the drink in which they are so steeped given to a woman to drink, doth surely make that she shall not conceive. The stones of Esculpius. a Mulet being burned upon a barren and unfruitful tree, and put out, or quenched with the stale or urine of either Man or Beaft which is gelded, being bound and tyed in the skin of a Mule, and hanged upon the arm of any woman after her menstruat fluxes, will altogether refist and hinder her conception. The right stone of a Mule being burned and fastned unto the arm of a woman which is Sextus. in great pain and travail, will make that the shall never be delivered until the same be loosened and uken away, but if it shall happen that a Maid or young Virgin shall take this in drink after her inthrugation or menfes, the thall never be able to conceive, but shall be always barren and un-

The matrix or womb of a female Mule taken and boiled with the flesh of an As or any other Rasis. Ach what loever, and so eaten by a woman which doth not know what it is, will cause her never to conceve after the same. The worm which is called a Gloworm, or a Globird, being taken out of Kiranides, the womb or matrice of a female Mule, and bound unto any part of a womans body, will make that the shall never be to able conceive.

The duft or powder which proceedeth from the hoofs of a male or female Mule, being mixed or plint. mingled with Oyl which cometh from Myrtleberries, doth very much help those which are troubled with the Gout in their legs or feet. The dust of the hoofs of a Mule being scorched or burned, and the Marcellus. Oyl of Myrtle-berries being mingled with Vinegar, and moilt or liquid Pitch, and wrought or tempered in the form or fashion of a plaister, and opposed or put unto the head of any one whose hairs are too fluent and abundant, doth very speedily and effectually expel the same.

The liver of a Mule being burned or dryed unto dust, and mixed with the same Oyl of Myrtle-berries, and lo anointed or spread upon the head, is an excellent and profitable remedy for the curing of the aforefaid enormity. Dr. Orthe, Level th .

The duft or powder of the hoofs of a female. Mule is very wholesome and medicinable for the Sextue. healing and curing of all grieft and pains which do happen or come unto a mans yard, being sprinkled thereupon. The hoos of a Mule being born by a woman which is with childe, doth hinder her conception. The filth of uncleanness which is in the ears of a Mule, being bound in the skin or hide of a little or young Hart, and bound or hanged upon the arm of a woman after her purgation, doth cause that she may not conceive. The same being in like manner mingled or mixed with Oyl which is made of Beavers-frones, doth make any woman to whom it is given to drink, altogether barren. The dit or dung of a Mule being mixed with a Tyrup made of Hony, Vinegar, and Water, and given Marcellus. to any one to drink that is troubled with the bear of welling, will very speedily and effectually cure the pain thereof.

The dung of a Mule being burned or dryed and beaten finally and afterwards fifted, or feired and wifted or fleeped in Winewand given to any woman to drink, whole mentitrual fluxes come forth beforether, time, will in very thore space outse the same workay. The state or urine of a male or Hippocrates. female Mule being mingled with their directeding; fisvery good and medicinable for those to use which are troubled with their directeding; fisvery good and medicinable for those to use which are troubled with corns and hard bunches of fish which grow in their feet. All finds being minuted to the state of the state o mingled with the urine of a Mule to the quantity of a bean, dad drunk, will altogether be an impediment with the urine of a Mule to the quantity of a bean, dad drunk, will altogether be an impediment with the urine of a Mule to the quantity of a bean, dad drunk, will altogether be an impediment with the urine of a Mule to the quantity of a bean, dad drunk, will altogether be an impediment of the urine of diment and hinderance to the conception of any woman. The fisher urine of a Mule being taken Rafit. to the quantity of eight pounds, with two pounds of the fluid or refuge of fliver, and a pound of old and most clear Oyl, all these being beaten or pounded together until they come to the thick-

out or iweiling in the joynts.
If a woman shall take the sweat which proceedeth from a Horse, and anoint it upon a Woollen Gout or swelling in the joynts. it a woman man take the tweat which profitory unto her fecret parts, it will make her aftogether cloth, and so apply it as a plaister or suppository unto her fecret parts, it will make her aftogether barren. There is an excellent remedy for those which are pursie or thore winded, which comethat fo by the Mule: which is this; To take or gather the froath or fome of a Mule, and to put it into

to by the Mule: which is this; to take or gather the trouble or time to be drunk, either to the a cup or goblet, and give it in warm water, for a certain space or time to be drunk, either to the a cup or goblet, and give it in warm water, for a certain space or make he desired to the man or woman which is troubled with this enormity, and the party which do fo use it, shall in short man or woman which is crousled with this end any lingring of time, or confuming of time in pain space have remedy; but the Mule will without any lingring of time, or consuming of time in pain

to for the mile of a male or female Mule, being drunk in a potion or juyce made of Hony, Water, and Vinegar, to the value or quantity of three cruces or cups full, is commended for an excellent ture Vinegar, to the value or quantity of three craces of caps tons, and deadly different and medicine, for those which are troubled and grieved with that pettiferous and deadly different. and medicine, for those which are stone Bril. There is an excellent remedy for those which are troubled in the voiding of their water, which is this; To take the Ring-worms of Teners which do grow upon both the legs of a Mule above their knees, and which do stock thereupon lathe which do grow upon both the legs of a water parch them, and afterwards to put or place them upon manner of a dryed thick skin, and to burn or parch them, and afterwards to put or place them upon manner of a cryeci trick skin, and to burn of pater tricks, and after but by drops-mest, to that there him which is troubled with the Strangury, or cannot void his water but by drops-mest, to that there him which is troubled with the Strangury, of calificed cloaths, or garments; the influmigation there be great care had to cover close with cloven or clefted cloaths, or garments; the influmigation there of, lest that the smell or sume do sade, and void away, and this being so used will be very entered for the curing and driving away of the aforefaid diffale

Trallianus.

or the curing and uriving away of the alore and allowed and dryed, and put into Tobic certain pertine nairs of a mule and an Ale Being minighes to getter and type, and to given to any one to drink which is troubled with the Falling fickness, will prefently fume, and to given to any one to drink which is troubled with the Falling fickness, will prefently fume, and to given to any one to drink which is troubled with the Falling fickness, will prefently fume. exper and unive it quite away. An enter will prefently arife, and grow small pulled, or little Mule shall bite, Ponzetta affirmeth, there will presently arise, and grow imali pushes, or little blisters which are always full of red and pale humors, and flishy corruption, which tai simol be healed and cured by no salve, potion, or medicine, by any means applyed thereund. There are some also which do suppose the biting of Mules to be poysion, for truly there doth intronly solome also which do suppose the biting of Mules to be poysion, for truly there doth intronly solow those aforesaid pushes and biles, but also an extrem and almost indurable inflammation and burning, through all the parts of the body, which doth greatly diffemperate indiversible

But it is affirmed by others, thatithe biting of Mules is to be cured after the fame manner as the biting of a Cat, which is thus: First, to wash and clarifie the wound or bitings where the corruption is with Vinegar mingled with Oyl of Rofes, and then to take Peny-royal, of the herb ruption is with a line and froke or rub the wound very foftly with it, and it will in the called Neppe, and boil it, and froke or rub the wound very foftly with it, and it will in the wholly cure it. And thus much shall suffice at this time concerning the cures and medicine of The state of the s bullactor her and according Mules.

Of the Neades, Neides, or Naides, beneau vol to O de rode, as

Eraclides, Calim, Volaterranm, and Euphorlon, do all/write that once the Alle of Same was Defert place, and that there were in it certain Beafts called Medden, whose voyce was friend ble that they shook the earth therewith, and from those drange and great voyces traine the sul-gar Greek proverb, Meizoon mis toon Newtoon, mains une Neudum. Thus is, One of the Newte and a great wonder, for it was used in oftentation, to thew that there was nothing in the whole world tout parable to their vaft and huge quantity. Of the parts of these Beafts there is no memory but only in Suidu and Elianus, who affirm, that their bonts were to be feen in their days. And this title I thought good to infert into this Hiftory, leaving the Resider to confider; whether he will take them for Elephants, or for any other greater Beaft; for my opidion if it be defied, I chick them Hitter (f there ever were any fuch) that they were Biephants of gotater flature then ever line were list, and not any generation of Beatts now loft and utterly petithed to a read but a real among to the the continue may and conceive. The cane being a street are a conceived by the marken beauty and conceived the cane being a street as a street and beauty a

The names of this Beaft.

on of D. Cay.

There is in Italy a Beaft called Alphte, which many in Italy, France, and Comments and Branch and to be the fame Beaft which in called Leadners, and Anderson make the Luthness of their fame and the last which in called Leadners, and for the description of te, of their following that the Author then Description of the description of the description of the state of the last the la

Author then Doctor Cays, who describes humbins festion many and the poly who describes humbins festion many the Doctor (sith he) is a most cruel Beast, of the quantity of a village or matter to the describes the his face and ears like roa Lions, his body, tail; feet, and nails like a Cata, of a very telricit King, his teeth fo ftrong and tharp, that he can even cut Wood in funder with them; he had all finds nails fo great ftrench. The descriptinails fo, great firength, that he only fighteth with them, and with them for his greateful lent; in the color of the upper parts of his body being like whitish Pak, the lower being drift body of

of after, being every where mixed with a black and frequent foot, but the tail more black then the of after, being every where mixed with a greater spotthen the refidue. His care within are refive in body, and as it were obscured with a greater spotthen the residue. His care within are rate without any paleness, if you do but take away one bark and yellow spot in the midst thereof, which is made of a double skin rising, meeting in the top of the ear, that is to say, that which arisets from the outward part of the jaw on the one side, and cometh from the upper part of the head on the other fide, and the same may be easily seen and separated in the head being dryed. a heading any against a street

Therest of the head is spotted all over with a most frequent and black spot, (as the rest of the body) except in that part which is betwirt the note and the eyes, wherein the eare none, unless only two, and they very final! eyen as all the reft are lefter then the reft, in the extream and lowest parts: the spots which are in the upper parts of the thighs, and in the tail, are blacker and more singular, but framed in the stock with such an order, as if all the spots should seem to be made of four. There is no order in the spots, except in the upper lip, where there are five rows

In the first and uppermost two which are severed; in the second, fix, being joyned in that manarr, asif they thould feem to be in one line: Thefe two orders are free, and not mingled amongst themselves. In the the third order there are eight joyned together, but with the fourth where it endeth, they are mixed together. The fourth and fifth in their beginning (which they have to the note) being separated with a very little difference, do forthwith joyn themselves, and run together through all the upper lip, and do not make a sporthrough all the same, but a broad line. In the Beat being dead the spots do so stand, (as I suppose) for the contraction of the skin. In the Beat beingalive, those spots do seem separated every one in their own orders. In the very middle between the lower lip, although they do keep the quantity, do not observe the order. The nose is blackish, a line being softly led through the length, and only through the top of the outside thereof. The eyes are gray, the former teeth are only fix, not very unlike to mens teeth, except those which are, placed in the middle are leffer, and they in the uttermost part are greater, as also higher then those which are low.

In this Beaft the teeth are both great, tharp, and long, being joyned to the rest in the lower jaw and in the upper severed with so great space, that the lower teeth may be received therein. These when the Beast liveth are covered with his lips, but when he is dead they are otherwise, his lips being through driness thrunk together. His fore-teeth are very big, and as long as two Roman fingers, for at the very root thereof it cannot be comprehended in less then two Roman fingers and a half compais. In his tooth there is a certain small hollowness through all the length thereof, which notwithstanding doth not appear except the tooth be broken. The lower jay is very hard and stiffe having three teeth unequal in quantity, as the upper four, Between the great tooth and the first check tooth of the under jaw, there is a void space to the quantity of one finger, from which the firth is presently placed, lesser then the other two: to this there is another greater close adjoyning: and after this there is also a third greater then the second. In the upper jaw in that middle space (which I said was of one Roman singer) between the great tooth, and the first cheek-tooth, there is a very little tooth, and without any form, coming so imally, out of the jaw, that there is no lower tooth which may answer to the same. After that, in the space of half a finger there is a second, to which there is joyn'd a third, and after this a south, between themselves the upper and the lower cheek-teeth, and so are joyned together as they agree in the manner of a comb; the two first teeth is the same of the same that the same that the same the first teeth in the lower jaw, and the second and third in the upper jaw are of the same figure, as the compass of the tops of the Crowns of the Kings of England and France. The third is of the Ame figure in the lower jaw, and the fourth of the upper jaw, except that the interior side of both the

gums which is nearer to the throat, by nature is taken away. There was no other tech joyned to these in both the jaws. But I do not know whether there be any more teeth in the gum beyond the reach of ones finger, in the farthest row or behinde the teeth. But this I know. gum beyong the reach of ones in get, and it may be that his lips were rut or flit down The mest and beyond nature to shew his teeth. "It liveth of slesh, and the semale is more cruel then the male, beyong nature to mew his teetin. It is to be a surface of Mauritania into England in a Ship, for they though leffer, and one of either fex was brought out of Mauritania into England in a Ship, for they are bred in Lybia. If they have any appointed time of copulation, it is near the month of June. for in that month the male covereth the female. We have shewed already that Lions may be tamed and that also hath been manifest in London, both in the Tower and in the City, for there the Lions did play with their Keepers, and kis them without harm, (as Doctor Cay faith he faw them ons did play with their Neepers, and wilde as they could never be tamed, for when foever their do) but these Beasts were so stere and wilde as they could never be tamed, for when soever their Keeper should change or remove them from place to place, he was constrained first of all to strike keeper mound change of tempor the head, that they should lie half dead, and so put them in a fack or wooden cheft made of purpose with holes in it for respiration and expiration, to carry them to and wooden chert made of purpose with after an hour they revived again like a Cat, but when they were fro from one lodging to another it after an hour they revived again like a Cat, but when they were to be taken out of the hutch or cheft, he was conftrained likewife to attonish them again with his to be taken out of the nuteri or then, he was contained but the Beaft in, and take him out of the club; but afterwards they grew to invent an Engine to put the Beaft in, and take him out of the hutch with a rope or cord, and so do remove them from place to place. The Keepers affirmed, that they did feem much to distant the kions, and oftentimes endevoured to fight with them, but they were kept afunder with grates : they would not hurt a little Dog when he was put to then but when were kept anunder with grates: they would not have a them, they tore him in piecess although their they were hungry; but if a great Dog were put unto them, they tore him in piecess although their bellies were never fo full. When they are angry, they utter a voyce like an angry Dog, but they double the (Arr) twice, and also bigger then any Dogs, proceeding out of a large break and wide arteries, much like to the howling of a great Mastive, that is shut up in a close room alone against his will. Some fay it is longer then a Dog, but it did not fo appear in England, for we had many Mastive Dogs as long as it, but yet was it every way greater then any other kinde of Dogs. It is but a vain report, that some have said, when a Man or Beast is bitten with an Ounce, presently Mice flock unto him, and poyfon him with their urine.

For it was seen in England, that two of the Keepers were wounded and shrewdly bitten by one of the Ounces, and there followed them no other harm then that which followeth the buing of an ordinary Dog, or like a small incission with a knife. 'He' never fighteth but at the head, and that treacheroully, if he perceive his adversary to be too strong or too great for him, and that by counterfeiting quietness, benevolence and peace, as if he meant no harm: for fo he served a great Malive Dog in England, at the first fight he feemed to applaud his comming, looking cheerfully upon him, and wagging his tail, prefently he fell down on his belly, as it were to invite the Dog to come near him by his submission; lastly, he got close unto him, creeping as though he would play with him, putting out one of his feet, as Cats do when they play, wherewithal the great Dog grew secure, and began nothing to mistrust the Beast, at length when the Ounce saw his opportunity, he suddenly saped upon his neck, and took him by the throat, and pulled it out, after he had killed him, with his nails he opened the Dogs breaft, and taking out his heart, did eat it before all the people in most cruel manner; thus far Doctor Cay speaketh of the Ounce, and beside him no other Author that I know.

The gall of this Beaft is deadly poylon, it hateth all creatures, and destroyeth them, especially men; and therefore it may well be said to be possessed with some evill spirit. It loveth none but his own kinde. And thus much for the Ounce.

Of the ORYX.

"His Beaft in Pliny and Opplanus is called Orynx and Oryx, and my conjecture is, that his name is derived from Oryffein which fignifieth to dig. Saint Jerom and the Septuagints for Thee, Deut.

14. and Isa. 91. translate Oryx: but David Kimbi, and the better learned men interpret it a wilde Ox. But the Hebrew Difchon may in my opinion be fo translated, yet herein I refer it to the learned

It is certain, that it is of the kinde of wilde Goats by the description of it, differing in nothing but this, that the hair groweth averfe, not like other Beafts, falling backward to his hinder parts, but for ward toward his head, and so also it is affirmed of the Æibiopian Bull, which some sayis the Rhinocerot. They are bred both in Lybia and Egyf, and either of both Countries yeeldeth testimony of their rare and proper qualities. In quantity it refembleth a Roe, having a beard under his chin. His colour white or pale like milk, his mouth black, and fome spots upon his cheeks, his back-bone reaching to his head, being double, broad, and fat; his horns standing upright, black, and fo sharp, that they cannot be blunted against brass or iron, but pierce through it readily.

Arifotle and Pliny were of opinion, that this Beaft was Bifulcus and Unicornie, that is, clovenfooted, and with one horn: The original of their opinion, came from the wilde-one-horned-goal, whereof Sobnebergerus a late Writer writeth thus : Certum est minincque dubium in Carpathomome, with fas Ruffiam Transstvaniama, reperiri ferat similes omnino rupicapris, excepto quod unicum corm ex milit fronte enescitur , nigrum, dorfo inflexum, simile omnino rupicoprarum cornibus , that is to say; It is with

out all controversie, that there are wilde Beasts in the Mountain Carpathus, towards Russia and Out any your like to, wilde Goats, except, that they have but one horn growing out of the middle of their heads, which is black and bending backward like the horns of wilde Goats. But the true Oryx is described before out of Oppianu, and it differeth from that of Pliny, both in stature and horris. Allanne laith, ishat the Oryx hath four horns; but he speaketh of the Indian Oryx. whereof there are some yearly presented to their King, and it may be both there and elsewhere, diversity of regions do breed diversity of stature, colour, hair, and horns. Simeon Sethi affirment of the

Of the Orva.

may be of that kinds. The value of the state were made infituments of mulick out of them i inchabare Cicherns or Lutes, upon whose bellies the Mulitians played telien Mulick, by friking them with their hands; and that those Beafts were as great as Oxen ; and all this may be true; not with flanding we have flewed already, that they are as biggs Roes, for Pliny (peaking that by telation, or by fight, it is likely that he had feen a

Musk: 41, that it hath one horn and it is not unlikely that he hath feen fuch an one, and that the Orvx

There be also Sea-beasts called Oryges, and Orea; and there is in Egypt an Oryx, which at the rising of Genis Syrim, or the little Dog is perpetually forrowful : and this canfe the Lybians to mock the Expliant for that they fable, the same day that the little Dog-star rifeth; their Oryx speaketh. But on the contrary themselves acknowledge, that as often as the said Star ariseth with the Sun, all their Goats turn to the East, and look upon it : and this observation of the Goats, is as certain as any rule of the Altronomers. The Lybiani affirm more, that that they do presage great store of rain, and Plutareb. change of weather.

The Egyptians also say, that when the Moon cometh near to the East, they look very intentively upon her, as upon their foveraigh Goddels, and make a great noise, and yet they say they do it not for her love, but for her hate, which appeareth by knocking their legs against the ground, and fastening their eyes upon the earth, like them which are angry at the Moons appearance : And the felf fame thing they do at the rifing of the Sun.

For which cause the ancient Kings had an observer, or one to tell them the time of the day, sitting upon one of these Beasts, whereby very accurately they perceived the Sun rising; and this they didby turning their tail against it, and emptying their bellies; for which cause by an Oryx the Egyp-uess discipher an impure or godless wretch: for seeing that all creatures are nourished by the Sun and Moon, and therefore ought to rejoyce at their appearing, only this filthy wretch disdaineth and

Thereason why they rejoyce at the little Dog-star, is, because their bodies do perceive an evident alteration of the time of the year, that cold weather and rain are over-passed, and that the vapors of thewarm Sun are now descending upon the earth, to clothe it with all manner of green and pleasant

There is another kinde of Oryx which according to Columella, was wont to be impaled among Deer and Harts, the flesh whereof was eaten, and used for the commodity of his Master: This was impatient of cold. It grew till it was four years old, and afterwards through age decreased, and lost

But to return to the Oryx intended, from which we have digressed; their horns whereof we late spake, are not only strong and sharp like the horn of the Unicorn, and the Rhinoceror, but also soid, and not hollow like the horns of Harts. The courage and inward disposition of this Beast, is both fearful, cruel, and valiant; I mean fearful to Men and Beafts, but fearless in it self: For faith my Author; Neg; enim Caun laireaum timet, neg, aprè effervescentem seritatem, neg, tauri mugi-tum resugit, neg, Pantherarum tuistem vocem, neg, ipsius Leonis vebementem rugitum borret, 'neg, item hominum robote movetur, ac fape robustum venatorem occidit: That is to fay; He feareth not the barking of the Dog, nor the foaming wrath of the wilde Boar; he flyeth not the terrible voyce of the Bull, nor yet the mouraful, cry of the Panthers ; not nor the vehement roaring of the Lion himself; and to conclude, he is not moved for all the ftrength of man, but many times killeth the valiantest hunter

When he feeth a Boar, a Lion, or a Bear, presently he bendeth his horns down to the earth, whereby he conformeth and establisheth his head to receive the brunt, standing in that manner until the assult be made: at which time the easily killeth his adversary, for by bending down his head, and setting his horns to receive the Beast, he behaveth himself as skilfully as the Hunter, that receive the a lionupon his spear. For his horns do easily run into the breasts of any wilde Beast, and so piercing them, causeth the bloud to issue, whereat the Beast being moved, forgetteth his combate and falleth to licking up his own bloud, and so he is easily overthrown. When the fight is once begun, there is none of both that may run'away, but standeth it out until one or both of them be flain to the ground, and so their dead bodies are found by wilde and savage men. They fight with all, and kill one another, also they are annoyed with Linces, I mean the greater Linces: of the cruelty of this Beail Martiall made this distichon:

> Matutinarum non ultima prada ferarum Savue Oryx, constat qui mibi morte canum.

Oppianus. Pliny. Albertus.

It is reported of this Beath, that it liveth in perpetual thirft, never drinking by reason that there It is reported of this Beaut, that it invention perpetuals that there is in it a certain bladder of liquor, is no water in those places where it is bred, and that there is in it a certain bladder of liquor, is no water in those places where it is bred, and there is in it a certain bladder of liquor. is no water in those places where it is bled, and sale liveth in the Wildernes, and not-whereof whosoever tasteth, shall never need to drink. This Beast liveth in the Wilderness, and notwhereof wholoever tattetn, man never need to the frength, wrath; and cruelty, yet is he easily withstanding his magnanimous and unrefiftible firength, wrath; and cruelty, yet is he easily withitanding his magnanimous and uniterinting them to take Elephants and taken by fnares and devices of men; for God which hath armed them to take Elephants and tame taken by mares and devices or men; for God winter that above, to tame and destroy all other noisone Lions, bath likewise indued them with knowledge from above, to tame and destroy all other noisone

Concerning the picture of this Beaft, and the lively visage of his exterior or outward parts, I Concerning the picture or this Beart, and the ivery vines of any credible Author, doth give cannot express it, because neither my own fight, nor the writings of any credible Author, doth give cannot express it, because neither my own light, not the world, and succeeding Age upon my me sufficient direction to deliver the shape thereof unto the world, and succeeding Age upon my me sufficient direction to deriver the inspection to the unit of the unit pardon me herein. I do not also read of the use of the field, or any other parts of this Beaff, but only of the horns, as is already expressed, whereunto I may adde or any other parts or this bean, out only a the interpretation of Strabe, who affirmeth the Ethiopian Silli, do use the horns of these Beasts in wars the relation of Strate, who and there in the hardness and tharpness of them, which couled instead of swords and spears: for incredible is the hardness and sharpness of them, which couled Invenal to write thus:

Et Getulm Oryx bebett lautissima ferre

For although of the own length they are not able to match a pike, yet are they fit to be put upon ror actioning of the own length they are included thing made of freel or iron; and thus I will conclude the tops of pikes, as well as any other artificial thing made of freel or iron; and thus I will conclude the story of this Beaft.

The SCITHIAN WOLF.

Of the OTTER. Here is no doubt but this Beaft is of the kinde of Beavers, because it liveth both on the water

and on the land, and the outward form of the parts beareth a similitude of that Beast. The

Italians do vulgarly call this Beaft Lodra, and the Latines befides Lutra, Fluviatilia Ganicula, a Dogof

and Louire; and tome can them one of the vaccin; the Savoyans, Une Leure; the Spaniard, Natria; and the Hyrians, Widra; the Gracians, Lyrra, because it sheareth asunder the roots of the trees

in the banks of the Rivers. Some of the Gracians call it Enhydric, although properly that bea Snake

living in the waters, called by Theodorm, and Hermolam, Lutrie. Albertm calleth it Luter, and Andre

for Enbydrie. Alfo Beatus by Silvation; and the Grecians call filthy and thick waters Lural; for

and the reasons the Waters; and some call them Cats of the Waters; the Italians besides Lodra, call it also Lodra, the reof.

Stephanne. Pliny.

The places of

Hermolaus.

Olaus. The several. which caufe, when their Noble ancient Women went to bathe themselves in water, they were bound about with skins called Oan Loutrida, that is, a Sheeps skin used to the water. The Franch men call the dung of an Otter, Efpranite de loutres; the steps of an Otter, Leife Marcher; the whelps of an Otter, Cheaux, by which word they call also the whelps of Wolves, Foxes, and Badgers. Although they be a kinde of Beaver, as we have faid already, yet they never go into the Sea, and sea almost a land in all blackers. they abound almost in all Nations, where there are Rivers or Fish-pools, as namely in Ball, France, Germany, Helvetia, England, and Scandinavia. Likewise in all Sarmatia, in the Bay of Beryfibenes. They are most plentiful in Italy, where the River Padus is joyned to the Sea. Also they abound in Noglein Italy, where the River Padus is joyned to the Sea. Also they abound in Noglein in Italy, where the River Padus is joyned to the Sea. Their outward form is most like unto a Beaver, saving in their tail, for the tail of a Beaver is fish, but the tail of an Otter is flesh. They are less then Beavers, some compare them unto a Cat, and fome unto a Fox; but I cannot consent unto the Fox. They are bigger then a Cat and longer, but leffer then a Fox, and therefore in my opinion they are well called Dogs of the water. They erceed in length, for in Swella, and all the Northern Rivers they are three times fo long as a Bearer. They have a rough skin; and the hair of it very foft and neat, like the hair of a Beaver, but different in this they have a rough skin; and the hair of it very foft and neat, like the hair of a Beaver, but different in this result is the state of the s rent in this, that it is shorter and unequal, also of colour like a Ches-nut, or brownish, but the BesOf the Otter.

vers is white or afh-colour. It hath very fharp teeth, and is a very biting Beatt, likewife thort legs, vers to write and tail like a Dogs, which caused Bellonius to write, that if his tail were off, he were in all parts like a Beaver, differing in nothing but his habitation. For the Beaver goeth both to the Salt waters, and to the fresh, but the Otter never to the falt.

Although it live in the waters, yet it doth not fuck in water, but air: that is, it doth not breath like fishes through the benefit of water, and therefore it maketh his dens near. The framing the water, wherein also they are wont to of their den. bring forth their young ones: They make their dens fo artificially, even as the Beaver, with bows, and sprigs, or slicks, couching together in excellent order, wherein he sitteth to keep him from wetness. It hunteth fishes, His prey and and although it breatheth like another four-food footed Beaft, yet it will remain a great while under the water without respiration; for the greediness of fishes it runneth many times into nets, which are fet by men in waters to take fish, whereinto being entered, it is suffocated for want of breath, before it can thear afunder the nets and make way for himself to

For in the hunting of fish it must often put his note above the water to take breath: it is of a wonderful swiftness and nimbleness, in taking his prey, and filleth his den fo full of fishes, that he corrupteth the air, or men that take him in his den: and likewise infecteth himself with a pestilent and noisome sayour, whereupon as the Latines say of a stinking fellow, He smels like a Goat; so the Germans say of the same, He smels like an Otter. In the Winter time he comes out of Acricola the caves and waters to hunt upon the land, where finding no other food, he eateth fruits, and the bark of trees. Bellonius writeth Albertus. thus of him, he keepeth in pools and quiet aters & rivers, terrifying the flocks of fish, and driving them to the bank-sides in great number, to the holes and creeks of the earth, where he taketh them more copiously, and more easie: but if he want prey in the waters, then doth he leap upon the land, and eat upon green herbs : he will fwim two miles together against the stream, putting himself to great labour in his hunger, that so when his belly is full, the current of the stream may carry him down again to his defigned lodging.

The females nourish many whelps together at their udders, until they be almost as big as themselves, for whom the hunters fearch, as for the dams among the leaves and boughs, which the over-flowings of waters in the Winter time, have gathered together, and laid on heaps. It is a sharp biting Beaft, hurtful both to men and dogs, never ceasing or loosing hold after he hath laid his mouth upon them, until he make the bones to crack betwixt his teeth, whereup-on it was well faid by Olaus Mig. Lutra mordaces quadrato ore. Otters are most accom-

plished biters.

It is a very crafty and fubtil Beaft, yet it is fometimes tamed, and used in the Northern parts of the world, especially in Scandinavia, to drive the fishes into the Fisher-mens nets:

for so great is the fagacity and sense of smelling in this Beast, that he can directly winder tor to great is the tagacity and territor off, and therefore the Fifners make great advantage the fifners in the waters a mile or two off, and therefore the Fifners make great advantage of them, yet do they forbear his use because he devoureth more then needeth, for he is of them, yet do they fordear his the because it is being tamed, on the land he is very never fo tamed, that he forgetteth his old ravening; being tamed, on the land he is very never to tamed, that he longettern his out came into the Writers heads to affirm, that the Beaver constraineth the Otter in the Winter time, to trouble the water about her tail, to the Beaver constraines the Otter in the Vinice we have consuted already in the discourse of the intent it may not frieze, which opinion we have consuted already in the discourse of the Beaver, for herein I agree with Albertus. Fiber fortior of lutra, & acutifinia dentibus, quapropter cam vel expellit, vel occidit. The Beaver is much stronger then the Otter, having propier eam vet expeliit, vet occulation. The bound is supposed to the waters, because they also most sharp teeth, and therefore either expelleth her out of the waters, because they also most marp teets, and therefore they live both upon one kinde of food, or else destroys her: wherefore it is unreasonable to believe that he preserveth her to keep his tail from friezing. The flesh of this Beast is both cold and filthy, because it feedeth upon stinking fish, and therefore not fit to be eaten. Tragus writeth, that this notwithstanding is dressed to be eaten in many places of Germany, and I hear that the Carthusian Fryers or Monks (whether you will) which are forbidden to touch all manner of flesh, of other four-footed Bealts, yet they are not prohibited the eating of Otters. These Otters are hunted with special Dogs, called Octers are hunted with specia prohibited the eating of Otters. And the eating of Otter-hounds, and also with special instruments called Otter-speares, having exceeding sharp ter-nounds, and and with special instantants and Beafts do not willingly fet upon them, specially points: for they are hardly taken, and Beafts do not willingly fet upon them, specially points: for they are narmy taken, and better to be wounded with the spear, then they come in the waters: when they feel themselves to be wounded with the spear, then they come to land, where they fight with the Dogs very irefully, and except they be first wound. ed, they forfake not the waters: for they are not ignorant how fafea refuge the waters ea, they forfake flot the waters are unto them, and how unequal a combate they shall sustain with Men and Dogs upon the land, yet because the coldwater annoyeth their green wounds, therefore they spin out their lives to the length of the thread, chusing rather to die in torments among Dogs, then to die in the waters. There is a kinde of Affa called Benions; a firong herb which being hung in a linnen cloth near fish-ponds, driveth away all Otters and Bevers. The hair of the skin is most fost, neither doth nin-ponus, unvein away and the sale as also for that no rain can hurt it, when it is well dressed it leefe his beauty by age; for which cause as also for that no rain can hurt it, when it is well dressed it is of great price and estimation, and is fold for seven or eight shillings: thereof also they mske fringes in hems of garments, and face about the collars of men and womens garments, and the skin of the Otter is far more pretious then the skin of the Beaver; and for this cause the Swetian Merchants do transport many into Muscovia and Tartaria for clokes and other garments.

Use of their skins.

Albertus.

Taking and

hunting of

Otters.

Thereof also in Germany they make caps or else line other caps with them, and also make flocking. foles; affirming that they be good and wholesome against the Palsie, the Megrim, and other pains of the head. The bloud of an Otter is prescribed against the swelling of the Nerves. The Liver dryed in an Oven against the Bloudy-flix, and against the Colick being drunk in Wine. The stones are also prescribed to be given against the Falling-sickness, and all pains in the belly. And

There be certain beasts which are kindes of Otters, which because they live in the waters, thus much for the Otter. and yet being unknown to us in England, I have thought good to express them in this place by their Greek and Latine names. In the first place that which the Grecians call Laten, broader and thicker then an Otter, and yet liveth in the waters, or elfe goeth to the waters for his food, yet breatheth air and not water like Otters. The hair of this Beaft is very hash, betwire the similitude of a Sea-calf and a Hart, and it hath also strong and sharp teeth, wherewithall in the night season they shear asunder small boughs and twigs: It is called also Fester, Lamyakyz, and Noertza.

There is another called Satyrium, and Fassuron, and Chebalus, whose skin is black, and very pretious, and very much used for the edging of the best garments: these live also in ponds, lakes,

There is a third kinde called Satherium, Kacheobeon, and Kachyneen, and Martarus, having a white throat, and being as big as a Cat; and finally unto these may be added Porcos, a four-spoted beaft living in the waters in the River Ifiber : And Mafolus another four-footed beaft living in some Rivers of India, being as big as as a Calf.

of

of the Rantbenill sit

Here have been to many names devited for this one beath, that it is grown a difficult thing, The feveral either to make a good reconciliation of the Authors which are wed to their feveral opinish there, ons, or elle to define it perfectly, and make of him a good methodical Hiltory : yet feeing the greatest variance bath satisfy from words, and that which was devifed at the first for the better espication and description of it hath turned to the obscuration and shadowing of the truth, Terus it hall be a good labour, to collect out of every Writer that which is most probable concerning this Best, and in the end to express the best definition thereof we can learn out of all.

First of all therefore for as much as all the question bath farifen from the Greek and Latine names, it is most requisite to express them, and shew how the different construction begani The Gracians do indifferently, vall Pordalie, Pardalie, and Panthet the Latines, Rambera, Bardalie, Pardu, and Lepardue, and these names are thus distinguished by the learned Pordalie they lay figuleth the male, and Pardale the female, and alfo Ranthere among the Latine for the temie, and Farden for the male, and these are understood of a simple kinde without commixture of generation. Legogram, the Leopard or Libbard, sia a word devised by the later writers, comme pounded of Les and Pardus, upon opinion that this Beaft is generated betwixt a Partial and a Lion, and to indeed it ought properly, to be taken, if there be any fuch .. Pliny is of opinion, that Pardus differeth from Panbers in postlying but in fex, and other fay, that betwixe the Lions and the Pardis there is fuch a confused mixed generation as is betwixe Asses and Marks, or Stallions and Affes: as for example, when the Lion, covereth the Pardal schemiss the Whelp ralled Leopardu, a Leo-

Alles a loc example, when the Lion, covereth the Pardalethenisthe Whelp railed Lopperau, 2:120-pard or Liberth, the physical sources the Lionefet then is it called Pamber a Paintheror I this controversite the Lionefet than the controversite the Lionefet than the controversite the Lionefet than the controversite of the Lionefet than th another Beaft rifing out of the Sea, having ten horns, and he faith it was title Pardalet, which Endmet translateth Recomma Heapard (Den. Sh. Pardut (Normet) vigilet superitivities me course, in the gradient of the City, that he my tear in pieces, every some that groups forther pardut was spent the Greciam translate Pardulit, a Rail of the sea of the Have the superior of the Have the Rail of t cording to 51 sty day, the Mountain of the Leopards is differn from Tripolity in the holy land the

definition of

Pardals and

Leopards.

leagues Kajis and Avicen, two Arabiant, do call the Panther and Leopard by one name, Alebeib, or leagues Kajis and Aucen, two Arabians, or Call the Panetter, Pardal; Albard, and Leopard, are but one Beatt, called by divers names. For the farther manifesting hereof, it is good to examin what is one Bean, caned by divers names. For the Jacobs that fo having expressed that, it may be clear by the said of the Pardal and Leopard in particular, that so having expressed that, it may be clear by the discourse succeeding, that there is no difference betwirt them and the Panther, or very small. First of all therefore it is faid of the Pardu, that it differeth not from the Panther, but only in fex, and or an increasore it is into or the Furum, that of divers spots. Arifolie writeth thus of it, Chin Che. that the skin nath received a natura) timedistin of the Chamelion is spotted like a Pardals, and in remalionitis diffinitis macuilis in ratualia. The shill be shill was wont to flut up his drunken friends, lation of Lampridius, where he sheweth how Heliogabalus was wont to shut up his drunken friends, tation of Lamprium, where he thewest there efacts in cubiculo eodem Leones, urfor, Pardos cum luce, vel quod est gravius nolle invenitent, ex quo pleriq; examinati funt, and so forth.

By which words it is apparent, that those which in the first place he calleth Leopards, in the last place he calleth Pardals, and the only difference betwirt the Leopard, Pardal, and Lion, is that the place he called l'attain, and the only and therefore they are called lignobiles Leones. Ifidorus and Solinus Leopard or Pardal have no manes: and therefore they are called lignobiles Leones. Ifidorus and Solinus write in this manner: Pardus secundam post Pamberam en genus, varium ac velocissimum, & prietys ad salinus write in this manner: Pardus secundam post Pamberam en genus, varium ac velocissimum, & prietys ad salinus salinus salinus manner. Pardus secundam post partie pardus priety salinus salinu very fwilt, greedy after bloud, and catcheth his prey by leaping : the Leopard is bred betwitt the Pardal and the Lioness, and so that maketh a third kinder by which testimony it appeareth, that these names make three feveral kindes of Beafts, not difting in nature, but in quantity, through commix-

The greatest therefore they call Panthers, as Bellanenifis writeth. The second they call Pardals, and the third, least of all, they call Leopards, which for the fame cause in England is called a Cat of the Mountain. And truly in my opinion, until fome other can fhew me better reafon I will fublicibe hereunto, namely that they are all one kinde of Beaft, and differ in quantity only through adulterous generation. For in Africk there is great want of waters, and therefore the Lions, Panthers, and other Beafts do affemble themselves in great numbers together at the running Rivers, where the Pardals and the Lions do engender one with another: I mean the greater Panthers with the Lionesses, and the greater Lions with the Panthers; and so likewise the smaller with the smaller, and thereby it cometh to pass that some of them are spotted, and some of them without ípots.

The Pardal is a flerce and cruel Beaft, very violent, having a body and minde like ravening birds, and some say they are ingendered now and then betwist Dogs and Panthers, of betwist Leopard and Dogs, even as the Lycopaniters are ingended betwist Wolves and Panthers. Ten the lattices these Pardals in Africk, to get up into the rough and thick trees, where they hide themselves amongs the boughes and leaves, and do not only take birds, but also from thence sead down upon Beafts and Men when they espyrateir advantage; and all these things dd belong unto the

Concerning the Leopard, the word it felf is new and lately invented; for it is never found imong any ofithe ancients, before Julius Capitdinuifor Sparilanus. Sgivaticus maketh ho difference betwitt Pardalis and Leopardus, and the Italian) generally calls Pardal Leopardo, and never Pards, except tone of the Poets, for brevity sake in a verse, be The Leopard is like to a Lion in the head and form of his members, but yet he is leffer and nothing fo ftrong : by the fight of a Leopards skin Gifti made this defeription of the Beaft :

The length (faith he) from the head to the tail; was as much as a mans stature, and half a cubit. The tail of it lelf three fpans and a half, the breadth in the middle three fpans, the colour a bright

yellow distinguished into divers spots, the hair shore and mossie.

The price of the skin was about five hobies, op forty dillings, for they differ in price, according to the Regions out of which they are brought, they which come further are fold deaper, and they which come lefs way are fold cheaper. It is a wrathful and an angry Readt, and when force it is shick, it thirsteth after the bloud of a wide Cat, and recoveresh by furthing that bloud or elfe by eating the dung of a man. Above all other things it delighteth in the Cating that bloud or elfe by eating the dung of a man. Above all other things it delighteth in the Cating broat fire, and therefore lyeth underneath it, to keep it from spoil; and white fort the Panther delighteth in west game and specific and therefore no marvel if they cannot abide Carlick, because it, annoyed that follows and it is reported by S. Ambrole, that if the walls of ones house, or sheep coat be donointed with the juve of Garlick, both Panthers and Leonarda will with super from it, but of this anointed with the juyce of Garlick, both Panthers and Leopards will run away from it, but of this matter we shall fay more afterwarden bas , and not gat

The Leopard is sometimes tamed, and used in Read of a Dog for hunting Both among the Tate rians, and other Princes, for they carry them behinderhem on Horfe-Back, and when they fee a Deer or Hart, or convenient prey; they turn them down upon them fodainly who lake them and delivoy them; yet such is the mature of this Beaft; as also of the Pardal a this if he does not take his new table in the mature of the Beaft; as also of the Pardal a this if he does not take his new table to the mature of the Beaft; as also of the Pardal a this if he had not take his new table to the mature of the Beaft; as also of the Pardal a this if he had not take the mature of the Beaft; as also of the Pardal a this if he had not take the mature of the beaft and the mature of the beaft as a second to the mature of the beaft as a second to the not take his prep at the fourth or fift jump; he falleth fo angry and fierce, that he define the whomsoever he meeteth, yes many times his Hunter. Therefore the Hunter hays aways a regard to carry, wish than a land a supplementation of the supplementat a regard to carry with them a Lamb or a Rid, or forme fuch five thing, wherewith they pacife him after he hath miffed his game; for without bloud he will never be appealed; and his much shall suffice to have spoken of the difference betwith Panther's Pardals; and Loopids, and their several names in Greek and Latine, from whom almost all Nations do derive their denominations.

denomination, for the Italians call it Leonparde ; the Frenth, Leopard, and Lyopard; and Germans, Lep. The names in denomination, so and Pamberebier , the Spaniards, Leappardels, and Leaparde, the Illyrians, Leubage, other lanped, and some make no difference betwixt this and the Arabian Wolf: The reason guages. the County word Pardalic or Perdalis, (for they fignific both one) feemeth to me in most probabiof the Greek work a straight of the Howest word Pardes, fignifying a Garden, because as colours in a Garden den make it spotted, and render a fragrant smell, so the Panther is divers coloured like a Garden of fundry flowers, and affo it is faid to carry with him a most sweet favour whither sever he goeth, inners in ancient time they made their Ivory tables flanding upon pictures of Panthers, whereof Jumnal writerb thus in one of his Services:

Of the Pamber lake

Olim en quevis arbore mensa flebat.

At nume divishue comandi nulla voluptas and processione entitis ques mitets pares Spenes. mill fuffinet orbes and ale and I Jam nimies capitly graves, Och

For the fame cause Pardalit was the name of a notable Harloty for as the Pantherenby their sweet. feells draw the Beafts unto them and then deftroy them, fo alfo do Harlots drek and adorn themfelves with all alluring provocations, as it were with inchanted odours, to draw men unto them, of whom they make spoil and repine : There is a pretious stone also called Lapis Rawherst, brought out Ever whom they many apoint a man look before the four-rising be shall see divers colours, namely, black, sylvations of lidie, whereupon if a man look before the four-rising be shall see divers colours, namely, black, sylvations. or many, whilest, purple, and Role colour, and they fay it hath as many vertues as it hath colours). Albertur. wir fines doi la rot : chasti a al total Vattomani. but I lift necto follow the name any further distinct

The Countries breeding Panthers are Abafia in the Kingdom of Melacha, in the Ille of Sumarida Countries of Likewicia Ales, especially Syria, for there are mone in Europe; all Africk over they are plentiful, as Panthers, in Lylis and Manthants where abound all store of wilds Beatts! Likewice beyond Gastaups; for Apolomius and his companions faw there many Lions and Panthers, an Arabia the farthest part, namely the Promontory of Dyra towards the South, are the fironged Partials of the world, (as faith Strabe:) Likewile in the Mediterraneau Region beyond Barrenza toward the South, unto Dachinabades, and cowards the Baft are all forth of wilde Beafts, both Tygers and Pantheres and Discous writeth that in that part of Arabia, joyning upon Syria, these Lions and Pardale are both mote in number and greater in quantity then in Lybias d'bas, altrayban and a tomas de

Alfoit is faid by Volaterranus and Gillius, that the Panthan of Lysia and Coris are very long, but yet week and without parriage, being not able to leap far, yet is their skin fo hard as no Iron can piered. Burint the River Gauger and Hiphofit, spollonine faw many Panthers. The Indian also breed many Les Africa

It isapparent by that which is already faid, that the Panthet is the name of the greater Pardall The feveral set the Leopard of the leffer; which the Arabims call Alueur, and Alford, Alcour is bigger then pares of Pan-Ling burlikes Leopard, having greater and that per mails and feet; black and tebrible oyes, and there. therefore kronger, fiercer, and bolder then the Leopard, for it lesteth upon men, and dekroyeth then. Oppiones describeth both kindes in ohis manners. There are (land he) two kindes of Pardis, a greater and a leffer, othe greater are broader backt, and higger in quantity of the leffer ibes ing less inquantity, but not inferior instrength : both of them have the fame thepe and colour of body, except in their tail : for the greater Bardal hath the feffer tail, and thelleffer the greater a eithr of them have folid and found abighe, a very long body, bright froing aves, the apples where, of do gifter under their eye-lide, which arbgray and rod within like to burning roals, cheir booth paleand ventuous, their skir of thivers colours, yet bright and pleasant, the specificating like so many blackeyes upon it at his sat Opianus. Such aking are offsettines fold in the Marre of things, which are brought in bundles twentuy or thirty together, and it is not to be songorten, which it depends on the state of the same trought in bundles twentuy or thirty together, and it is not to be songorten, which it depends on the same trought in bundles twentuy or thirty together. The same trought in bundles twentuy or thirty together, and it is not to be songorten, which it depends on the same trought in bundles twentuy or thirty together. the rulget Leopards in all parts, rescept chat is wanteth a said, and they lay that if this Beaft be feen by a woman it will inflamily make her to be fickly but to proceed to the relidue of the parts of their Buffe, we must remember sharewhich Melfole writeth in his Phyliognomy ; as is reported by Mar wholing: Langer follis firmans mounter illoans ipno for fers, Pardalls vera furningam formam contribut; acutihut tomum exceptis, quibus ad invadendum fortiter utitur, that is to fay: Among all Beatts the Lion dotte will refemble the male, and the Bardalaho femble, exception the legs which firstufethico take ther Mountain 2 see through structure and sair, when the control bring the niverse of the rese, was good a survice of the rese, and a special and a survice of the rese, and a survive of th

torched, care tacher round them thought for proced, a neck very long and illender; the breat not will be out with allow because and ship are featle; the back long, the bucked and thighs were feeling, the Participont the final of chie belly or loins are more mooth, lest hollow and bunchy y the colour, die ven, and the whole body limit titulate, and not well compounded for the outward dight : and it is to be remembered (faith Gardan), shoo all ravening Boats are like a Cat, as Lions, Panthers, Lincos, and Pardale, for they have in common the length and strength of their clawal beautiful party, 20% loured skins; a little head and round face, a long tail, nimbleness of body, and wildeness of natures

living upon the meat they igned hunting. One was a limit of the superinter by the first call a Pardal Berbelly, and Society describeth at hus. In his red or yellow heire by described a first call a Pardal Berbelly, and Society described have been been been as if they were mainted. ike a Lionels, but fee with dirers black spots both in length and byeadth, as if they were paisted. It bath a brown fave, aspersed with black and white, and it is to be remembered, that as other

Pliny.

ateth like a life. The females have four udders in the midft of their belly, the heart is great in proportion, because the is a violent Beath, terrifying man. There are many fiffures in their feet. Their former feet have ne is a violent Beaus certifying at their hinder-feet but four-for little ones among four-footed beafs have five fingers upon their hinder-feet: when they go, they hide their nails within the skin of their feet, as it were in theaths, never bringing them forth but when they are in their prey, to the intent they thould never be Broken nor dulled. Their tails have no long hairs at the end like a Lions of Oxes; and the Leopard hath a wider mouth then the Pardal.

Panthers.

Oxes; and the Leopatu nath a wheet then the male, the reason is given by Volaterian; because she is inforced to feek abroad for her own meat and her young ones. The place of their aboad is among the Mountains and Woods, and of pecially they delight in the tree Camphory. They raven upon fish both Birds and Beafts: for which cause they hide themselves in trees, especially in Mauritain, where they are not very swift of foot, and therefore they give themselves to take Apes, which they attain by this policy : When they feethe Apes, they make after them, who at their first approaching climbe up into the tops of trees, and there fit to avoid the Panthers teeth, for the is not able to folto tow them fo highy but yet the is more cunning then the Apes, and therefore devileth more thifts to tow them to might out yet me is more canning character the region in the might supply that want by the gifts of the minder Forth therefore the goeth, and under the tree where the Aptivare lodged, the lyeth down as though the were dead, firetching out her limbs, and reftraining herbreath, fourting her eyes, and shewing all other tokens of expiration. The Apesthat sit on the tops of the tree behold from on high the behaviour of their adverfary, and because all of themself berdead, the purious of their adverfary, and because all of themself be they they much they defire, and yet dare not defeend to make tryal. Then go end their doubts, they chuse out one from among them all, whom they think to be of the best courage, and him they fend down as it were for an efpy, to certific all the relide i forth then he goeth with a thousand fears in his minde, and leapeth from bough to bough with no great halt . Tor dread of an ill bargain :) bet being come down, dareth not approach right, but having takena view of the counterfeit, and repressed his own fear, returneth back again a After a little fpace he descendeth the second time; and cometh neaver the Panther then before jet stumeth without touching him. Then lie descendeth the third time, looking into his eyes, and maketh triel whether he draweth breath or no, but the Panther keepeth both breath and limbs immovesble, by that means imboldning the Aper to their own deftruction ; for the Spie-ape fitteth downbellde the Panther, and firreth not : now when those which are above in the tree, see how their tytelligencer abideth conftantly befide their adversary without harms, they gather their fairles together, and defrend down in great multitudes, Turining about the Panther, first of all going upon him; and afterwards leaping with great joy and exultation, mocking this their adverlary with all their spill toys, and tellifying their joy for her supposed death : and in this fort the Panther suffereth them to com tique a great feafon; till he perceiveth they are throughly wearied, and then upon a fudden he leapeth up alive again, taking fome of them in his claws, destroying and killing them with seeth and milk till he have prepared for himfelf a rich dinner out of his adversaries fleth. And like as Uhffer es dured all the contumelies and reprosches both of his maids and Wives fuiters, until he had a jultoo casion given him of revenge, fo doth the Panther the distainful dealing of the Aper whereupon came the proverby Pardi mortem diffimulat , Thanaron Pardaless bypoormetal , againfraccunning diffembling fellows fuch a one as Brut was , who counterfeited madnels than he might get the विक दूसरी प्राप्त संस्थाति स्वारा स्वारा स्वारा So great is the love of this Beats to all Spices and Aromatical trees, that they come over all the

a Panther; for we have thewed already whow he doth cover both his head and his body to take his prev. 1 1151.00

This Beaft is never so tamed but that he falleth into his wilde fits again. Their love to their young ones is exceeding great, for if at any time while they are abroad to forage, they meet with Hunters that would take them away, they fight for them unto death, and to fave them from blows, interpole their own bodies, receiving mortal wounds, but if they finde their young ones taken out of their des

their own bodies, receiving mortal wounds, but it they finde their young ones taken out of their ded in sheirable howling.

Densetring the Philosopher, relates their flory of a Painther, that lay in the high way to meet with a man to help her young ones out of a ditch of deep pit wherein they were failed, at length their appeared in her dight the father of Philosopher, who prefertly began to the away aftoon as he saw the Beatty but the poor differiled Philosopher, who prefertly began to the away aftoon as he saw the Beatty but the poor differiled Philosopher who the said formed the house for the poor differiled Philosopher who the said formed the house for the poor differiled Philosopher who the said formed the house for the poor differiled philosopher who the said formed the poor differiled philosopher who the said for the poor differiled philosopher who the said of the poor differiled philosopher who the said for the poor differiled philosopher who the poor differiled philosopher who are provided the poor differiled philosopher who the poor differi though the had fome fute unto him, and took him lightly by the skirt of his garment will one of her claws : the man perceiving that the gave fuck by the greatness of her Udders hanging order her belly, began to take pity upon hery and layed away fear, thinking that indeed which happened, that her young ones were taken from her by one means or other; therefore he followed her, the drawing him with one of her feet unto the cave whereinto her young ones were fallen, out of which he delivered them to the mother as ranfome for his own life, and then both the and the young ones did follow him rejoycing, out of the danger of all Beafts; and out of the Wildernels, diffuiffing him without all manner of harm, which is a rare thing in a man to be fo thankful, and much more in a Beaft: and unto this story of shelr love and kindeness to their young ones, I may add another, wor. thy to be remembred out, of Alianmath

A notable flory of a Panthers love to his companion.

There was (faith he) a man which brought up a tame Panther from a whelp, and had made it fo gentle, that it refujed no fociety of them, and he himself loved it as if it had been his wife. There was also a little Kid in the House brought up tame, of purpose to be given unto the Panther when it was grown to some stature or quantity, yet in the mean season the Painther played with it every day; at last it being ripe, the Master killed it, and last it before the Painther to be street, but he day: at last it being bipe; the Master killed it, and said it before the Panther to be estail, but he would not touch it, whereupon he sasted till the next day, and then it was brought unto binispin, but he refused it as before; at last he sasted the chird day, and then it was brought unto binispin, but he refused it as before; at last he sasted the chird day, and making great moan for itself, according to he usual manner, had the Kid laid before him the third dive; the door Beast setting discharge would serve the turn; but that he must sether eat up his thamber settion of the first salt would make him continually sast, he ran and killed another Kid, disdaining to include with this which was him continually sast, he ran and killed another Kid, disdaining to include with this which was him former acquaintance, yea though it were dead; herein excelling may wicked him, who do not spare; those that have lived with them in the greaters small writer and friending; to undo had overshow them always for the advancemble of sastements. throw them alive for the advancement of themfelves.

The harms of

We have faid already, that they most of all resemble Women, and indeed they are enemied to all creatures. The Leopards of Barbary do little harth to men that they meet, except rife, miel them in fome path way where the man cannot decline the Beatt, nor the Beatt the Man, there they resp not fiercely into his face, and pull away as much fleth as they can lay hold upon, and many of then with their nails do pierce the brains of a man.

Leo. Afer. Albertus. Avicenna. They use not to invade or force upon flocks of Sheep or Goats, yet Wheresolver they less Dog, they initiately kill and devour him. The great Parther is a terror to the Dragon, and the Oragon sethet it, he flyeth to his cave. The lesser Parther or Leopards do overcome Wilver being linguished and hand to hand a second or the lesser Parther or Leopards do overcome Wilver being linguished and hand to hand a second or the lesser Parther or Leopards do overcome Wilver being linguished. ing lingle, and hand to hand as we fay, but by multitude they over-mafter and deftroy him, for if he endevour to run away, yet they are swifter and easily overcome it.

Pliny. Orus.

There is also great hacred and enmiter betwitt the Hyana and the Panther, for in the presence of the Hyana, the Pardal dareth not refift; and that which is more admirable, if there be a piece of an Hyanasakin, about either man or beaftithe Panther will never routh it and if their the after the be dead be hing up in the presence of one another; the hair will fall off from the Panther; and therefore when the Egyptians would fignific tiow a Superiour was overcome by a Interior, be picture those two skins. If any thing be anothered with broath wherein a Cock hath Been folders. neither Panthers nor Lions will ever touch it , especially if there be mixed with it the live of Garlick.

Pliny. Rafis. Affenlapins.

The terror of

Leopards are afraid of a certain eree ealled Leopard arbor , Leoparderite. Panither ste allo Leopards are alraid of a certain tree called Leopards abor. Leopards rive: Panilies in all afraid of the skull of a dead man, and run from the fight thereof: yet it is reported; that wo year before the death of France King wife France, two Leopards, a maile and a female where fight in France into the Woods, either by the hegligence or the malice of their Keepers that it makes and a temale, and about Orleanse two in pietes many men and women; at that they called killed a Bride, which was that day to have been marryed; and alterward their west found min, eithalts of Women destroyed by them, of which they had eaten nothing but only their breast with things! I might express many in this place; whereby the temperature of Afraghe God against manifely in the same of the same and in the same of the same and in the same of the same and in the

Laws againft;

For this cause we read in ancient time how the Seriators of Rome flave these of publishment against them that should bring any Panthers and Italy, especially any African Beauts; and the first that gave dispensation against those laws was driver African the peoples This Editor, who become africant or the side of the Circonstan games; and then Stainer in the office of his Editor brought as on the hundred and fifty. After him Pomps the great, four hundred and ten, and lastly Adjusted that remembers and the control of the control

remembred and renowned Emperory four flundred and twenty. Thus laws which were first made by great men and good Senators, for the fafety of the common wealth, became of no great value, because as greet or greater then the Law-makers, had a purpose to advance themselves by the practice of those things which law had juffly forbidden: for it those decrees had flood effectual, as the victorious Champions had lolt that part of their vain triumphs, fo many people had afterward been preferved alive, who by the cruelty of thefe Beafts were either torn in pieces, or elfe received

It was not in vain that the bleffed Marryt of Jefus Christ Ignorius, who was afterwards torn in pieces by wilde Beatts at Rome, did write this in his Bpistle to the Roman Christians concerning his handling by the Roman Souldiers, as he was brought prisoner out of Syria to Rome. A Syria Roman nanum page cum bestitt depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitt depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitt depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitt depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut depugno per terram & mare, die notteque vintus cum decem Leopardis, bec est cum militari cu-soft cum bestitut de mare, die notte cum decem de cum decem de cum decem de cum militari cu-soft cum decem decem de cum de cum decem de cum de cum decem de cum decem de cum decem de cum decem de cum de cum decem ing night and day held in bondage by ten Leopards, I mean ten Souldiers, who not withflanding many benefits I bestowed upon them, yet do they use me worse and worse : and thus much for the cruelty

of Panthers and Leopards.

We have shewed already how they become tame; and are used in hunting, unto which discourse. The nature of (fomewhat out of the place) I will adde a true narration of two Panthers of Leopards nourified in tamed Pan-France for the King, whereof one was of the thenels of a great Calf, and the other of a great Dog, thers. and that on a day the leffer was brought forth for the King to behold how tame and tractable he was and that he would ride behinde his Reeper upon a cloth or pillow being tyed in a chain; and if a Harehad been let loofe in his prefence; and he furned down to her, within a few jumps or leaps he would attain and take her. When the Reeper was to take up the Leopard again, he did come to him backward, left if he fhould fee his face, he should leap upon him and wound him, (for as we have faid they are angry being chafed, and are ready to fly into the Flunters face) therefore he turneth his face away from him, and betwint his legs reacheth him's piece of bread or fieth, and so he gently taketh him into his chain and collect again, leading him away to his hould, and alloon as the man was mounted the Beast also knew his seat, and leaped up after him.

And the same party also related, that when as a Lion was turned forth to a Bull, the Lion very

quietly without furring lay down and did no harm, or offer any violence of combate with the Bill s but afterward when as the two Leopards were turned forth to the fame Bill, they inftantly rans and took the Bull by the throat; and without all doubt they had first and pulled out his throat, (had not their Keepers which had long thains tyed about their necks in their hadde) refrained and pulled them off again. By this may be conjectured how great is the rage of the wilde and untamed Leopards and Panthers; feeing the came and gentle are fo cruel; and theriore the Lord in the Prophets did most wisely compare the siege of the Affilant about failum to a Leopard, watching at the gates of the City to destroy all that came out thereat. Having thus discoursed of the nature, parts, kindeness, love, and hatted of these Beats in general. The taking of

it now followeth to express the best means to avoid and destroy them, that fo, we may not only know Panthers.

our enemy, but also learn the way to overmatch and curb him.

There is a kinde of Henbane which is called Pardallanebet or Libbard bane, which the Inhabitants Diefeorides. of Phonaem, and the Mount Ida, were wont to lay in the Mountains for the defitiving of Leopards, Padals, and Panthers. This herb is not much known at this day, yet I take it to be the fame which growth in many places of France, and Swidy, and it is taked Total, by the robot thereof beated to powder, and stopped up in flesh, not only Beatis, but also Wolces and Swide, as wilde Boars are destroyed it they take thereof: when the Beatis perceiveth Himbelt poyloned, prefettly he feekettly for mans dung for without that he cannot be desireted; wherefore the Hunters do allo place hear tinto it some valies of it hanging in a tree, with the mouth or way open that leaderth into it, whereinto the greedy Readle apeth, and being in cannot yet forth again but rather dyet with hunger of eller it takes and killed; for alle beat his defired mediatine, but all will be the fifth hunger of eller in the value of the but high; that the beat by trailing, himself to leap into it, and get his defired mediatine, but all wells with the time of his recovery full the poylon hab throughly corrupted his body, and when the time of his advertary, although, his was not hunger of the whom his defired mediatine. One of his belify.

Therefore the Panthers of Anthonaed one of his belify.

Therefore the Panthers of Anthonaed more of the belify in the poylon then by other violence of Swords, Spears, or Dogs. I for by this poylon's the Beat many times falleth to fach a looseness of his belify, and without in the mount of the Beat, that he is taken alive. I know he in the mount of this help, and without all harm to these belify, and without all harm to these belify, and without all harm to these beats; but if the Panthers or any ravening Beat come and devoure any of those Sheep in drefted, petitive the hear the set of Pholines, and the Mount Ida, were wont to lay in the Mountains for the defreying of Leopards,

beafis; but if the Panthers or any ravening Beaft come and devoure any of those Sheep to dreffed, presently they die by poylohing it.

When they are burned and forced in the presence of the Hunters; then they leap directly many, their heats, and therefore the Burner taketh great care both of his standing and also of holding, his foar, for if he receive not the Panther in his leap, and gore him to the state, or else otherwise woundhim mortally, he is gone; and his site is at an end. Opplant also showed him to the state, as Longar appeared to the world and his site is at an end. Lionare, especially by these means following; for when the Hunters perceive the way or path which heuseth to his water; therein they make a deep ditch! (but not to great as they make for a Lion) wherein they erect a woodden pillar or great post, unto that they tie certain engins, and withat

The History of Four-footed Beasts.

flept upon them in the night time. The Shepheards of Ætbiopia, called Agriofbagi do eat the flesh of Lions and Panthers, although it be hot and dry.

withall a male little Dog, whose stones or tender cods they binde with some string or cord, so as the withall a maje little Dog, whole itones which voyce he invitethand calleth the Panther to his young beaft may whine and cry for pain, by which voyce he invitethand calleth the Panther to his destruction; For the greedy beaft winding the voice of the Dog, bestirreth himself to meet with destruction: For the greeny heart winding the ditch, and feeing the Dog down, he leapeth, where his desired prey or booty; at last finding the ditch, and feeing the Dog down, he leapeth, where the engine take present hold upon him and destroy him; and so he describeth the same means to take

great fifnes by the fight of little fifnes swimming in a Net.

Oppianus.

eat times by the right of fitte mines water much make good choice of his Horse, not only in hunting of wilde beasts the wary Wood-man must make good choice of his Horse, not only for the metal and agility which are very necessary, but also for the colour, as we have already expressed in the story of the Horse: for the gray Horse is sittest for the Bear, and most terrible to him, the yellow or fire colour against the Bore p but the brown and reddish colour against the

The Moores also use other devices to take Panthers and all such noisome beasts, they enclose in a little house certain rotten flesh, which by the favour thereof when it ftinketh , draweth the wilds heafts unto it : For they make a dore, or a gate of reeds unto the faid house, through which the fil. thy smell breaketh out and disperseth it self into the wide air; presently the wilde beasts take it up, and follow it with all freed they can, for there is not any Musk or other fweet thing wherewithal men are fo much delighted, as ravening beats are with the favour of carrion: therefore like an amorous cup it draweth them to the fnare of perdition: for beside the rotten flesh, they erect many engine and unavoidable traps, to mare in the beaft, when he cometh to raven.

The Christians of Africk did institute a general hunting of Leopards, inclosing the ends of the ways through which the beafts were to pais: The Leopard when he was firred ran to and fin difracted, because in all his passages he found Horse-men ready to resist him, neither lest they any way for him to escape: at length wearyed with many windings, turnings, and provocations, the Horse men might easily come unto him and pierce him with their spears : but if it fortuned that the Leo. pard elcaped, and brake away from the Hunters; then he at whose corner he brake forth, was bound

by ancient cultome to make the relidue a dinner or banquet.

Among the Chainlain, there was a certain young Nobleman which loved a Virgin called Ambine! the which two lovers were walking together a good feafon in a Wood so It happened while they were there, that Cichy, we the Kings Son profecuted a Pardal in hunting, which was fled into that Wood, and feeing him, bent his arm against him and cast his Dart; the which Dart missed the mark and killed the Virgin Anthippe, the young Prince thought that he had flain the beaft, and therefore drew neer on Horse-back to rejoyce over the fall of the game; according to the manner of Hunters; but at his approach he found it far otherwife, for in ftead of the effution of the bloud of a bealt (chat which was more lamentable) his right hand had thed the bloud of a Virgin: For when he came to them he law her dying and drawing her last breath, and the young man held his hand in the wound to stanch the bloud ; for forrow whereof he presently fell distracted in his minde and ran his Horse to the top of a tharp Rock, from whence he cast down himself headlong and so

perified.
The Chamians after they understood this fearful accident, and the reason of it, compassed in the place where he fell with a wall, and for the honour of their dead Prince builded a City where he loft

his life, and called it Cichyrus after his own name.

Leopards and Panthers do alfo love Wine above all other drink, and for this cause both Bacthur was relembled to them, and they dedicated to him : Bacobum sauro affimilian & Pardall, que bomines ebill bellugrum iftarum ingenia referant, & omnia violenter agant, quidam enimitracundi fiunt Taurmuminflar, o puniques feriq; il Rardales, faith Plato in his second Book of laws, they resemble and compare Bacobis to a Bull, or Pardal, because drunken men in all their actions do imitate the disposition of there wilde beatts, both in their folly and violence : For some of them are wrathful like Bulls, and fome of them wilde apr to fight , like Pardals : Bacchas was alfo called Acbrides; Becanfe he wort the skin of a Hinde-call, which is ported almost like a Panther: and therefore a fearful man, or a drinken, variable and inconstant man, is said to wear a skin of divers colours, but the chier could with Panthers were dedicated to Backbu, was for their love of Wine; for all Writers do constantly and with one consent affirm, that they drink Wine unto drunkenness: the manner and end thereof is tiegantly described by Oppianus in this fort: When the Inhabitants of Lybis do: observe one listle forms ariting out of the fand and falling down again. fountain ariting out of the land, and falling down again, (as in the manner of fmall Springs which cannot encrease into great Rivers) whereat the Panthers and Pardala nie to drink early in a morning. before it be light; after they have been at their prey in the night time, the Hunters come and pour twency or thirty pitchers of old fweet Wine into the faid Fountain I then a little way from it they lie down and cover themselves with clothes, or with straw, for there is no facter either of tree or buthes in that Countrey.

In the morning the Panthers ardently thirfling, and being almost dead for want of drink, come unto the same fountain, and tasting of the Wine drink thereof great aboundance, which presently falleth to work upon their brains, for they begin first of all to leap and sport themselves, until they be well be well beared. they be well wearded, and then they lie down and fleep mak foundly, so which time the Hunters that lye in wait for them, come and take them without all fear or perill: Thus far On-

Concerning the ule of their feveral parts, I finde little among the ancients, except of their skins, for the foot-men and ancient Souldiers of the Moores did not only wear them for garments, but allo flex

The Medicines of the Panther, or Leopard.

Of the Poephagus.

If the skin or hide of a Leopard being taken and flead, be covered or laid upon the ground, there Avicenta. is such force and vertue in the same that any venemous or poysonsome Serpents dare not approach into the same place where it is so laid. The flesh of a Panther being roasted or boiled at the fire, and Albertus. smelled by any one which is troubled with the Palsie, or shaking in the joynts, as also by them which are troubled with the beating and continual moving or turning of the heart, is a very profitable and

excellent remedy for the same.

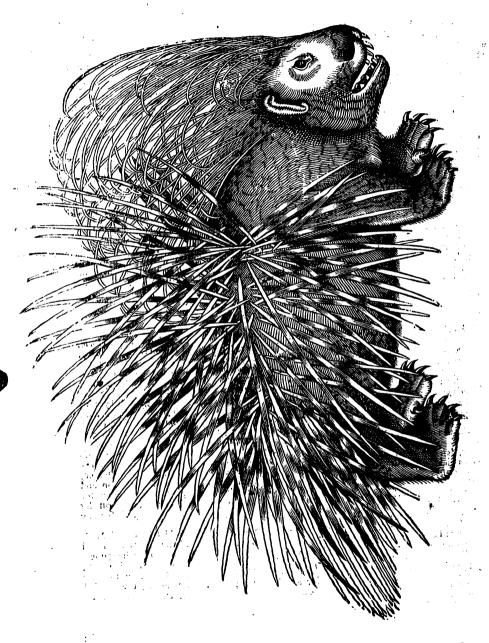

The same fat or sewet of a Leopard being mixed or mingled with the Oyl which proceedeth from the Bay-tree, and then mollified both together, and so anointed upon any one which is troubled with the scurfe or mangy, the scabs whereof doth cut or pierce the skin, doth presently and without any grief or pain cure the same. The twigs of a Vine-tree being dryed and beaten into small Refit. duft or powder, and mingled together with the fat or greafe of a Leopard, and so anointed upon the face of any one who is grieved with akings and swelling thereon, will not only cure and heal the same without any pain or forrow, but also preserve the same free from blemishes in the time of healing. The greafe also of a Leopard by it self, being anointed upon the head of any one who doth fled or cast his hair, or is troubled with the Foxes evill, doth immediately help and cure the same. The bloud of a Panther being anointed upon the veins or sinews of either man Ardem. or woman who is grieved with any swelling or akings therein, is very profitable and curable to Galen. expel the same away. The brains of a Leopard being mingled with a little quantity of the water which is called a Canker, and with a little Jasmine, and so mixed together and then drunk, doth mirigate the pain or ach of the belly. The brains of the same beast being mixed with the juyce of a Canker, and anointed upon the genital of any man, doth incitate and sir him up to lechery, but the marrow which cometh from this beast, being drunk in Wine doth ease the pain or wringing of the guts and the belly. The gall of a Panther being received into the body either in meat or drink, doth instantly and out of hand kill or poyson him which doth so receive it. The right stone of a Leopard being taken of a woman of a far spent age, doth restore unto her, her menstrual purgation being ceased, and doth make her to purge, if she doth heartily receive her ment more often.

Of the POEPHAGUS.

There is a beast in India called Poephagus, because he feedeth whom herbs and grass like a Horse, whose quantity he doth exceed double, for he is twice so, big. his tail is most thick and black, the hairs whereof are thinner then the hairs of a mans head; and therefore Indian women make great account of them, for with them they binde up their win fiair, platting it, and folding it in curious manner, every hair is two cubits in length, and apprione root twenty or thirty of them grow together: this great beaft is one of the fearfullest creatures in the world; for if he perceive himself to be but looked at of any body, he taketh him to his heess as fast as he can go, and yet although his heart be light, his heels be heavy, for faith my Anthor, Magie fludiose quam celeriter sugam peragit. That is, He hath a good will to run apace, but cannot perform it a but if he be sollowed upon good swift Horses, or with nimble Dogs, so as he perceiveth they are near to take him, and he by no means can avoid them, then doth he turn himself, hiding his tail, and looketh upon the fage of the Hunter with fome confidence, gathering his wits together, yet in fear-ful manner, as it were to face out his pursuer or hunter, that he had no tail, and that the refidue of his body were not worth looking after: but while he standeth staring on his Hunter, another cometh behinde him and killeth him with a Spear, so they take off the skin and tail, and throw away the flesh as unprofitable, for the other recompense their labour for their pains. Volaterraput relateth this a little otherwise, and saith that the beast biteth off his own tail, and so delivereth himself from the Hunter, knowing that he is not desired for any Elianus.

Nicolaus Venetus an Earl, writing of the furthest part or Province of Affa, which he calleth Maci- Eue. Silvi. men, and I think he meaneth Serica, because he faith it lyeth betwirt the Mountains of India and Calby, there are a generation of white and black Oxen which have Horses tails, but reaching down to their heels, and much rougher. The hairs whereof are as thin as the feathers of flying birds, thefehe faith are in great estimation; for the Knights and Horsemen of that Countrey do wear them upon the top of their lances and spears for a badge or cognizance of honour, the which I thought fit to be remembred in this place, because I take them to be either the same with these Indian bealts, or very like unto them.

A Ofthe Borougine on Randapine

Concerns and of them; ex. I findens in only of this quit, her with them it is cleared and awint quite done on which the concerns the form of the concerns of t unknown to them: The Greeinnesslips destible of the state brilly speckholny. Hogh Conthein quils which they beer upon their, back signs galled both Rivi it.e., Bifgriff at wife, pipes and both Africa, both have, brilles, sough hair, pipes prinkles, and aboth. Theracio bacella defined, and pipes, and aboth that the bacella defined and the pipes and aboth the control of the pipes and bis Godocaphes. It defined to be admired by the pipes of the his Godocaphes. It defined to be admired by the beautiful and the pipes of the bis Godocaphes. It defined the postories upon to back which he had they are applied to the both the pipes of t them, who write that this Beaft is a Sea-beaft, and not a Beaft of the land, nor yet those that make question whether it be a kinde of Hedge that or without all controversic, as the Arabians, Plny, Albertus, Bellunensis, and other do affirm, the vulgar Hedge-hog, is Ericius Sylvestris, and the

These are bred in India and Africk, and brought up and down in Europe to be seen for mony: Likewife about the City Cullem in Tariaria, by the fight of one of thefe it appeared, that it was three foot long, the mouth not unlike to a Hares, but with a longer flit or opening: fo also the head of the fame similitude, the ears like to the earl of a man; the fore-feet were like the feet of a Badger, and the hinder-feet like the feet of a Bear : thath a mane standing up in the upper part right or direct but hollow or bending before : Upon the bunches of his lips on either side of his mouth, there groweth forth long black briftles. The general proportion of his body is like a Swines, and they never exceed the stature of a Swine of half a year old.

Porcupine Ericius Montanus.

The four formost teeth hang over his lips, and that which is most admirable in him, the Quills or Thorns growing upon his back in ftead of hair, he useth for hands, arms, Thequils and

They first grow out of the back and sides, which are of two colours', that is parly black, and partly white, which whenfoever he pleaseth, he moveth to and fro like as a Peacock doth his tail : they grow in length two, three, or four hands breadths they stand not in any confused order of colours, but in well formed distinguished ranks, being therp at the points like a knife: When they are hunted the Beaft stretcheth his skin, and casteth them off, one or two at a time, according to the necessity upon the mouths of Dogs, or legs of the Hunters that follow her, with tording to the necessity upon the mouths of Dogs, or legs of the Faunters shat followher, with fuch violence, that many times they slick into trees and Wood, wherefore Solinia writesh thus, and also Faulus Venetus; Gum capiuntur, spinis suis sape beamines, or oanes Italian and canes in eos promais, adeo irritant seras illas, ut simul concurrentes terga sua quibus spinis innitiuntur vebementer commoveant, and in viciniores homines, or canes vibrent. That is to say, When they are taken they many times hurt both Dogs and men, for when the Dogs being provoked by them, run upon the backs which bear the quils, they are so far stirred, that they cast them off apon all that stand pear them, and therefore

The Hunters to fave their Dogs do devise engins and traps wherein to take them; besides the quils that grow upon their backs, they have also some upon their heads and necks, which they never calt off, but keep them on as a Horse doth his mane. The pilgrims that come yearly from never catton, but keep them on as a Horie doth his mane. The pilgrims that come yearly from Saint James of Composition Spain, do bring back generally one of these quits in their Caps, but for what cause I know not. The pace of this Beast is very flow and troublesome unto it, and therefore the ishardly drawn out of his den, which it diggeth like a Badger, from which it never goeth far, food. but feedeth upon those things which are near unto it: It is a filthy Beast, smelling ranck because it liveth so much in the earth being wilds it never drinketh, and I think it eateth Apples, Roots, and rinds of trees, and peradyentures Snail and such repelle creatures, but being tamed, it eateth all kinde of fruit, likewise breast, Pie-crust, and such things broken small. It drinketh also water, but above all other. Wine minded with water: In the day time it seemed, and in the night time it above all other, Wine mingled with water : In the day time it fleepeth, and in the night time it waketh, by which we gather, that being wilde it feareth the light, and therefore travelleth in the night time for his meat and living. It is a general live creature, and begetteth other in his own kind: the female bearing the young ones in her belly, as long time as a Bear, that is, thirty days; and also it hideth it lest four moneths in the Winter time, like a Bear, but whether for cold or any other cause the Authors do not express.

Inmy opinion for cold rather then for any other reason; although there be some that affirm it lyeth bid in the Summertime, and cometh abroad in the Winter time, contrary to the course of all other Beafts, and therefore such a Paradox doth want the testimony of some credible Writers, which should affirm it upon their own experience, or else it were requisite to bring sufficient reawhat mould affirm it upon their own experience, or elle it were require to pring infliction reaching the first party and first party and comming out of the large. It is also the first party and comming out of their party and comming the party of their party and comming the first party and the first that they and all his are all one. This Real wester of all Moore on by Com-

Of the Riemer, on Rudinger.

459

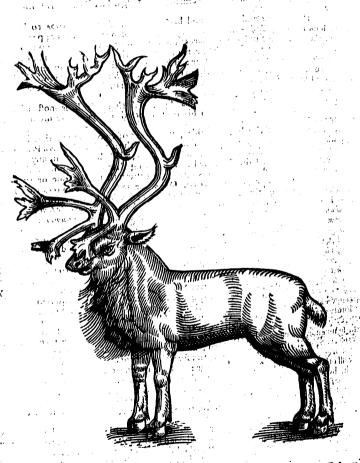

Concerning the use of their parts, I finde none but only of their quils, for with them it is faid Concerning the use or their parts, a line hoofe, likewife women were wont in ancient time to me them for parting afunder their hair in the top of their crowns.

parts.

1.13

The Reft of this Beaft is like a Hedge bogs, neither very natural for meat and nourithmen. The ule of the the rest of this Beatt is like a freehold by weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and other nor yet very medicinable; yet it is fail to help a weak and over-burthened Romach, to prount fleth, and the prount fleth and the help a weak and over-burthened Romach, to prount fleth and the help a weak and over-burthened Romach, to prount fleth and the help a weak and over-burthened Romach, to prount fleth and the help a weak and over-burthened Romach, to prount fleth and the help a weak and over-burthened Romach, to prount fleth and the help a weak and thelp a weak and the help a weak and the help a weak and the help a nor yet very medicinable: yet it is take the lookeness of the belly, and to diminish all Legrosses and scabbed Baulcerations and pushing the lookeness of the belly, and to diminish all Legrosses and scabbed Baulcerations and pushing the Reing falced it is is good against the Dropsie; and also very profitable, as Plating written, to be eaten by falced it is is good against the Dropsie; and also very profitable, as Plating written, to be eaten by the ten that cannot contain urine in their fields: yet the Grandans attribute no such quality unto this but to help the stomach and loosen the best hope attribute to the Sea-kog; and against the sprosse, sealing and incontinency of urine to the Helprice) beaten in meats or broth dock the Helprice deviation and is validable in History attention attribute these things to the Porenfpine: The powder of their quiliburnt, drunk or eaten in meats or broth, doth promote and help conception. Thus faith Autom, and herewithall I conclude this thort discourse of the

Of the Renner, or Rainger.

"His Beaft is called by the Latines, Rangifer; by the Germans, Rein, Reiner, Rainent, B. infinber; by the French, Raingier, and Rangher; and the later Laines call it Reingie, it a Rooft about the fire a Rooft about the fire and the later Laines call it Reingier, Of the feveral is a Beaft altogether unknown to the ancient Grecians and Latines, except the like chite that Pliny speaketh of be it : But we have shewed already in the flory of the file, that Alcer and Mblie are all one of the file. that Aires and Mblis are all one. This Beat was first of all discovered by Olam Mayon, in the

Northern part of the world, towards the pole Artique, as in Norway, Swella, Scandinavia, at the helt light whereof he called it Raingifer, quafi Ramifer, because he beareth horns on his head like the boughs of a tree. The similitude of this Beast is much like to a Hart, but it is much bigger, stronger. and initier. It beareth three orders or rows of horns on the head, as by the direction of Valentinu Creviu, and Beneditus Martinus are here expressed.

This Beaft changeth his colour according to the time of the year, and also according to the The colour and quality of the place wherein he feedeth, which appeareth by this, because some of them are found several pasts, to be of the colour of Asses, and shortly after to be like Harts. Their breast is full of long brissless, being rough and rigid through the same. The legs hairy, and the hoofs hollow, cloven, and moveable, which in his course he spreadeth abroad upon the deepest snows, without pressing his footthen star into them; and by his admirable celerity he avoideth all the wilde Beafts which in the Valhes he in wait to destroy him. He beareth very high and lofty horns, which presently from the root branch forth into two stems or pikes, I mean both the horns severally into two, which again at the top disperse themselves into pikes like the fingers of ones hand; In the middle of the horse there is a little branch standeth out like a knob, or as a huckle in the hinder-part of a Beasts leg!, from thence again they ascend upwards a great heighth, and do grow abroad at the top, where they are divided like the palm of a hand.

The horns are white, distinguished with long apparent veins, differing both from the horns of Elks, and the horns of Harts, from Elks in height, and from Harts in breadth, and from them both in colour and multitude of branches: When he runneth he layeth them on his back, for when he stands till, the lowest branches coming forth of the roots of the horns, do almost cover his face with thele lower branches.

In the Winter time when he is athirst, and cometh to the frozen waters he breaketh the ice : being wilde he liveth upon fuch fruits as he findeth in the Woods, especially the gum that cometh The uft of out of the Trees, and also the moss that groweth upon them, making himself shadowed dens and their lowest reiting places in the Mountains: but in the deepest cold weather he cometh into the Mountains of horns, Norway, towards Mossberg, and other hills. He is taken by the Countrey people for private uses. for he is profitable after he is tamed, both for the plough and travails in journies. The people called Lopp, or Lappones; do use them in stead of Horses and Oxen, for they have a kinde of Cart made in form and fashion of a fishers boat whereunto they join these Bealts to draw them, and the Carter hatha convenient fear fitted for him on the fore-part thereof, wherein he sitteth with his legs faft tied to the Cart, to the intent he be not saft off when the Beaft runs freedily ? he carryeth the reins whereby he governeth them in his left hand, and in his right hand a staffe, wherewithall he sustaineth

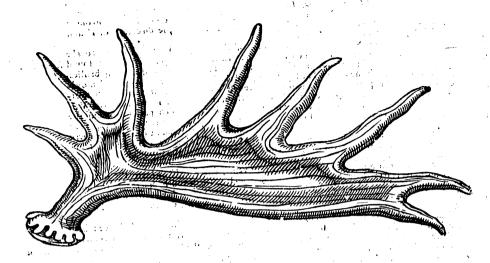

the Cart, when it is in danger of falling, and in this course they will continue indefatigably twenty German miles a day which is more then threescore English miles. At night when the Beafts are unyoaked, of their own accord, without guide or leader they will go to their feeding places, or accustomed stables. It is a very fociable creature, for they do live together in herds above a thousand in a flock, whereunto it may be the Lord alluded in the yo. Pialm, when he faid by the mouth of Asiph, All the Beasts of the field are mine, and the flocks of thousands which run wilde on the bills. The females want horns, and their milk is the greatest part of food to those Northern people: they have been seen at Auspurge in Germany sadied and bridled, for in their travails they need not have any provender earryed with them. for if ye turn them out in the midft of the Winter, they finde certain roots and moss under the snow whereof they eat, and con-

ten themselves. Their best food is grass. They are used both in Muscovia, Polonia, Bohemia, Scandinavia, and Malfinia, yet they can endure no heat, for being brought into Bobemia they dy.

Ther Carts which they draw must be made with a sharp edge at the bottom like a boat or ship as we have faid already, for they are not drawn upon wheels, but like drays and fleads upon the earth. There was a Lapponian which brought one of these into Germany in December, & he professeth he never felt so much hear of the Sun in all his life, as he did at that time, which is our coldest time in the year, and therefore how great is the cold which both men and Beafts endure in that Countrey?

The horns of these Beasts are to be seen both in Berne and at Auspurge in Germany; the feet are some what white, being rounder then a Harts feet, and more cloven or divided, wherefore at some times one part of his hoof may be feen upon a frone, while the other part refleth upon the earth, and in the upper part of the hoof where it beginneth to be cloven near the leg, there is a certain thick skin of membrane, by vertue whereof the foot may be firetched in the division without harm or pain to the

The King of Swells had ten of them nourished at Lappa, which he caused every day to be driven unto the Mountains into the cold air; for they were not able to endure the heat. The mouth of this Bealt is like the mouth of a Cow, they many times come out of Liponia into Spells, where they are wonderfully annoyed with Wolves; but they gather themselves together in a ring, and fo fight against their enemies with their horns. They are also in their own natural Countrey annoyed with Gulons, and generally all Beasts that live upon the spoil of slesh, are enemies upon them, and desire to destroy and ear them. In their pace, both slow and speedy, the articles of spens singular a noise like the cracking of Nuts. There was one of these Beasts given unto the Duke of samps in the year of our Lord 1561. In Scandivania they use them for the carriage of metals, disping of Chariots and riding, and the nerves of them when they are dead make bows, and for want of nails, they do saften planks and boards together.

Of the RHINOCEROS.

A preface to the fucceeding ftory.

mirable, both for the outward shape, quantity, and great ness, and also for the lawry way additious shaped; of this Beast next unto the Elephant was the first wonder, of whom we have shearly discoursed; for this Beast next unto the Elephant shearly of height of stature. And hang sow come to the story of this Beast, I am heartily forry, that so the light of stature. And hang sow come to the story of this Beast, I am heartily forry, that so the sight of stature. And hang sow come to the story of this Beast, I am heartily forry, that so the sight of stature. And hang sow come to the story of this Beast, I am heartily forry, that so the sight of stature. And hang sow come to the story of this Beast, I am heartily forry, that so the sight of she Creator, an adspect of morance of men, lie unfolded and obscured before the Readers syes; to the shear so unstantiate the sum of the body of the Mice, and of other small Beasts, and consider how large a treatile we have collected together out of many Writers, for the illustration of their natures and vulgar conditions, he cannot chuse but expect some rare and strange matters, as much shown to his minde about the story of this Rhinoceros, as the outward shape and picture of him, appeareth rare and admirable to his eyes: differing in every part from all other Beasts, from the type of his so to the tip of his tail, the ears and eyes excepted, which are like Bears. But gentle Reader, as thou art a man, so thou must consider since Adam went out of Paradise, there was never any that was able perfectly to describe the universal conditions of all forts of Beasts; and it has been the counsel of the Almighty himself, for the instruction of man, concerning his fall and natural weakness, to keep him from the knowledge of many divine things, and also humane, which is of the sound of the Almighty himself, for the instruction of man, concerning his fall and natural weakness, to keep him from the knowledge of many divine things, and also humane, which is of the same beauty of the same beaut

But for my part which write the English flory, I acknowledge that no man must look for that at But for my part which write the English Roxy, there: for I would be unwilling to write any thing my hands, which I have not received from some other: and truth on every part is to dear with any thing my hands, which I have not received from forme occurs and truth on every part is so dear unto me, that I untrue, or uncertain out of mine own invention; and truth on every part is so dear unto me, that I

untrue, or uncertain out of mine own invention; and with God and his works, for God needeth not will not lie to bring any man in love and admiration with God and his works, for God needeth not will not lie to bring any man in love and admittation with Beaft is firange and never feen in our the lies of men. To conclude therefore this Preface, as the Beaft is firange and never feen in our the lies of men. To conclude therefore this relations to the description: therefore hearken unto that

Countrey, so my eye-fight cannot add any thing to the description: therefore hearken unto that which I have observed out of other writers.

That there is such a beast in the worlds, both Pliny, Selinus Diodorus, Elianus, Lampidition a beast as the Rhinoccros.

First of all that there is such a beast in the worlds, both Pliny, Selinus Diodorus, Elianus, Lampidition a beast as the Rhinoccros, and others, do yeeld irrefragable testimony. In light page writeth, when Assert in his publick spectacles did likewise produce a Rhinoccrot specific writeth.) When Assert in his publick spectacles did likewise produce a Rhinoccrot specific writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome. Pompy the first with was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling which was the first time that ever a Rhinoccrot was seen at Rome (as Lampid other writeth.) Amonius Pling been a Tennice ball, the Epigram is this;

Q quam terribiles exarfit pronus in iras, Quantus erat cornu, cut pila T aurus erat !

Lastly to put it out of all question, that there is such a Bealt as this Rhinocerot, the picture and Lattiy to put it out of an question, that from the Beaft alive at Lysbon in Portugale, before many figure here expressed, was taken by Gefner from the Beaft alive at Lysbon in Portugale, before many rigure here expressed, was taken by organization that we have the Testimony both of antiquity and of the witnesses, both Merchants and others; so that we have the Testimony both of antiquity and of the witnesses, noth merchants and others, in that a fathion of this Beast, and that it is not the present age, for the Testimony of the form and fashion of this Beast, and that it is not the invention of Man, but a work of God in nature, first created in the beginning of the world; and ever since con-

tinued to this present day.

Concerning the name of this Beaft, the Grecians because of the horn in his Nose, calling Rhino-Concerning the name of this Beaft, and the Lating also have not altered that invention, for although The name and ceros, that is, a Nose-horned Beaft, and the Lating also have not altered that invention, for although The name and teres, that is, a trote-normal ball, and the horn, yet is there none that have that one horn growing reason thereof, there be many Beafts that have but one horn, yet is there none that have that one horn growing there be many Beauty that have put one norn, yet at here none that have that one, norn growing out of their Nose but this alone: All the residue have, the horn growing out at their or the control of the former of the Colorn, because of this one there be some that have taken this Rhimeerro for the Monoceres the Colorn, because of this one horn, but they are deceived, taking the general for the special, which is a note of ignorance in them, norn, but they are ucceived taking the Bent it is better to take the Rhinoceros for the Managen, and occasion of errour unto others; yet it is better to take the Rhinoceros for the Managen, and occasion of citour units of the special which is not contained in the general seconding to the because there is nothing in the special which is not contained in the general seconding to the maxime in Logick, Nibil est in specie, quod non prius suit in genere: And yet that is also abund, considering that Monoceros is not only a word of generality for all one-horned Beasts, but of particularity a name for the Unicorn, whereby is meant the Indian Affe, as we shall shew in the story of the Unicofn.

This Beast in the Hebrew is thought to be called Reem, or Karas, and therefore Munfier fo translatethit, Deut. 33. Tauri decor ejus, cornua Rhinocerotis cornua ejus, in eie ventilabit nationes ad summum ufq; terrs. His beauty is like the beauty of a Bull, and his horns like the horns of a Rhimerst, with

the which he shall winnow the Nations to the tops of the hils.

And Teriullian writing against the Heretique Praces, doth so translate it. If a man compare to-gether the Greek word Rhinoceros, and Reum, and Karas, or Rimna and Karas, he will easily think that either the Greciens have joyned together the two Hebrew words, as Rhinoceres quali Rem Karas, or Rimna Karas; or else the Hebrews have parted alunder the Greek word; for Rem and Rimna may very well come of Rhino, and Karas of Keros, yet herein I leave the Readers to their own judgement. The Indians call this Beaft in their tongue, Scandabenamet, as Fefus writeth, but we

will leave the name and come to the description of it.

Oppianus. The quantity and feveral

parts.

In quantity it is not much bigger then an Orys: Pliny maketh it equall in length on Elephant, and some make it longer then an Elephant, but which all they say it is lower, and tath shorter legs. Strabe in his 16. book speaking of the Etbiopian Region, neer India; called these Reinsecrats, Elebant and Called the Strabe and Girls the these three and Called the Strabe and Ca Strabe in his 16, book speaking of the Ethiopian Region, neer India, called these Rhinocerots, Ethiopian Buls, and saith that they are bred only in that Countrey, and by the relation of Angelemente writeth thus; Outoi de micron apoleipentai ton elephantom of rimokerotes; often Artemidorot spil, spi linau, writeth thus; Outoi de micron apoleipentai ton elephantom of rimokerotes; often Artemidorot spil, spil in to the metal, hei per corakenai phesas an Alexandria, alla schedon ti oson to upper opogetou aph beath in the properties. That is to say, The Rhinocerotes are exceeded by the Elephanto in length, but in section there almost equal them (as Artemidorus said) he saw by one that was at Alexandria; and the colour there of was not like a Box-tree, but rather like an Elephants, his quanticy greater then a Bulk of as the of was not like a Box-tree, but rather like an Elephants, his quanticy greater then a Bulk of a the colour secret that out of his Nose groweth a horn, harder then any bones, which he will be the straight of a armes, even as a Boar doth his teeth; he hath also two girdles upon his body like the wings of a armes, even as a Boar doth his teeth; he hath also two girdles upon his body like the other to-Dragon, coming from his back down to his belly, one toward his neck or mane, and the other to-Dragon, coming from his back down to his belly, one toward his neck or mane, and the other toward his loins and hinder parts. This far Strabo.

Whereunto we may add the description of other parts out of Oppianus, Pliny, and Solinus. His colour like rinde or bark of a Box-tree (which doth not differ much from an Elephant) and on his forehead there grow haires which feem a little red, and his back is diftinguished with certain purple spots upon a yellow ground. The skin is so firme and hard, that no Dart is able to pierce it:

Of the Khinoceros. and upon trappear many divisions, like the shels of a Tortoife fet over the skales, having no hair upon the back. In like manner, the Legs are scaled down to the hooves, which are parted into four distinct clawes; upon his nose there growth a hard and sharp horn, crooking a little tofour diffine crown of his head, but not so high: flat and not round, so that p and strong te quie-wards the crown of his head, but not so high: flat and not round, so that p and strong te quie-quid imputies, aut ventiles, did perfores, & ferrium estan & save iransigat, saith Oppianus and Etianus, that is, what so ever it is fer to, either it casteeth it up into the air, or else boreth it through though

ir be non or money.

Enderly faith, that the Reddiegree hath two horns in his note, but that is utterly falle, as you may fee in the picture: Although Marial feem to express for much in these Verses;

of the vol of Nanh provin cornu gemino sic extulit ursum,

The Romberrof tast up a Best into the sit, even as a Bull would do a ball which were laid upon the two horses we shall not need to apply Gemino cornu to the Bull, as Politically doth, but rather the if shall not heed to apply Gemino cornu to the Bull, as Politically doth, but rather the if shall not he the horse had if it must needs be liveral, it is apparent by the Picture that there is another little horn, not upon the note, but upon the wither of the Beast, I mean the cop of his shoulder next to shis neck, to that the error of Eucherius lyeth not in the number, but in the place is not that it may appear that this horn is not a faigned thing. Penjagras above two thoughd year ago writeth this. Reinsecrot in summonal cornu singulare est, or alsud for a ipsum non magnum, in capite human.

I do marvel how it came to passe that men which can mock and deride others to Passe the should be proved the Picture of th

should becalled proverbially Najuti bomines, except the proverb were taken from the Rhinocre who by reafon of his rrooked horn is faid to have a crooked note; for indeed a deformed noieis more subject to decision then any other part or member of the body, which caused Martiel to write thus :

Majaret nunquem rhonobi : juvenesa senesa; a Et puert nasum Rhinocetotis babent,

And therespon Florace allo faith thus;

Opinia faith, that there was never yet any diffinction of fexes in these Rbinocerstes: for all that ever were found, were males and not females, but from hence let no body gather that thereare no females, for it were impossible that the breed should continue without females, and therefore Pliny and Solinus fay, that they engender or admit copulation like Elephants, Camels,

When they are to fight they whet their horn thona thone, and there is not only a difford be-twit thele beafts and Elephants for their food, but a naturall description and enmity. for it is. confidently affirmed , that when the Reinogerot which was at Lisberne, was brought into the presence of an Elephant, the Elephant ran away from him. How and in what place he overcome the Elephant, we have shewed already in his story, namely how he sastened this horn in the fort part of the Elephants belly. He is taken by the same means that the Unicorn is taken, for it. is faid by Albertus, Isidorus, and Alumnus, that above all other creatures they love Virgins, and that unto them they will come be they never fo wilde, and fall afleep before them, fo being affeep, they are easily taken and carried away.

All the later Physitians do attribute the virtue of the Unicoms horn to the Rhimeerots horn, but they are deceived by imitation of Isidorus and Albertus: for there is none of the antient Greins that have ever objected any medicines in the Rhimocrot. The Indians, make bottles of their skins, wherein they put their Lycion, or succum medicatum, and therefore I will conclude this flory, with the riddle of Francisca Niger made upon the excellency of the horn that growth upon the nonspon the note

Of the S H. F. H. P. transid no.

The Several names.

The Hebrews have divers names, whereby they fignifie a Sheep and all that kind, as Zon, and Zoneth for which, the Septuagints do always render Probata, Sheep or little Cattell. The drable Zoneth for which, the Septuagints do always render Probata, Sheep or little Cattell. The drable is Rechelin, which fignifieth Sheep. Rebefeb, and Rabja, or Kibja, Itans, 3. Tabel, Neeplanab, that is Rechelin, which fignifieth Sheep. Rebefeb, and Rabja, or Kibja, Itans, 3. Tabel, Neeplanab, that is, a dumb Sheep, where the Hebrew is have Rachel, there the Chaldes, translate Repellah, The Arabians, Akalak. The Profians, Comelbantbu. Reber and Kibja lightle a Sheep, male and female under a bians, Akalak. The Profians, Comelbantbu. Reber and Kibja lightle a Sheep, male and female in Levit. 22 the year old, and Aiil, and Eel, for a Sheep above a year old, male and female. In Levit. 22 the year old, and Aiil, and Eel, for a Sheep above a year old, male and female. In Levit. 22 the year old, and Aiil, and Eel, for a Sheep aloo Ballo fignifieth a Sheep, although it be sometime taken brew is the same that Kebelch. Seb also signifieth a Sheep, although it be sometime taken for a Lamb or, Kid. Likewise Thaleb and Theleb Blai. 40. signifieth a Lambe, that sucking the harmonic with the Rodiack. The Sarazens at this day call a Sheep. Gameme, and Cattle Gailer, and the dung artes in the Zodiack. The Sarazens at this day call a Sheep. Gameme, and Cattle Gailer, and the dung of Cattle Hara Garien. The Greeiant call a Sheep Dias and Probatons, the Latins, Que, and by called To stant. Oweded or Skot. There and such like I might add more concerning the names of this cities of the singular account which God himself made of this beast. The Latines have so honored it of the singular account which God himself made of this beast. The Latines have so honored it of the singular account which God himself made of this beast. of the fingular account which God nimiest made or this peats. In e Latines have to honored it that after it they have named many of their children and stories, make, mention of most noble and gallant men, so casted. Such was Ovinim Camilling Severm Ovinima, Fabium Maximum Ovinima, gallant men, so casted. Such was Ovinima Camilling. Severm Ovinima, Fabium Maximum Ovinima, Olicus, Olicus Ajax, Ole, the wife of Charbippus, and many such other, if it were necessary to this story to telate them, but I will not trouble the Reader with any such unnecessary, encounters. I will therefore first of all begin with a relation of the Sheep of other Countries, and so in the countries of our ownest home. For the differences and so in the end make a more particular discovery of our own at home. For the difference of Regions do they powre water into it. The herbage of that Island is dry, yet profitable to Cattle and mich Beasts, and from thence came the original of the fat Cattel of Geryon. The Sheep of Greeks are lesser then the Sheep of Egypt; and the Over Pyribia, were like Boves Pyribia, namely, are lesser then the Sheep of Egypt; and the Over Pyribia, were like Boves Pyribia, namely, and receding stature, which name was derived from Pyribia their master, and owner. Among the of exceeding stature, which name was derived from Pyribia their master, and owner. Among the Psilvinii in India, their Rams are greater then our Limbs, and received in his books of husbandry affirment, that the Sheep of the Island are very small; and yet their Milk maketh very laudable Chiefe. In Span their best Sheep have black steepers at Poleutia, nicel the Apri, they are gray of those woolled in Asia and Bailda, called Erybbrea, they are red like Foxes, and from thence came the term of Erystres Out.

Ar Canusum the Sheep are vellow or Lion taken and Salling To. of hony-woolled in Affa and Ballea, caned Erystorea, they are red like types, and from the liber are the term of Erystorea Oves. At Canufum the Sheep are yellow, or Lion-tauny, and foolious Ternum. Istria and Liburnia yeefd sheep having wooll which is to course and rough, that it may rather feem to be hair then wooll, and therefore never fit for fine garments, nor for an other use, rather feem to be hair then wooll, and therefore never fit for fine garments, nor for an other use, except by the fingular art of fpinning in Portugal." And the like to this is, the wool of the Sheep of Piscene, and in Egypt, of which latter it is said, that if it be dyed again after it is thread hare, it will endure almost for ever. For the antients (as Homer writeth) had the "use hereof (although the thread were rough) in their works of Tapestry, and this was dressed divers waves, for the French in Empe

dreffe it one way, and the Parthians in Afia another way." The Sheep of Apillia gave the name to Lana Italica, for excellent wool, and yet was it short and course, good for nothing but for clokes to ride in, and wear in rainy weather: unto these I may add course, good for nothing but for closes to ride in, and wear in rainy weather; unto their hand the Calabrian, Miteflan, and Arentin an Sheep yet in the dayes of Parro they covered their sheep with other skins to keep the Wool both from loss, and other interior, to that it might be the better washed; dyed, and prepared, for these were nourshed most of all in house.

fields of Parma and Matina. The Sheep of Helveria feed in the tops of the Mountains, whiles the Goats keep beneath among the trees and gather fruits on the fides of the hils. The Flemmif Sheephave a

There be in general two kinds of Sheep, one called Tellum, the other Colonicum, as if you would fay house-sheep, and field sheep, for the Grecian Sheep which before we have called Tarintine, because of their soft wood, lived in houses, and they were also called Pelite, but the Sald Start heritage. but the field sheep having by nature a greater, courser, and rougher hair, are suffered to lodge a-

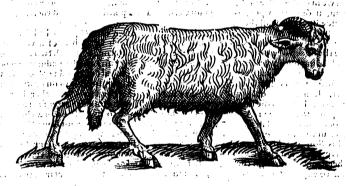

broad in the fields. Likewise the Sheep of Miletum and Attica, and the region Gadilonea, reaching to Armenia, have very fost and gentle wool, which thing seldom cometh to passe in Pontus, or Cappadoia. In Sectional Internal Lands of Cappadoia and Cap land allo in a place thereof, called by Heder Beothism Buthuguhania, are great flore of Sheep, bearing good wool, from whence almost all that Countrey fetch their breed. The Sheep of Eibiopia ber no wool at all, but in stead thereof their hair is rough like Camels hair: Amongst the Abident, and the Beudiani both Elianus and Nicomachus the Son of Ariffetle do testifie, that all their Sheep are black, and that there was never white Sheep bred in those Countries. In Gortynie their Sheep are red and have four horns: In the fortunate Islands of the red-sea all their Sheep are white, and none of them have crooked horns. In Bestie shere are four Rivers which work firange effects upon Sliceo after they drink of them; namely Melas, Capbylus, Penine, and Xambus. The Sheep drinking of Mela and Penius grow black, of Cepbilus white, and yet Pliny faith, that this River cometh forth from the fame fountain that Mela doth. They which drink of Xambu grow red : I might adde hereunto another special observation of difference between the Sheep of Pontus and Names, for in Pontus they have no gant; and in News they have two gants:

Of the Sheen

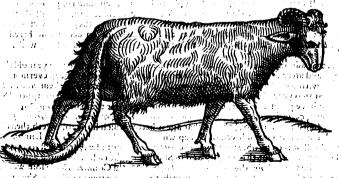

In fone parts of Indianter Sheep and Goats are as big as Affes, and bring fourth four Lambs at a time, but never lefs then three, both Sheep and Goats. The length of their tails reacheth down to their hinder-legs, and therefore the Shepheards cut them off by the fecreis; tothe intent that they may bester fuffer copulation, and our of them being fo cur off, shey capres sertain Ovis also they our sounder the tails of Rams , the ends whereof do afterwards close so nearly and naturally together, that there appeareth not any fear or note of the fection. In Syrin and India the tails of their Sheep are a gubit broaden better

There are two kinde of theep in Anahio, which are diffing hished by the length and breadth of their tails; the one fort have tails three cubits long, by reason whereof they; are non sufficient to draw them on the ground for fear of wounding; and therefore the shepheards devile corrain engins of wood to Support them: the other kinde of theep have tails like the Syrien theep All theep that live in hos and dry Regions have larger tails, and harfher wooll, but those that live in the moilt Regions and falt places, have fofter wooll and thorsen tails. There were two of the drahim Sheepbrought into England, about the year 1560. whole pictures were taken by Doctor Cay, and therefore I have expressed them here with their description.

The Arabian Sheep with a bread tail.

The Arabian Sheep with a long toil.

His Arabien Sheep (faid he) is a little bigger then our volger Sheep in England, but of the The descriptiame wooll, figure of body, and colour, only the thins, and fore-parts of their fage, are a on of the dree little red : the broad tail in the top was one cubit, but lower it was narrower, and like the biantheep. end of a vulgar Sheeps tail. They being brought on thip board into England, were taught through famine and hunger to eat not only grafe and hay, but field, fifth bread, cheefe, and butter-

1110

Herodotus faith, that fuch kinde of Sheep are no where found but in Arabia: the long tailed Sheep he calleth Marrokercos, and the broad tailed Sheep Plateukercos: yet Leo Afet faith, that these are of he calletn Matrogercos, and the broadcasted the state that million ab altis diffrimen eft; pretequam in caude the African Sheep, for thus he writeth i His arteithal million ab altis diffrimen eft; pretequam in caude the African Sneep, 101 titus ne willetin ter attention in tolde quam lauffimam circumferunt, que cuiq, quo opimior est, craffer obtigit, adio ut nominibile librat deceni, au vic quam laughmam circumjerum, que uniq, que uniq, que opamer en, current es no difference betwirt thefe Rams and other, except ginthendat, cum fua fronte impinguantur. There is no difference betwirt thefe Rams and other, except ginthendat, cum jua sponte impinguantur. I hart is in fatness groweth in breadth, for iff they fat of in their broad tail, which evermore as it grows in fatness groweth in breadth, for iff they fat of in their broad tail, which evermore as it grows in tailor one of their sheep have weighted ten or their own accord, it hath been found that the tail of one of their sheep have weighted ten or their own accord, it nath been found that the third where they cram and feed their Sheep with twenty pound, and not only there, but all o in Egypt, where they cram and feed their Sheep with Barly, Corn, and Bran; by which means they grow to fat, that they are not able to fir themselves, Barly, Corn, and Bran; by which means they grow to lat, that they are to the themelves, fo that their Keepers are forced to device little engins like childrens Carts, whereupon they lay their tails when they remove their Beafts; and the lame Leo Afen afficient, that he law in Easte their tails when they remove their beans, and the land and fifty mile from Alcair, a tail of one in a Town called Asima, standing upon Nilus, a hundred and fifty mile from Alcair, a tail of one of these Sheep that weighed sourcore pound, and whilest he wondred at it, scattery believing or these Sneep that weighte is were some present; that affirmed it to be an ordinary thing, for that which his eyes aw, the writeth; Sevidife qua femi ducentas librar expendifient: That is, they had they mad according as he withdred pounds : and except in the Kingdom of Tunis in Africk, and feen fome of them weight hundred pounds : teen tome or them weight a hundred point in all the world, and by it; it appeareth, that all the fit of Egypt, there are none such to be found in all the world, and by it; it appeareth, that all the fit of Reppr, there are none rather tails. Among the Garamants their Sheep eat fielh and milk, and it is their bodies goeth into their tails. their podies goeth into their tails Dienysim, Afer, and Verre do write, namely, that all Sheep were once wilde, and that the tame Sheep which now we have; are derived from those wilde Sheep, as once wilde, and that the tame onet, and therefore Varre faith, that in his days in Porigia therewere our tame Goats, from wilde Goats; and therefore Varre faith, that in his days in Porigia therewere flocks of wilde Sheep, whereof as out of Africk, and the Region of the Gadites, there were annually brought to Rome both males and females, of ftrange and admirable colours, and that his great Uncle prought to Aware Dott Hate and made them tame : But it appeareth that these wilde Sheepor Rams were bought divers of them and made them tame : bought givers or them and made them talls afterwards: For wilde Sheep are greater then the tame Sheep, Mulmons, of which we shall discourse afterwards: being swifter to run, fronger to fight, having more crooked and piked horns, and therefore many times fight with wilde Boars and kill them.

Oppianus.

Flocks of

wilde theep.

The Subm doth alfo appear to be a kinde of wilde Sheep, for after that Oppianus had discoursed of the Sheep of Creek, he falleth to make mention of the Subur, which he faith is of a very bright yellow colour like the Sheep of Greet, but the wooll thereof is not fo rough, it hath two large horns upon the fore-head, living both on the water and on the land, eating fish, which in admintion of it in the water gather about it, and are devoured, as we shall shew afterwards in his due place. The Co-In also spoken of before, and called Snake, seemeth to be of this kinde, for it is in quantity betwitt a Sheep and a Hart. It hath no wooll, and when it is hunted, the Hunters use neither Dogs nor other Beafts to take it, but terrifie it with ringing of little bels, at the found whereof it runneth to and fro diffracted, and fo is taken: And thus muth I thought good to express before the general nature of Sheep, of the divers and frange kindes in other Nations, that fo the studious Reader may nature or oneep, or the divers and triangle annear other tvations, that is the mappine account as admire the wonderful works of Gody as in all Beafts, fo in this, to whom in holy Scripturehe hath compared both his Son and his Saints; and for as much as their story to be mingled with the others, would have been exorbitant and far different from the common nature of vilgar Sheep, and fo to have been mixed amongst them, might have confounded the Reader: It was much better in my opinion to express them al together, and so to proceed to the particular nature of vul-

The feveral

parts of theep.

And first of all the description of their outward parts: the Sheep ought to be of a large body, that fo their wooll may be the more, which ought to be foft, deep, and rough, especially about the neck, shoulders, and belly, and those that were not so the ancient Gracians called Apoki, the Latines, Apife, that is, peild Sheep, for want of wooll, which always they did reject as unprofitable for their flocks: for there is no better figne, as Pliny faith, of an acceptable breed of Sheep, Quam crurium brevitat, & ventris vestitus. The shortness of the legs, and a belly well clothed with

The female to be admitted to the male after two years old. Till they are five year old they areaccounted young, and after feven unprofitable for breed. In your choice of Sheep evermore takethole which are rough with wooll even to their eyes, without any bald placeupon them, and those females which bear not at two year old utterly refuse, avoid likewise partly coloured or spotted Sheep, but choose them that have great eyes, large tails, and strong legs: let them be young also, and of breed, Nammelior est ca atas, quam sequitur spes, quam ea quam sequitur mors, & probata est progenies, si agmi solent Procreare formofor (faith Petrus Gresce.) that is that age is better which hope followeth, then that which death followeth: and it is a good breed of Sheep which bringeth forth beautiful Lambs. And toncerning their Wooll, it is to be observed, that the soft wooll is not always the best, except to thick withall, for Hares have fost but thin wooll, and in Sheep it ought to be contrary, and therefore the most fearful have the fostest hair, the Sheep of Southia in the cold Countries have soft wooll, but in Sauromatia they have hard wooll. Florentinus prescribeth, that the fine wooll of a Sheep is not surled, but standeth upright, for he faith, that curied wooll is easily corrupted or falfified.

The head of the Sheep is very weak; and his brain not fat; the horns of the female are weak if they have any at all, for in many places they have none, like Hindes, and in England there are both males and females that want horns: And again the Rams of England have greater horns then any other Rams in the world; and fometimes they have four or fix horns on their head, as hall been often feen. In Africk their male-fleep or Rams are yeared with horns, and also their females : and in Popus neither males nor females have ever any horns.

Of the Sheep.

Their eyes ought to be great, and of a waterish colour, and all Beasts that want hands have their eves standing far distant on their heads, especially Sheep, because they had need to look on both sides. and becaule they are of a simple and harmlele disposition, as we shall shew afterwards : for the lirtle eve, fuch asis in Lions and Panthers, betoken craft and cruelty; but the great eye, fimplicity and innocency. Their teeth fland in one continued row or bone, asin a Horse, but in the upper chap there are no loca-teeth a the male having more teach then the female.

There be jome that write, that Wirgit calleth Sheep Bidentes . Because they have but two teeth. but they do it ignorantly, for we may read in Servine; Nigidim and Monim, that Boars are called Bidenter, and all Beatte of two years old for they were first of all called Bidenner queft Bienner, by interpofittion of the letter. D. according to the other words, as we do not fay reire, but redire a nor reamare, but ridamere ; AONAFFIGHETE, but redarquere ; and fo Bidennis , for Biennis ; because facrifices were wont to he made of Sheep, when they were two years old. If ever it happen that a Sheep have but two teeth. it is held for a monther, and therefore a Sheep is called Ambidens, and Bidens, because he hath teeth both above and heneath. The bully of a Sheep is like the belly of a Beaft that chews the cud. The mik proceedeth from the ventricle or maw. The Rones hang down to the hinder-legs. The females have their unders between their thighes, like to Goats and Cows / fome of them have galls, according mato the ordinary custom of nature, and some of them have none at all, for in Pontus where by realon they gat, Wormwood they have no gall. Likewife in Geldit: fome we have shewed have two galls, and the Southien Sheep have galls at one time, and not at, another, as Alianu writeth, for he saith inthevery gold Countries when frow and winter covereth the earth, there Sheep have no galls, because they keep within doores, and use no change of meat, but in the Summer when they go abroad again to feed in the fields, they are replenished with galls.

There is a Region in Afra called Sopfie, wherein they fay their Sheep have little or no milts. The tems of a Sheep, are equal, and there is no Beaft that hath them covered with fat like unto it, Sheep are allo apt to grow exceeding fatty for in the year 1947, there was a fat Sheep given to the King of France in Pickardy, whereof the inward hoofs or cloves of his fore-feet were grown to be as long, as eight fingers are broad, the tops whereofe were recurved backward like the home of a walde Goat. Concerning their tails we have fooken already, for the vulgar Sheep have hairy tails like Foxes and Wolves. And thus much shall suffice to have spoken of their od o some star the Go as is no bear the star Inglish was a

inthenexa place we are to donfider the food and diet of Sheep, and then their inclination, and The food of the mulity that arifeth by them, and laftly the veral difeafes with their medicines and cures. It is fitution of therefore to be remembred, that the Ancients appointed frepheards to attend their flocks, and there frepheards we none of great account, but they were talled Shepheards, or Neatheards, or Goatheards, that is Bucolini. Opiliones, and Æpoli, as we have frewed afready in the flory of Goats: and the Genthe doreport, that the knowledge of feeding Oxen and Sheep came first of all from the Nymphs, who taught Ariffem in the Island of Co. The Gradians therefore call a shepheard Points, that is, a feeter, of Poimainein to feed; and the Poets alfo use Poimainer for a shepheard, and the shepheards Dogs, that keep the flock from the Wolf, Pominisay kunes, for the Sheep being not kept well, be overcome by the Woolfs, according to the faying of Virgil; and

Nam lupus infidias explorat ovilia circum,

And Ovid likewise saith:

Incustoditum captat ovile Lupus.

The whole care therefore of the Shopheard must be first for their food; secondly, for their fold; and thirdly, for their thealth, that so he may raise a profitable gain, either to himself or to him that oweth the Sheep. To begin with the food. Their diet doth not much differ from Goats, and yet they have some things peculiar which must now be expressed. It is good therefore, that their pastures and feeding places look towards the Sun-fetting, and that they be not driven over far, or put to too much labour: for this cause the good shepheard may safely feed his Sheep late in the evening, but not suffer them to go early abroad in the morning. They eat all manner of herbs and plants, and someuneskill them with their bitings, fo as they never grow more. The best is to give them always green meat, and to feed them upon land fallowed or ploughed to be fown with corn: and although by leeding them in fat pattures they come to have a lofter wool or hair, according to the nature of their food, yet because they are of a moist temperament, it is better to feed them upon the falt and fhort pasture : for by such a diet, they both better live in health, and also bear more prest

In dry pastures they are more healthy then in the fenny, and this is the cause why it is most wholefome for them to keep in ploughed grounds, wherein they meet with many fweet and pleafant herbs, or esse in upland medows, because all moisture breedeth in them rottenness: he must avoid the Woods and Thadowy places, even as he doth the fens, for if the Sun come not upon the Sheeps food, it is as hurtfull unto him as if he picked it out of the waters; and the shepheard must not think that

there is any meat fo grateful unto this cattle, but that nie and continuance will make them to loath it. there is any meat to grateral unto this cattlebut to give them falt oftentimes in the Summer when wherefore ne must provide this remess, in certain troughs in the folds, of their own accord they retarn from feeding, and if he do but lay it in certain troughs in the folds, of their own accord they will lick thereof, and it will encrease in them great appetite point of the continuous go

hey will lick thereor, and it will encrease in their gives a phen must be fed with the fostest hay, such as In the Winter time when they are never is less nourishable to them In fond Countries they is cut down in the Autumn, for that which is riper is less nourishable to them In fond Countries they is cut down in the Autumn, for that which is speaked, or Elm, three-leaved-grafs in the day up for themselves especially green Ewe leaves, or Elm, three-leaved-grafs in the day in the leaves of the second lay up for themielves especially green Eweleaves, or Link, they garlier their shafte or peafe, when other things fail : wherethere are flore of Vines, they garlier their layer chance or peate, when other things and very greedily, and I may fay as mich of the Olive for Sheep to eat thereor without an danger, and rety greenth, have more vertue in their to arind both wilde and planted, and divers such other plants, all which have more vertue in their to arind both wilde and planted, and divers luch any falt humor; and for this caufe the Sea-wormwood excelraile your peair it they be appeared with any select. And Myndius writeth, that in Portus the Sheep grow leth all other herbs or food to make fat Sheep. And Myndius writeth, that in Portus the Sheep grow leth all other herbs or rood to make the Succession of Beans encrease their milk and life Threeexceeding fat by the moit bitter and vulgar vvormwood. Deans entered their times and allo Three-leaved grafs, for that is most nourishable to the Bws: with young. And it is observed for the shall which in Latine is called Luxuria segetum, and in English ranckness of corn, there is no better temely which in Latine is called Luxuria segetum, and in English ranckness of corn, there is no better temely which in Latine is called Luxuria segetum, and in English ranckness of corn, there is no better temely then to turn in your Sheep in May when the ground is hard, if not before, for the Sheep lovely well to crop such stalks, and also the corn will thrive never the world; for in some places they say well to crop uch make, and and the total wall thrice, by region of the great fertility thereis it down twice, and in the Gountrey about Babylon thrice, by region of the great fertility thereis bouts, and if they should not do so, it would turn or run all into stalk and idle mid unprofitably bouts, and it they should not do to, it would take when they have exten Evines of the we have leaves. The same extasse is reported to follow Sheep when they have exten Evines of the we have leaves. The same extante is reported to follow that they all ftand ftill, and have to power to go expressed and in the rintory of Goats, manary, that they could their mouths. It is reported they they out of their pastures, till itheir Keeper come and take it out of their mouths. It is reported that they have out or their partites, the herb called Laferpitium, which first purgeth them, and then do fit then exceedingly : It is therefore reported that in Cyrine, there hath been none of this found for many exceedingly . It is the the Publicans that hire the passures are enemies to Sheep. For at the first eating years, because the rubhcans that line the patients and energing. In India, and especially in the Region of the Sheep will sleep, and the Goat will fall a neezing. In India, and especially in the Region of the Prasians, it raineth many times a dew like liquid Honey falling upon the herbs and graft of the earth: wherefore the shepheards lead their flocks unto those places, wherewithin their care the are much delighted, and fuch as is the food they eat, fuch alfois the take of the milk they rend der, neither need they to mingle Honey with their Milk, as the Gracian are contributed to do for the sweetness of that liquor faveth them of that charge. Such a kinde of dew the Hibitor call Min na; the Gracians, Aeromelos, and Drofomelos; the Germans, Himmelbung; and in Englife Honey der but if this be eaten upon the herbs in the month of May, it is very hurtful unto them. We have thewed already, that in some parts of Africk and Aubiopia, their Sheep eat flesh, and drink milk, and it is apparent by Philofratus, that when Apollonius travelled towards India, in the Region Propose, inhabited by the Orite, they fed their Sheep with fifthes, and so also they do among the Carmentan Indian which do inhabit the Sea-coafts: and this is as ordinary with them, as in Carla, to feed their Sheep with figs because they want grasain that Countrys; and therefore the flesh of the sheep doth tall of fish when it is eaten, even as the fiesh of Sea-fouls. The people of that Countrey are tilled limby. phagi, that is fifth-eaters : Likewife the Sheep of Lodia and Macedonia, their Sheep grow fir with eating of fifthes. Enim also writeth of certain fifthes about the bigness of Frogs which are given unto Sheep to be eaten. In Arabia in the Province of Aden, their Oxen, Camels, and Sheep, est fifties after they be dryed, for they care not for them when they be green : the like I might say of many other places, generally it must be the care of the shepheard to avoid all thorny and stony places for the feeding of his Sheep, according to the precept of Virgil;

> Si tibi lanicium cura, primum aspera silva Lappaq; tribuliq; abfint.

Because the same thing, as he writeth, maketh them bald, and oftentimes scratcheth their skin alunder, his words are thefe;

> Alterialista . Bergin chaire Turpis oves tentat scables . .1 and 5 m : Sudor, & birfuti fecuêrunt corpora vepres.

Although a Sheep be never fo found, and not much subject to the Pestilence, yet must the shepheard regard to feed it in choice places: for the fat fields breed frait and tall Sheep, the hills and short passures broad and square Sheep: the Woods and Mountain places, small and slender Sheep: but the best places of all are the plowed grounds. Although Virgil prescribeth his shep heard to feed his flock in the morning, according to the manner of the Country wherein he lived, for the middle part of the day was over hot, and not fit for cattel to eat in: yet other No. tions, (especially Germany and England and these Northern parts of the world) may not do fo. The whole cunning of shepheards is excellently described, for the ordering of their Sheep in the veries following:

Free omni fludio glaciem, ventofq; nivales Quominus eft illes cura mertalis egestas Guominus est illis cura mertalio egestas
Avertes: vidumg, seres, & virgea la tuo
Pabula: net tota claudes familia bruma.
As vero Lepbyr io cuim leta vocantibus est is
Infaliu utrumg; ergem asq. inpefera mittes.
Lucifet prima cum ladera frigila rura
Carponius: dum maine nevuem, dum granina canemi:
Es ros in tenera peteri gratissimus hecha est.
Inde, ubt quaria stimpent arbusta cicada:
Es cantu querula r timpent arbusta cicada:

Ad puteos, aut alta greges ad flagna jubeto Currentem illignis perare canalibus undam. Æstibus at mediu umbrosam exquirere vallem, Sicubi magna fovis antiquo topo e quercus Ingentes tendat ramos : aut ficubi nigrum Ilicibus crebi ja facta nemus occubes umbra. Tum tenues dare rui [us aquas : O pascere rur [us Solis ad occasium, cum frigidus aera vesper Temperat: & saltus resicit jam rosgida luna; Littoraqs halcyonem rejonant, & acanthida dumi.

The descripalon of a ficp. out of Vingil. ···· * Oves & ca-

When they return from their feeding, the thepheard must regard that he put them not into the folds hot, and if the time of the year be over hot, let them not be driven to passures a far off, but seed their in those which are near and adjacent to their folds; that so they may easily have recourse unthem in those which are near apparent to their rous? that of they may early, have recourse into the madow: they ought not also to be turned out clustering al together, but dispersed abroad
by little and little, neither miss they be milked while they are not, until they be cold a little, so like
which the morning, let them be milked so soon as day appeareth, and the little Lambs be turned out
which were short from them. But if there appear upon the grass Spiders webs, or Cobwood which bear up little drops of water, then they must not be suffered to feed in those places for fear of poyloning; and in times of heat and rain, drive them to the highest hille lor, pastures, which do most of all sie open to the windes, for there shall the cattle feed most temperately; They must avoidal andy places, and in the month of April, May, June, and July, they must not be suffered to fred overmuch, but in October, September, and November, let them have their full, that so they may grow the stronger against the Winter time. The Romans had a special regard to chuse some places grow the stronger against the Winter time. The Romans had a special regard to chuse some places for the Summering of their Sheep, and some place for their Wintering, for it shey summered them in Apulia, they wintered them in Apulia, they winter season are led forth to seeding, because the dewy grass of the morning in the Summer season are led forth to seeding, because the dewy grass of the morning wheth for they lead them to shadowy trees and rocks, until the cool air of the Evening beging to thun, at which time they drive them to their palture again, and cause them to feed towards with the string of the season of the season of the Sunfaint of the season of the Sunfaint with the Sunfaint with the season of the Sunfaint with the season of the Sunfaint with the Sunfaint w natures from the Sun. In the hot Countries a little before the Sun-fetting they water their Sheep, and then lead them to their passure again, for at that time the sweetness seemeth to be renewed in the will asked the tree of the form of the safet they do affect the Autumnal equinostium. It is good to feed them in corn fields after the safet they are exceedingly filled with such hearbs as they since affect the blongs, and allo they tread down the stubble, and doing the land, whereby it becomes more sufficiently against the next year. There is nothing that maketh a Sheep grow more fat this drink? and therefore we read in holy Seripture how Jacob watred the Sheep, and the Daughters of Jebro their Sheep, at what time Moser came unto other, therefore it is best oftentimes to make the with Salt, according to these verses;

the state of the s

There be many that trouble themselves about this question; namely, for what cause the Sheep of Thereston the bid of the trouble themselves about this question; namely, for what cause the Sheep of the bid of the first themselves are the world; informals that we think it are disconsisted in the first themselves are the first the first cause why, our Englishmer drink not think, for there is to high that Sheep had played drink; the true cause why, our Englishmer drink not drink, for there is to high that the Horrhern Sheep had no other water, and therefore Aristotherm. In Spalu this there is the first that the Horrhern Sheep had no other water, and therefore aristotherm. In Spalu this feel, the first feel for the first feel for water of water the Island of Orginiers are have shown the food of the Continue of the first feel for water of arising the sold sir; but in the shown the first of the first feel filling the cattle for water of arising the body of the first feel filling the first feel feel feel for water of a find in the sold sir; but in the shown the first feel and of great is the least about nine or ten a clock in the morning they water than Sheep and of great is the first feel filling in Sheep, that divers Authors, do report wonders there of the first feel filling in the filling is and when show will have then to bring forth black; they lead them to the River Alasmos; and when show all reported that the Kiver Transparder, doth maker all the Sheep to be yellow that drink thereof:

Pliny.

black, and the like I might add of the River Itrajes, of the two Rivers of Beolia, all which things black, and the mass in Burracle, but also by the power of nature, as may appear by the History of Jacob, when he ferved his father in law Laban.

For after that he had covenanted with Laban, to receive for his stipend all the spotted Sheep, the For after that he had covenanted with a subject took rods of green Poplar, and of Hafel, and of the Chef. Scripture faith in this manner: Then Jacob took rods of green Poplar, and of Hafel, and of the Chef. Scripture faith in this manner: Iven jacob 100k 1001 of green again, in the rods. Then be put the follow tree, and pilled whitt frakes in them, and unde the white appear in the rods. Then be put the follow which be bad pilled into the guiters and watering troughs, when the Sheep came to dink, before the which is and the sheep came to dink, before the Sheep, and the Sheep were in heat before the rods, and afterwards brought forth young of party colour, and Sheep, and the sheep came to the sheep came to the sheep came to the sheep when the sheep came to the sheep ca

Sheep, and the oneep were in weat before the roat, and mind the faces of the flick towards with small and great spots. And Jacob parted these Lambs, and turned the faces of the flick towards with small and great speet. And successful these professions of Laban, so be put his own slock to these party-coloured Lambs, and all manner of black among the She p of Laban, so be put his own slock by these party-coloured Lamos, and all manner of some And in every Ranming time of the stronger Sheet, lathernselves, and put them not with Labans flock. And in every Ranming time of the stronger Sheet, lacob layed the rods before the eyes of the Sheep in the gutters, that they might conceive before the rods, but when the Sheep were feeble be put them not in , and fo the feebler were Labans, and the fronger were Jacobs, the Sheep were recove as you were the start arch, acob, it is clear by testimony of holy Scripture, that divers Upon this action of the rathartin jates, it is clear by contaction, do cause them to bring forth colours laid before Sheep at the time of their carnal copulation, do cause them to bring forth fuch colours, as they fee with their eyes: for fuch is the force of a natural impression, as wered in flories, that fair women by the fight of Blackamores, have conceived and brought forth black in stories, that ian women by the black and deformed women have conceived fair and bequichildren, and on the could be no other reason given in nature, but their only cognation ful children; whereof there could be no other reason given in nature, but their only cognation of and upon fair beautiful men, or black and deformed Moores, at the time of their carnal coon.

So that I would not have it seem incredible to the wife and discreet Reader, to hear that the lation. power of water should change the colour of Sheep: for it being once granted, that nature can bring forth divers coloured Lambs, being holpen by artificial means, I fee no caufe, but diversity of waters may wholly alter the colour of the elder, as well as whited flicks ingender a colour in the younger: And thus much shall suffice to have spoken concerning the Summering of Sheep. For their Wintering I will say more when I come to entreat of their stabling or housing.

Now then it followeth in the next place to discourse of copulation or procreation; for there are divers good rules and necessary observations, whereby the skilful shepheard must be directed, and which he ought to observe for the better encrease of his flock. First of all therefore it is clear, that Goats will engender at a year old, and sometime Sheep also follow that season, but there is a difference betwirt the Lambs fo engendered, and the other that are begotten by the elder: therefore at two year old they may more fafely be suffered to engender, and so continue till they be five year old, and all their Lambs be preserved for breeding; but after five year old their strength and patent vertue decreaseth, so that then neither the Dam nor the Lamb is worthy the nourishing, exceptor the knife, for that is born and bred of an old decayed substance, will also resemble the qualities of

There be some that allow not the Lamb that is yeared before the parents be four year old and to they give them four years to engender and breed namely till they be eight year old, but after eight years, they utterly cast them off : and this opinion may have some good reason, according to the quality of the Region wherein they live, for the sooner they begin to bear young, the sooner they give over; and herein they differ not from Cows, who if they breed not till they be sour year old may continue the longer, and for this cause I will express the testimony of Albertu, who writeth thus: Over parere usqs ad annum offavum possint, & si bene curentur vel in undetimen fecultus partendi protranitur, qued tempus est tota fere vita, over in quibusdam tamen terri merini un successiones & Jalja habent pascua vivunt per viginti annos & pariunt. That is to fay, Sheep may breed until they be eight year old, and if they be well kept until they be eleven, which time is for the most part the length of their days, although in some Countries upon the Sea coasts, they live till they be twenty year old, and all that time breed young ones, because they feed upon dry and falt pattures, and therefore Ariffolle alfo faith, that they bring forth young ones all the time of

The time of their copulation, as Pliny and Varro write, is from May till about the middle of August, and their meaning is, for the Sheep of those hot Countries. For in England, and other places shepheards protract the time of their copulation, and keep the Rams and Buyes shinder, till september, or Ottober, because they would not have their Lambs to fall in the cold Winter sealon, and the cold winter sealon. but in the Spring and warm weather: and this is observed by the ancient sheeping that if the strongest Sheep do first of all begin to engender and couple one with another, that it cheeping that it the strongest Sheep do first of all begin to engender and couple one with another, that it between the very happy and fortunate year to the flock but on the contrary. If the younger and meter sheep be first of all stirred up to lust, and the elder be backward and slow, it prelageth a pellient and

They which drink falt Water are more prone to copulation then others, and commonly at the third or fourth time the female is filled by the male. There is a great similitude and likeness the twixt Sheep and Goats. First, for their copulation, because they couple together at the fine time. Secondly, for the time they bear their young, which is five moneths, or a hundred and fifty days: also many times they bring forth twins like Goats, and the Rams must be alway to admitted as the Lambs may fall in the Second of the Country o mitted as the Lambs may fall in the Spring of the year, when all things grow sweet and green; and

when all is performed, then must the males be separated from the semales again, that so all the time they go with young, they may go quietly without harm.

In their conception they are hindered if they be over fat, for it is with them as it is among Mares and Horses, some are barren by nature, and others by accident, as by overmuch leanness or overmuch fatnels. Plutar.b maketh mention of an ancient custome among the Gracians, that they were wont to drive their Sheep to the habitation of Agener, to be covered by his Rams: And I know not whether he relate it as a ftory, or as a Proverb to fignifie a fruitful and happy Ramming time I rather incline to the later, because he himself saith in the same place, that regenor was a wise and skilful King, Master of many flocks, whose breed of Sheep was accounted the best of all that Nation and therefore either they fent their females to be covered by his Rams, or elfe they fignified a happy conjunction of the Rams and Ewes together. Pluny writeth, that if the right stone of a Ram be tyed Means to make or bound fast when he leapeth upon an Bwe, he will engender a male, but if the left stone be tyed; he the Ramsget

Near the City Paire there are two Rivers, one of them called Miliebus and the other Gearadrus, and males, the Cattle that drink of this water in the Spring time, do beget males, and therefore shepheards when they bring their Sheep and Goats to that River, they drive then to the farther fide of the River, because they would have more semales then males: for that vertue lyeth in one of the fides, but their Kine they fuffer to drink on that fide, because among their heards the male is best for Bulls and Oxen lerve them for facrifice, and to till the earth, and therefore the male in that kinde, but in all other the semale is more acceptable.

Both males and females are begotten as well by the vertues of waters, as by the vertue of the Rams, and likewise by the vertue of the winde: for when the North winde bloweth for the most part males are conceived, but when the South winde females: and therefore Aiffolle faith: In ad's milling timpore objervare siccis diebus habitus septentrionales, ut centra ventum gregem pascamus, & curs petiant eduntiatur pecus, at si særinæ generande sunt, austrinos status captare, ut eadem ratione matrices meaniur. That is to say, In the Ramming time you must observe the blowing of the Northern winde in dry days, and not only seed the slock against the winde, but also cause the Run to leap the Ewe with his face to the North : but if you would engender semales, then must you in like manner observe the South winde. Unto this experiment do Palladius, Ælianus, and Columella agree, and these things are necessary to be observed about the engendering of

Now after that the Ewe is filled by the Ram, the diligent shepheard must have as great regard wkeep her from abortment, or casting of her Lamb : therefore Ariffoth faith, if presently after copulation there fall a showre, or if when they are great with young they eat Wallnuts, or Acorns, they will cast their Lambs: and likewise if in time of Thunder the Ewe with young be alone in the field, the claps of Thunder will cause abortment; and the remedy thereof, for the avoiding of that mikher, is prescribed by Piny: Tonit-us (saith he) solitariis ovibus abortus inserunt, remedium est con-gigat em ut coitu juventur, that is, to call them together in times of Thunder, is a remedy against abortment. Therefore he requireth of a skilful shepheard a voice or whissel intelligible to the Sheep, whereby to call them together, if they be scattered abroad feeding, at the first appearance and note of thunder. It is also reported, that there are certain veins under the tongue of a Ram, the colour whereof do presage or fore-shew, what will be the colour of the Lamb begotten by them: for if they be all white, or all black, or all party coloured, such also will be the colour of it that

Ewes bring forth for the most part but one at a time, but sometimes two, sometimes three, and The yearing sometimes sour, the reason whereof is to be attributed either to the quality of the food whereof of Lambs. they eat, or elle to the kinde from which they are derived : For there be certain Sheep in the Or- Bathius. cades, which always bring forth two at one time, and many of them fix. There are also Sheep in blagnetia, and Africk, that bring forth twice in the year: And Ariffule in his wonders writeth, that the Sheep of Umbria bring forth thrice in a year, and among the Illyrians there are Sheep and Goats, that bring forth twice in the year, two at a time, yea sometimes three, or sour, or five, and that they nourish them all together, with their abundance of milk, and besides some of their milk is milked away from them. Egypt is so plentiful in grass, that their Sheep bring forth twice in a year, and are likewise twice lipped : so likewise in Mesopotamia, and in all moist and hor Countries.

Many times times it falleth out, that the Ewe dyeth in the yearing of her Lamb, and many times Albertus. they bring forth monsters : so also do all other Beasts that are multipara: betwixt a Goat and a Ram, 15a Mulmon begotten, and betwixt a Goat-buck and an Ewe is the Bealt Cinitus ingendered; and among the Rheitans many times there are mixed monsters brought forth, for in the hinder-parts they are Goats, and in the fore-parts Sheep: for Rams when they grow fitrong, old and wanton; leap upon the female Goats, upon which they beget such monsters, but they die for the most part immediately after the yeaning.

Sometimes wilde Rams come to tame Sheep, and beget upon these Lambs, which in colour and wooll do most of all resemble the father, but afterward when they bear young, their wooll be-Sinneth to be like to other vulgar Sheep: when the Ewe is ready to be delivered, fhe tra-Vaileth and laboureth like a Woman, and therefore if the shepheard have not in him some Midwives skill, that in cases of extremity he may draw out the Lamb when the members stick

Aristotle. Albertus.

Helps for the Sheep.

Of the Sheep.

cross in the matrix, or else if that be unpossible, because it is dead in the dams belly, yet to cut it out without peril and danger to the Ewe, in such cases the Gracians call a shepheard Em.

Caffody of Ewes and young Lambs encrease their milk.

Having thus brought the Sheep to their delivery for the multiplication of kinde, it then refleth to provide that the new born Lamb may be secured from Dogs, Woolfs, Foxes, Crows, Ravens, and all enemies to this innocent Beaft, and also to provide that the Ewe may render to her young one fufficient food out of her udder; therefore they must be well and extraordinarily fed. We have shewed already the use of Salt, and then also it is very profitable when the Bwe is newly delivered of her Lamb, for it will make her drink and eat more liberally. In the Winter time for the encrease of their milk, in flead of green paffures, and fuch other things as we have expressed, it is requisite to give them corn, and especially plenty of Beans.

For this cause some prescribe to be given unto their Sheep the herb Lanaria, which they affirm to be profitable to be given to encrease milk; somethe stone Galacites to be beaten to powder, and anointed upon the Ewes udder; and some prescribe to sprinkle water and salt upon them every

morning in the house or field, before the Sun rifing. But herein I leave every man to his own judgement, hoping it will not be offenfive to any, to relate those things before expressed, and resting in opinion, that both the food that is received inwardly, and also the Ointments that are applyed outwardly, will be sufficient means to procure abundance of milk in the Summer and Winter seasons.

Of the winterbling of ficep.

Palladius.

Pet. Crefcent.

Now therefore it followeth to entreat likewise of the Wintering of Sheep, for as there is more cost to keep them in cold weather then in warm, fo it doth require at our hands some discourse thereof. Then it behoveth you to provide for them warm folds and stables, whereof the Poet writeth in this manner:

> Incipiens, stabulis edico in mollibus berbam Carpere oveis, dum mose frondosa reducitur aftas : Et multa duram stipula filicumque maniplis Sternere subter humum; glacies ne frigida lædat Molle pecus scabiemq; ferat, turpeisq; podagras.

Whereby it is evident that the cold Winters do beget in Sheep divers and many disastes, and for that cause it was the counsel of a wife and learned man, that our Sheep should not be turned out to feeding neither in cold or warm weather, until the frost were dissolved and thawed from off

the grass and earth.

The Tarentine, Gracian, and Afian Sheep, were wont to be altogether kept in stables within doors, lying continually upon plancks and boards bored through, that so their precious fleeces might be the better fafe-guarded from their own filth and urine; and three times in the year they let them out of their stables, to wash them and anoint them with Oyl and Wine : and to save them free from Serpents, they burned in their stables, and under their cratches, Galbanum, Cedar-wood, Womans hair, and Harte-horns: and of these Tarentine and Gracian Sheep, Columella writeth in this manner: It is in vain for any man to store himself with those Tacentine Sheep, for they ask as much or more attendance and costly food then their bodies are worth; for as all Beasts that bear wooll are tender, and not able to endure any hardness; so among all Sheep, there are none so tender as the Tarentine or Grecian Sheep, and therefooe the Keeper of them must not look to have any playing days, nor times of negligence or fluggiffines, and much less to regard his covetous minde, for they are cattel altogether impatient of cold, being feldom led abroad, and therefore the more at home to be fed by hand; and if by covetouinels or negligence, one withdraw from them their ordinary food, he shall be penny wife, and pound foolish: that is, suffer a great loss in his cattel, for

Every one of them all the Winter long, were fed with three pintes of Barley or Peafe, or Beans three times a day, befide dryed Ewe-leaves, or Vine leaves, or Hay late mown, or fitches, or chaft. Besides there cannot be any milk taken from the dams, for at the first yearing there is no morethen to ferve the little or least Lambs, and after a few days, even while they smell and take of their dams belly, they were to be killed for want of fuck, that every Lamb which was to be preserved for breed might have two dams or Ewes to fuck, and fo the poor Ewe was forced to a double miferie; firsto loofe her young one, and afterward to lend her paps and milk to a ftranger. And moreover, they were forced to nourish more males then females, for that at two year old they were gelded or killed, to sell their beautiful skins to the Merchant, for their wool was most pretious, by reason that never or seldom than went change and an arrangement of seldom than went change and an arrangement of seldom than went change and arrangement of seldom than went change and arrangement of seldom than went change and seldom than went change and seldom than went change and seldom than the or feldom they went abroad to the fields. Their custody in the house from Serpents and other anyonances, is thus definited back.

novances, is thus described by the Poets:

faving from them a little meat.

Difce & odoratam stabulu incendere cedrum Galbaneoq; agitare graves nidore chelydros. Sape sub immotis prasepibus, aut mala tallu Vipera delituit, calumq; exterrita fugit, Aut tello affuetus coluber .-

In confideration whereof s and of all the pains about the houting of these render Sheep, the Poet teacheth the shepheard or Sheep-master to kill the Serpents, and dash out the brains of inakes. faying:

Cape Sama manu; cape robora pastor Tollentemq; minas, & Sibila colla tumentem :.

Concerning the ancient forms of their Sheep-stables, I finde this to be recorded by the ancients. The fashion of First, they made them low and not of any high or losty building, so thretching them out in length, these coats or and not in height, that it may be warm in the Winter time, for although there be no creature bet. flables. ter cloathed by nature then a Sheep, yet is there not any more impatient of cold, nor more apt to take harm thereby. It must not be over-broad, yet so as the Ewe and her Lamb may lie both together, and the breathing place not left open at the top of the house or the sides, for that will let in too much air, but at the door or porch of their entrance, and that very low, that fo the fresh air may quickly and easily come to their low heads and bodies, and also their breath the beeter avoid out or the Hable.

They also had a care to cover all the floor with straw or dry boared boards, or some such other matter, whereby they might stand continually dry and warm, and also clean and sweet, to the end they might not be annoyed in their own frandings; and therefore the floor was made flielving or falling low on the one fide, or elfe of hurdles like baskets to let out their urine, for they often make water : and these were often changed, cleansed, and turned. In this stable there ought to be divisions or partitions wherein in time of necessity and sickness, they may easily abide alone and be parted from the residue, and feed without annoyance of one another, and especially that one may not ride another, and during the time of the Winter, they did not let their cattel drink above oncea day.

And these were the cures of the Ancients about their flocks of Sheep. For upon them they The manner lived, they bought and fold, and herein also it is profitable to observe the ancient manner of their how incld bargains about these creatures: for when a man came and bought Sheep, he made this protestation bought and to the feller : Tanti funt mibi empta? To whom the feller answereth, funt: Then the buyer draweth fold sheep. his mony with these words; Sie illase oves, qua de re agitur, sanas telle effe uti pecus ovillum, quad relle samm est, extra luscam minam s. ventre glabro, neg; de pecore morboso esse, babereg; relle licere: hac si relle fieri respondes ? 🕳 e.

First, the Buyer faith. shall I buy these Sheep for thus much money? and so draweth his money, to whom the Merchant or feller answereth, you shall : Then faith the chapman or buyer again to hm, Do you promife to me, then that these Sheep are as sound as Sheep should be, without fault of winde or limb, without blindeness, without deafness, without pield bellies, not coming out of any infected flock; and fo as it shall be lawful for me to injoy them without all mens contradiction, lithelethings be true, then I will firike up the bargain: and yet doth not the feller change the property of his Theep, nor lofe his Lordship over them until the mony be paid. And hereupon it cometh to pais that the buyer may condemn the feller, if the cattel be not fo good as his bargain, or if he do not deliver them; even as the buyer is subject to the same judgement, if he do not deliver the price. And concerning thepheards, and cuffody of flocks I may adde a word or two more: First of

all for the number of the Sheep, how many may fafely be kept in every flock.

There is no need that I should give any rules about this business, for the Ancients were wont to The general fet one thepheard over a hundred rough or course woolled Sheep, and two shepheards over a hundiscipline of dred fine woolled Sheep: the common flocks were feaventy, or fourfcore, and the shepheard firepheards. that followed them, was charged to be both vigilant and gentle, and therefore his discipline was: Duti propier effe quam domino, & in cogendie, recipiendifque ovibus, adclamatione, ac baculo minetur, nec unquam telum emittat, neque ab his longius recedat, nec aut recubet, aut concidat, nam hist procedit, Stare debet, gwoniam grez quidem custodio officium sublimem celsissimamos oculorum, veluii speculam, desiderat, ut nege ladiores, O gravidas dum cuntiantur, nega agiles & fortas dum procurrunt, separati à cateria finat ; ne fur aut flia ballucinantem pastorem decipial , faith Collumella : He must rather be a guide unto them then a Lordor Master over them, and in driving them forward, or receiving them home after they have fragled, he must rather use his chiding voice, and shake his staffe at them, then cast either stone or dart at them : neither must be go far from them at any time, nor sit down, but stand still, extept when he driveth them, because the flock desireth the direction of their Keeper, and his eyelikea lofty watch-tower, that so he suffer not to be separated a sunder, either the heavy Ews great with young, because of their slow pace, nor yet the light and nimble ones which give suck, and are delivered of their young, which are apt to run away, lest that some ravening beatt or thief deceive the lottering shepheard by taking away from him the hindmost or formost. There may also be more in a flock of Sheep then in a flock of Goats, because the Goats are wanton, and so disperse themselves abroad, but the Sheep are meek and gentle, and for the most part keep round together: Yet it is better to make many flocks then one great one, for fear of the pessilence.

In the flory of the Dogs we have shewed already, how necessary a shepheards Dog is to the flock to defend them both from Woolfs and Foxes, and therefore every shepheard must observe thole rules there expressed, for the provision choice, and institution of his Dog; and to conclude this discourse of the shepheard, when the Lambs are young he must not drive their dams far

The History of Four-footed Beasts.

to patture, but feed them neer the Town, Village or House, and his second care must be to pick and cull out the aged and fick Sheep every year, and that in Autumn of Winter time, left they die and infect their fellows, or left that the whole flock do go to decay for want of renewing and and inject their removes, or reference whose full regard that when one is dead, he supply the place with one or two at the leaft, and if he chance to kill one at any time for the houshold, the counfel of Antiphanes is profitable to be followed; Illas tantum maltare debes oves ex quibus nullus amplius frudus, vel cafei vel velleris, vel lacile, vel agnorum perveniet. That is, to kill those Sheep from whom you can never expect any more profit by their Lambs, Milk, Cheefe, or Fleeces.

Of the diseases of Sheep, and their causes in general.

Of the difeases TN the next place it is necessary for the wife and discreet shepheard to avoid all the means whereby the health of his flock should be indangered, and those are either by reason of their meat and food that they eat, or else by reason of natural sicknesses arising through the corruption of bloud. and the third way is by the biring of venemous beafts, as Serpents and Wolves, and fuch like; and fourth way, scabs, Gowts, swellings, and such like outward diseases.

of venomous meats or herbs unto Sheep.

Here is an herb which the Latines call Herba Sanguinaria, Pilosella, Numularia, and by the Germans and English cald Fenugreek, and by the French because of the hurt it doth unto Sheep, they use this circumscription of it : L'berbe qui tue les brebis, The herb that destroyeth Sheep. It is called also Serpentine, because when Snakes and Adders are hurt therewith, they recover their wounds by eating thereof, when a Sheep hath eaten of this herb, the belly thereof twelleth abundantly, and is also drawn together, and the Sheep casteth out of his mouth a certain filrhy spume or froath, which smelleth unfavourly, neither is the poor beast able to escape death. except presently he be let bloud in the vein under his tail next to the rump, and also in the upper lip. yet is this herb wholesome to all other cartle except Sheep alone; wherefore the Shepheards must diligently avoid it. It is a little low hearb, creeping upon the ground with two found leaves, not much unlike to Parsley, it hath no savour with it, or smelleth not at all, the flower of it is pale and imelleth ftrong, and the ftalk not much unlike the flower. It groweth in moift places, and near Hedges and Woods.

If in the Spring time Sheep do eat of the dew called the Hony-dew, it is poylon unto them, and they die thereof : Likewife canes in the Autumn do make their belly swell unto death, if they drink presently after they have eaten thereof, for that meat breaketh their guts afunder. The like may be faid of Savine, Tamarisk, Rhododendron, or Rose-tree, and all kindes of Henbane.

The female Pimpernel doth likewise destroy Sheep, except assoon as they have eaten of it, they meet with the herb called Ferus-oculus, Wilde-eye; but herein lyeth a wonder, that whereas there are two kindes of this herb, a male and a female, they should earnestly defire a male, and eagerly avoid a female, feeing that both of them have the same taste in the palat of a man, for they taste like the raw roots of Beets.

There is an herb in Normandy called Duna, not much unlike Rubarb, or great Gentian, but narrower leaves, and standing upright, the nerve whereof in the middle is red, and it groweth about the waters, and therefore I conjecture it may be Water-forrel, or Water-planton, whereof when Sheep have caten, they fall into a disease called also Duna, for there is bred in their liver certain lit. tle black Worms or Leeches, growing in small bags or skins, being in length half a finger, and so much in breadth, wherewithall when the Beaft is infected, it is uncurable; and therefore thereis no remedy but to take from it the life : and that this is true, the Butchers themselves affirm, how many times they do finde such little worms in the Sheeps liver, and they fay, they come by drinking of Fenny or Marshy-water. And to conclude, there is a kinde of Pannick also, whereof when Sheep have eaten it deltroyeth them, and there be other herbs which every common thepheard knoweth are hurtful unto Sheep; and the Beaft it felf, though in nature it be very fimple, yet is wife enough to chuse his own food, except the vehement necessity of famine and hunger causeth him to ext poyfoned herbs.

In cases when their bellies swell, or when they have worms in their belly which they have devoured with the Herbs they eat, then they pour into their bellies the urine of men, and because their bellies presently swell and are pussed out with winde, the shepheards cut off the tops of their ears, and make them bleed, and likewife beat their fides with their staff, and so most commonly they are recovered. If Sheep chance to drink in their heat, so as their grease be cooled in their belly, which Butchers do sinde many times to be true, then the sheepheard must cut off half the Sheep and if it bleed the Book Call bear and it bleed the ear, and if it bleed the Beaft shall be well, but if it bleed not, he must be killed and eaten, or ele he will starve of his own accord. If at any time a Sheep chance to devour a leach, by pouring in Oyl into his throat, he shall be safe from danger.

. D raid for all refer. Of the Colds of Sheep.

tinia as Of the Sheep.

CHeepare known to be subject to cold, not only by coughing after they have taken it, but also by their strength before they take it; for the shepheards do diligently observe, that when any frost or ice fallest upon a Stieep; wif he endure it, and not shake it off, it is a great hazard but the fame Sheep will die of cold, but if he thake it off, and not endure it, it is a fign of a firong, found and healthy constitution and Likewise for toknow the health of their Sheep; they open their eves. and if the weins appear red and small, they know they are found; but if they appear white, or else red and full; they know they are weak, and will hardly live out Winter or cold Weather : also when they are raken in their hands, they prefs their back bone near the hips, and if it bend not they are found and firong, but if they feel it bend under their hand, they hold them weak and feeble; Likewise if a man take them by the head or by the skin of the neck, if he follow him easily when he draweth him, it is a fign of weakness and imbecillity, but ifit doth itrive, and follow with great difficulty, then it is a token of health and foundness.

culty, then it is a token of health and foundness.

The true original of Scabi is either as we have faid already, leanness or else cold, or wet, or The original wounds in the fielh by clipping or to conclude, by the hear of the Bealt in Summer not wathed cause of scale. off, by thorns and prickings of bushes, or by sitting upon the dung of Mules, Horses, or Asses, Now when this first of all beginneth, it is easterfor, the shepheard to observe by these signes and tokens, for the tickling or itching humor, lying betwixt the skin and the flesh, causeth the poor Sheep either to bite the place with his teeth, or to foratch it with his horn, or to rubit upon a tree or wall, or if he cando none of thefe, flamp hard upon the ground with his fore-feet, for which it is good presently to separate the Sheep so affected from the flock. The description and cure whereof is thus expressed by Wirgil: wie he may be a minimum to

which may be Englished in this manner: When the poor Sheep through wet showers, cold Winter, Summers sweat, or pricking of thorns, doth incur the filthy disease of scabs, then it concerneth his mafter to wash him in sweet Rivers over head and ears, yea to cast him in to swim for his own life, or eleto anoint his body after it is clipped with the spume or froth of Oyl, and of Silver with Brimflone, and foft Idean Pitch, with Wax, Hellebore, Black-earth, or the flesh of Shrimps; or if it be possible to cut off the top of the wound with a knife. the Residence of the ending of the

Of the Scabs of Sheep, the first remedy.

"His disease the French men call Letac, and of all other it is one of the most contagious, for our English proverb justifieth's one scabbed Sheep infecteth a whole flock, and Textor writeth thus of it; Over frequentius quam ullum aliud animal infestantur scabie, quam facit macies, ut mattem inopia cibi, buic morbo nist occurratur unica totum pecus coinquinabit, nam oves contagione vexantur. That is to say, Sheep are more oftentimes infected with scabe then any other creature, whereinto they fall through leanness, as they fall into leanness through want of food; and therefore if a remedy be not provided for this evil, one of them infected will defile all the refidue, for Sheep are subject to contagion: for remedy whereof in France they use this medicine : First of all they shear the Sheep, and then they mingle together the pure froath of Oyl and water; wherein Hops have been fod, and the kes of the best Wine, and so let it soak in two or three days together; afterwards they wash them in Sea water, and for want of Sea water in falt water; and this medicine is approved, whereby both sand tikes are removed from the Sheep, and also the wooll groweth afterwards better then event did before; but it is better if a man can cure them without thearing then by thearing, as Vem writeth; and furthermore to wash Sheep oftentimes with this medicine, doth preserve them from feabs before they be infected : and others adde unto this medicine little flicks of Cypresswood foked in water, and fo wash them therewith; some again make another medicine of Sulphure or Brimstone, Cypress, white Lead and Butter, mingled all together, and so anoint their Sheep therewith. Some again take earth which is as foft as dirt, being fo fortned with the stale of an Ale, but evermore they shave the scabbed place first of all, and wash it with cold or stale urine, and generally in Arabia they were never wont to use other medicine then the gum of Cedar, wherewithall they purged away by Ointment all feabs from Sheep, Camels, and Ele-

Of the Sheep.

477

phants: but to conclude, there is no better medicine for this evill then Urine, Brimstone and Oyl as Diophones Writeth.

Another medicine for the Scabs.

Ake the less of Wine, the froath of Oyl, white Hellebore mingled with the liquor of fod Hops, also the juyce of green Hemlock, which is expressed out of the stalk before it hath feed, after it is cut down and outlinto an earthen vessel with any other liquor mingled, with seed, after it is cut down and put line and an antiped, with feorched falt, fo the mouth of the wester being made up close, fet it in a dunghill a whole year torched lait, 10 the mouth of the watch the vapour of the dung, then take it forth, and when you together, that fo it may be concorted with the vapour of the dung, then take it forth, and when you will use it, warm it, first of all scraping the ulcerous or scabbed part with an Oyster shell, or elle with a sharp pumice stone, untill it be ready to bleed, and so anoint it therewith:

Another medicine of the fame.

Take the froath of Oyl fod away to two parts, I mean three parts into two, put thereinto the fale urine of a man, which hath been heated by casting into it hot burning Oyster shels, and mingle a like quantity of the juyce of Hemlock, then beat an earthen pot to powder, and infuse a mingie a like qualities of fived or feorched falt, all which being preferved together, do pinte of liquid Piech and a pinte of fryed or feorched falt, all which being preferved together, do cure the scabs of Sheep so often as they are used. ेक मैच्या स

Another medicine.

gought see althogoddau is

A Drink being made of the juyce of Hops, and the herb Chamælion, and given unto them cureth them. Likewife the same being sod with the roots of black Chamælion, and anointed warm upon the place, according to Diofeorides, have the fame operation: Likewife Pin writeth, that warm upon the place, according to Spirit water alone, either taken out of the Sea, or made by art, and the scabs of Sheep may be cured by falt water alone, either taken out of the Sea, or made by art, and for a funch as there is great danger in the decoction thereof, left that the water overcome the falt, or the Salt overcome the water, he prescribeth a mean how to know it, namely the equal and just temperament thereof, for (faith he) if it will bear up an Egge then it is well tempered; fo that the Egg will swim and not fink, which you shall find by addition of equal, and just quantity of water and Salt, that is, two pintes of water, a pinte of Salt, and so less to less, and more to more But if there be any bunch or great scab which covereth any part of the skin, then open the stable and built, and pour into it liquid pitch and scorched sale; and thus much for the disease of the scabs problem.

Of the Holy fire which the Shepheards call the Pow, or the Blisters, or Saint Anthonies fire.

'Mis evill is uncurable, for it neither admitteth medicine nor refecation by knife, and therefore whenfoever a Beaft is infected therewith, it ought presently to be separated from the refidue of the flock, for there is nothing that spreadeth it self, more speedily : whealoever you adventure to apply any thing unto it, it presently waxeth angry, and perplexeth the whole body except it be the milk of Goats, and yet my Author speaketh thus of it : Quod infusium velet, ut blandtatur, igneam sevitiam, different magin occisionem gregis, quam probibens. That is, It seement to close with raging fire, as it were to flatter it a little, rather deferring the death of the Bealt, then doing away the disease. It is therefore prescribed by the most memorable Author of all the Egythans, that men do oftentimes look upon the backs of their Sheep to fee the beginning of this fickness, and when they finde a Sheep affected herewith, they dig a ditch or hole fit for him at the entering in of the Sheep coat or stable, wherein they put the Sheep alive with his face upward and back downward, and cause all the residue of the flock to come and piss upon him, by which adion it hath been often found (as Columella writeth) that this evil! hath been driven away, and by no other means.

of the Warts, and Cratches of Sheep.

His disease is called by the vulgar shepheards the Hedghog, and it doth annoy the Sheep two manner of ways; First, when some gauling or matter ariseth upon the paring of the hoof, or elfe a bunch arise in the same place having thair growing in the middle like the hair of a Dog, and under that a little worm, the worm is best drawn out with a knife, by cutting the top of the wound, wherein must be used great wariness and circumspecteion, because if the worm be cut asunder in the wound, there issueth out of her such a venemous pussulate matter, that poysoneth the wound, and then there is no remedy but the foot must be cut off. But the wound being opened, and the wom taken out alive, prefently with a Wax-candle you must melt into it hot burning fewer, and if therebe no bunch but only scabs, take Allum, liquid Pitch, Brimitone, and Vinegar, mingled all together, and apply it unto the wound, or elfe take a young Pomgranate before the grains grow in it, and bake it with Allum, casting upon it Vinegar, sharp Wine, and the rust of Iron fryed all together.

of the Falling-fickness.

T cometh to passe sometimes that Sheep are insected with the Falling-lickness, but the cure hereof can never be known, nor yet the sickness well till the beast be dead, and then Tas Hipportage writeth) by opening of the brain it will evidently appear, by the over great moiltness thereof.

of the pains in the Eyes.

T is reported by Theophrasius and Pliny, that for clouds and other pains in the Eye of a Sheed. horned-poppy and Chamelia are very wholfome.

Of Phleame in Sheep.

Or the Remedy of this Disease, take Penyroyal, Marjoram, or wilde Nep made up together Hin wool, and thrust into the Nose of the Sheep, there turned round untill the Beast begin to neeze, also a stalk of black Hellebor boared through the ear of the Sheep, and there tyed fast for the force of four and twenty hours, and then taken out at the same time of the day that it was put in, by Plin and Columella is affirmed to be an excellent remedy against the Phlegm.

of the swelling in the Fams.

Here is sometimes an inflammation or swelling in the Jaws of Sheep, which the Latins call I Tonfile, coming by reason of a great flux of humors from the head unto that place, which may be cured two manner of wayes, first, by incision or opening the skin where the bunch lyeth, whereby all the watery tumors are evacuated, and the Beaft cured; or else if through the coldnesse of the weather or some other accident you list not to cut the skin, then annoint it with liquid Pitch, prepared in such manner as is before expressed for the Scabs, by operation whereof, it will be dissolved and dispersed. When this evill ariseth in the beginning of the Spring, many times it is ared without all remedy, because the Beast for the greediness of the lweet grade stoopeth down ber head, and stretcheth her neck by which the straining and sorenesse of her jawes and throat departeth, and this ficknesse in a sheep is like the Kings-evill in a man. There be some that cure it byputting falt among the meat of these Beasts, or by Juniper berries, and Harts-tongue leaves baten to powder.

For the Cough, and pain in the Lungs.

Ollepherds for these diseases do take the powder of the root of Foal-soot, and mingle it with Osak, so give it unto the Sheep to lick, whereby they are perswaded that the Lungs of the Beast are much comforted and strengthned, and furthermore against the Cough, they take blanched Almonds, and beat them to powder, and so tempering in them two or three cups of Wine, do insuseit in at the Sheeps Nostrils, and likewise Vervine which is called a kinde of Germander. but fallely, because it hath no good smell, is given by shepherds at this day unto their Sheep against the Cough.

Of lighing and shortness of breath.

Or Sheep that are affected with much fighing, they use to hore a hole with an Iron through their ears, and remove the Sheep out of the place where they feed to some other place, and if it come from the fickness of the Lungs, then the herb called Lungwort or Creswort, is the most present remedy in the World: If the root thereof be drunk in water, or a piece thereof tyed under the Sheeps tongue, or (as Cellie faith) give unto it as much Vinegar as the Beaft can endue, or half apoint of a Mans stale urine warmed at the fire, and insused into the Nostril with a little born, this allo is a remedy against Flegm in the Summer time.

Of the loathing of Sheep; and encreasing of their stomach.

I fat any time the Sheep for sake his meat, then take his tail and pull off from it all the Wool; Lasterwards bind it as hard as ever you can, and so he will fall hard to his meat again : and Pliv affirmeth, that the same part of his tail which is beneath the knot will die after such binding, and never have any sense in it again.

of the Fluxes of Sheep, and loofeness of the belly.

Por this disease the Shepherds take no other thing but the herb Tormentilla, or Set-soyl, where withall they stop all manner of laxes, but if they cannot get the same herb, then they take withan they more all manner of hazing increased their thirit, they give unto them black Wine. whereby they are cured.

of the milt of Sheep.

TN April and May, through the aboundance of thick groffe bloud, the Milt of Sheep is flopped and filled, then the Shepherds will take two of their fingers, and thrust them within the Noffrils of the Sheep, there rubbing them untill they make them bleed, and so draw from them as much bloud as they can.

of the sickness of the Spleen.

Prorasmuch as a Horse, a Man and a Sheep, are troubled with the same diseases, they are also be cured with the same remedies, and therefore Spleen-wort given unto Sheep, as to a Min and a Horse (as we have already expressed) is the best remedy for this Malady.

of the Fevers of Sheep.

Sometimes a shaking rage through an incensed and unnatural heat of the bloud in the Sheep begeteth in him a Fever, the best remedy whereof is to let him bloud, according to these Verses;

Quinetiam ima dolor babantum lapsus ad ossa, Cum furit, atq; artus depalcitur arida febris : Profuit incensos aftu avertere : & inter Ima ferire pedis falientem fanguine venam, Quam procul aut molli succedere sepius umbre

Videris, aut summas carpentem ignavius berbas. Extremamq; fequi, aut medio procumbere campo Pafcentem, o fera folam decedere noti. Continuo ferro cuipam compesce : priusquam Dira per incautum ferpat contagio vulgusi ;

In which Verses the Poet defineth the signes of this disease and the cure. The signes he saith are folitariness, and a careless feeding, or biting off the top of his meat, following always the hindmost of the flock, and lying down in the middle of the field, when others be a feeding, also lying alone in the night time, and therefore he wisheth tolet them bloud under the pastern or ankle bone of their foot, but by often experiment it hath been proved, that to let them bloud under theeyes or upon the eares, is as availeable as in the legs; but concerning the Fever we will say more in the discourse of the Lambs.

of the Pestilence or Rottenness of Sheep.

His fickness first of all cometh unto Sheep out of the earth, either by some earthquak, or I else by some other Pestilent humor corrupting the vitall spirit : for Seneca writeth, that after the City Pompeit in Campania was overthrown by an Earthquak in the Winter time, there followed a Pestilence which destroyed six hundred Sheep about that City in short time after, and this he faith did not happen through any natural fear in them, but rather through the corruption of water and air which lyeth in the upper face of the earth, and which by the trembling of the earth isforced out, poyloning first of all the Beatls because their heads are downward and feed 'upon the earth; and this also will poyson men if it were not suppressed and overcome by a multitude of good air which is above the earth. It were endlesse to describe all the evils that come by this disease, how some consume away by crying and mourning, filling both fields and hils with their lamentations, leaving nothing behind them, no not their skins or bowels for the ule of Man: For the cure whereof, First change the place of their feeding, so that if they were infested in the woods or in a cold place, drive them to the hils or to funny warm fields; and fo on the contrary, if in warm places and element air, then drive them to more turbulent and cold pastures: remove and change them often, but yet force them gently, weighing their fick and feeble effate, neither fuffering them to die through lazines and idlenes, nor yet to be oppressed through overmuch labour. When you have brought them to the place where you would have them, there divide them afunder, not permitting above two or three together, for the difeale is not fo powerful in a few as in a multitude and be well affured that this removing of the air and feeding is the best Physick. Some do prescribe three leaved graffe, the hardest roots of Reeds, fand of the Mountain, and such thanks the barbe for the second graffe, the hardest roots of Reeds, fand of the Mountain, Herbs for the remedy of this; but herein I can promise nothing certain, only the Shepherd ought of entimes to give this unto his Sheep when they are found. I will conclude therefore this discourse of the Pestilence with the description of Virgil;

Balatu pecorum, & crebris mugitibus amnes. Arentefq; fonant ripe cellefq; fupini James catervatim dat Bragem ; atq: aggerat ipfis In Stabulio , turpi di lapla cadavera tabo. Done bumo regere, ac foveis abscondere discunt. Nem neg; erat coriis ufut, nec vifcera quifquam Aut undie adolere potest, aut vincere flamma.

Neo tondere quidem morbo, illuvieq; perefe Vellera, nec telas possunt attingere putres. Verum etiam invilos fi que tentarat amillus Ardentes papule, atq; immunduo olentia fudor Membra sequebatur : nec longo deinde moranti Tempore, contactos artus facer ignis edebat.

It is reported by John Stowe, that in the third year of Edward the first, and in Anno 1275. there was a rich man of France, that brought a Sheep out of Spain (that was as great as a Calf of two vear old) into Northumberland, and that the same Sheep felt rotten, or to be infected with the Pellilence, which afterward intected almost all the Sheep of England: and before that time the Pestilence or rottennels was not known in England, but then it took fuch hold, and wrought fuch effects, as in never was clear fince, and that first Pestilence gave good occasion to be remembred, for it continued for twenty and fix years together. And thus much for this difease of the Pestilence caused in Engage land for the most part in moist and wet years.

Of Lice and Tikes.

TFeither Lice or Tikes do molest Sheep, take the root of a Maple tree, beat the same into powder, and feethe it in water, afterwards clip off the wool from the back of the Sheep, and powrethe faid water upon the back, untill it hath compassed the whole body : some use for this purpole the root of Mandragoras, and some the roots of Cypresse, and I finde by good Authors that all of them are equivalent to rid the Sheep from these annoyances: To conclude therefore the discourseof Sheeps diseases, it is good to plant near the Sheep-coats, and pastures of Sheep, the herb Aliffin, or wilde Gallow-graffe, for it is very wholesome for Goats, and Sheep; likewise the flowers of wormwood dryed and besten to powder given unto Sheep with Salt, doth asswage

all inward diseases and pains, and also purge them throughly.

The juice of Centory is very profitable for the inward diseases of Sheep, and likewise the sowers of Ivv. the Hoom tree hath four kinds of fruit; two proper, the Nut, and the Grain two imoroper, the Line, and Hiphear, this Hiphear is very profitable for Sheep, and it is nothing else but a confection made out of the barks of the Hoom tree : the word it felf is an Arcadian word, figuifying no other thing then viscom and fielis. Sheep also delight in the branches of Maiden-hair. and generally the Wool of Sheep burned to powder and given them to drink, is very profitable for all their inward difeases. And thus much shall suffice to have spoken of the several infirmities and skinesses of Sheep, which I desire the English Reader to take in good part, wondering very much sthe manifold wits, and stirring pens of these dayes, wherein I think our times may be compared to the most flourishing times that ever were fince the worlds beginning; yet none have adventured to apply their times and wits for the explication of the feveral licknesses of Sheep and Cattle.

I know there are many Noblemen, Knighte and Gentlemen of the Land, and those also which arevery learned, that are great masters of Sheep and Cattle, and I may fay of them as the Prophet David faith : Their Onen are ftrong to labour, and their Sheep bringeth forth thousands and ten thousands in their fields: Whereby they are greatly inriched, and yet not one of them have had so much commiscration, either cowards the poor Cattle, in whose garments they are warmed, or Charity to the World,

For the better direction to maintain the health of these creatures, as to publish any thing in writing for the benefit of Adams children, but such knowledge must rest in the breasts of filly Shepherds; and for the masters, either they know nothing, or else in strange visitation and mortality of their Cattle, they ascribe that to Witchcraft and the Devill, which is peculiar to the work of nature.

Horfes, Dogs, and almost every creature, have gotten favour in Gentlemens wiss, to have their natures described, but the filly Sheep better every way then they, and more necessary for life, could never attain fuch kindnesse, as once to get one page written or indited for the faregard of their natures. I do therefore by these presents from my foul and spirit, invite all Gentlemen and men of learning, non only to give their mindes to know the defects of this beaft, but also to invent the best remedies that nature can afford, for it is a token of highest mercy unto brute beasts to feed them when they are hunger, and to recover them when they are fick.

Cumida and Varre two great Romens and such as had attained to some of the greatest place of the Common-wealth, being men of excellent with and capacity, yet had their names been forgottenand they never remembred, if they had not written of ruftick and countrey matters, and it is no little honour unto them to have left that behind them in Print, or writing, which themfelves had observed from following the Blough. Therefore it stall be no diffrace for any man of what worth foever to beltow his wite upon the Sheep a for certainly it is no leffe worthy of his wit, then it is of his teach ; and how necessary it is for the incurishment of man; we all know to this day, and befides there is nothing that formsguifyeth our English Nation as the price of our Wool

Of the Sheep.

in all the kingdoms of the World. But what account the antients made of Sheep, I will now in all the kingdoms of the vyorid. But what and Lords were Shepherds, and therefore you tell you; for their greatest men both Kings and Lords were Shepherds, and therefore you which succeed in their places shall bestow much lesse labour in writing of Sheep then they did in which succeed in their places man believe that their antient money, and it is reported of Man-keeping t with the picture of a Sheep they stamped their antient money, and it is reported of Mankeeping t with the picture of a sneep they maintee earth, in token of his blind thankfulness to God, drabulm, that having found a great treasure in the earth, in token of his blind thankfulness to God, drabulm, that naving found a great treature in the Carlot, another of Silver, and a third of Braffe, did dedicate three pictures of Sheep to June, one of Gold, another of Silver, and a third of Braffe, did dedicate three pictures or Sheep to Jano, one of the lawes to be Oxen and Sheep; and no Man and befides the antient Romans made the penalties of the lawes to be Oxen and Sheep; and no Man might name an Ox untill he had named a Sheep.

ight name an Ox untill he nad named a sneep.
Among the Troglodytes they had their Wives common, yet their Tyrants had lawes to keep their Among the Troglodytes they had their wives common, yet their Tyrants had lawes to keep their Among the Trogrammes they had their talgreat penalty for the Adultery of their wife, if the Adul-

terer payed them a Sheep.

rer payed them a sneep.

The Poets have a pretty fiction, that Endymion the Son of Mercury fell in love with the Moon, The Posts have a pietry liction, and that therefore he went and kept Sheep; afterward the Moon fellin love who delpifed him, and that therefore he went and kept Sheep; afterward the Moon fellin love who delpited nim, and that therefore he went and kept disciplination and the moon tellin love with his white Sheep, and defired some of them, promising to grant his request; if he would with his white Sheep, and defired some of them (as Proba writeth) divided his flock into two parts, gratifie her choice: whereupon the wife man (as Proba writeth) divided his flock into two parts, gratine ner choice. Whereupon the which had the courier Wool, and the blackeron the other fide which the white the whiter on the one side white white ones and granted him her love, whereupon Virhad the finer Wool, so the Moon chose the white ones and granted him her love, whereupon Virhad the finer Wool, so the Moon chose the white gil thus writeth;

Pan munere niveo lune captum te Luna fefellit.

It may appear also in what great regard Sheep were in antient time; for that their Priess made holy Water and facrifices for their fanctification, whereof I finde these relations in Gnalmade noisy vyater and later the solution of Sheep there was another manner of landifying dw, Virgil, and others. At the luftration of Sheep there was another manner of landifying then at other times, for the Shepherd rose betimes in the morning, and sprinkled his Sheep all then at other times, for the Suephers round about the fold, with Sulphur, Saville, Lawrell, over with Water, making a perfume round about the fold, with Sulphur, Saville, Lawrell, over with viace, maining holy verses, and making sacrifice to the God Part, for they did believe that by this lustration the health of their Sheep was procured, and all confuming diffales

It is reported that when Sheep of ftrange colours were fprinkled with this water in figurated great happiness to the Princes of the people, and they were gifts for the Emperory differenced by Virgil made these Verses; driven away.

Iffe sed in pratie aries jam sueve rubente and guid accompanies and in the second guidance and guid and second second second sed and second se all thereinward difficient. And the materials of the company

When men went to receive answers of the Oracles, they flept all higher the skine of theep. There was a Noble facrifice among the Pagans called Hecatombe, wherein were facrificed at one with the hundred Sheep at a hundred several Altars.

It is reported of King Tofias, that he facrificed at one time twelve hundred Osen and right and thirty hundred Sheep; fo great was the dignity of this Beaft, that God himself plated in the death thereof one part of his worfhip: and whereas it was lawful among the Heldlers to make their facrifices of Sheep, Goats; Swine, Oxen, Hens, and Geefe; they made refrontly that the Lamband the Kid was best of all, for that God was not pleased with the quantity, the with the quality of the facrifice. The antient Egyptians for the honor of Sheep did neither eat nor fatilite

quality of the lacrifice. The antient Egyptians for the honor of Sheep? did Heither eat how them, and therefore we read in holy Scripture; that the Ifnactive can abouits to the Egyptians, because they both killed, and sacrificed Sheep, as all Divines have declared. If the Egyptians, because they both killed, and sacrificed at the Altar, was easiled away by King There is a noble story of Clittue who when he sacrificed at the Altar, was easiled away by King Alexander, and therefore he lest his sacrifices and went to the King, but three of the sacrifices and went to the King, but three of the sacrifices and went to the King, but three of the sacrifices and went to the King, but three of the sacrifices and went to the King, but three of the sacrifices and sacrifices and very much wonder (and that not without cause) for he called together all the Williams and Sooth-savers to know what that prodict did foreshew whereas they generally adjusted and Sooth-fayers to know what that prodigy did foreshew, whereunto they generally allowed that it did foreshew some fearful events to Clims, for as some as the Sheep which by spontant were dead, that is, ready to die, did follow him that the presence of the king, in the there were avoid a violent death; and so afterwards it came to passe if or allowed with him, because (e.g., is find by bad sailed constant to the product of the king.) pleased with him, because (asit is faid) he had railed on him in his drankenness, after the structure commanded him to be flain, and thus we see how divine things may Be collected from the ratures of Sheep. These things are reported by Plurarch and Pausanias: a arrisen and a collection of the collection of the

Another note of the dignity of Sheep, may be collected from the culton of the limited the When they went to the wars they drove their Goats and their Slicep bufore them, to the month that before they joyned battle they might make facrificet when Gods where them, to the intermediate before they joyned battle they might make facrificet where Gods where were write by the lead the way for the Sheep, for they were drove for holds wind therefore they were write by the shift of the wolves for upon the Holds, and yet could not their ravening nature, they have their ravening nature, they have the Sheep, and delipoyed the Gods will find the first have they to be recorded because the God by God b thy to be recorded, because that God by such an example among the Heather Pagest, and and the frate his love unto the good in sparing the Sheep, and his harred unto the wicked in deal bridge to Goats, and therefore he reserved the Sheep to his own Altania.

When the Greoians sent their spies to the tents of the Trajans, to discover what order, strength, and discipline they observed. Nelor and the ancients of Greece vowed unto the Gods for every one of the Captains a several gift, that was, Oh melatinan, thelps by persons; that is, a black Sheep great with youngs the reason whereof is given by the Scholing they vowed (such is, and a Sheep great with young because of good fortune, for they sped well in Troy. In Apollogia there were certain Sheep that were dedicated to the Sun, and in the day time they fed neer the river in the best pasture, being lodged every night in a goodly spatious cave neer the City, over whom the greatest men both for wealth, strength, and wit were appointed every night to watch by turns for their better safegard, and the reason of this sustody, and the great account made of these Sheep, was for that the Oxide had commanded the Apollonian; to do so unto them, and make much of them. Afterwards Evenim a noble man among them keeping watch according to his turn, fell alless, so that these core of the said Sheep were killed by Wolves; which thing came in question among the Herodous. combon Magistrates to know the reason of that fact, and how it came to pass, whether hy negligators by some other violent incursion: Evenim being sho wayes able to defend it, was condemned to have a third world so that fact on the bounds of the light with this they on a more at a gare or By ablie other violent incurion: Evenim being no wayes able to defend it, was concerning to have both this eyes put out; that to be might be judged never more worthy to fee the light with those yes, which would not wake over their charge, but wink and fleep when they should have broopen. And to conclude, I will but add this one thing more, that whereas the Egyptians worshiped the Sheep for a god, God permitted the same unto the Jews to be eaten among common and put the speep for a god, Sou permitted the same unto the Jews to be eaten among common and valuar meats, and also to be burned at the Altar for sacrifice; and whereas the said Egyptians did not only ear but sacrifice swines flesh. God himself did forbid his people that they should never eat or tast of swines flesh as an abominable thing; by which he signifieth how contrary the precepts of men are to known laws, for that which he forbiddeth; they allow, and that which they allow, he so be dethy and therefore how far the people of God ought to be from superstition, and from the traditions of men, is most manifest by this comparison, for that was never sanctified that came not, into the Temple, and that was never lawful which was not approved by God: and those things which in his law have greatest appearance of cruelty, yet are they more just and equall then the most indifferent inventions of men, which seem to be stuffed out with mercy, and gilded over with

And these things most worthy Readers, I have thought good to express in this place for the digni-ty and honorable account which the greatest men of the world in former times have made of Sheep. and thereby I would incite and flir you up, if it were but one noble spirited karned many which is furnished with wit, means, and opportunity, to dive and pierce into the fecrets of English Sheep, and Shepherds, and to manifest unto the world, the best and most approved means and medines, for the propulfing and driving away of all manner of difeafes from those innocent profitable brafts, and for their confervation in all manner of health and welfare.

I am forry that our times are so far poysoned with Covetousness, that there is no regard of God, man, or beaft, but only for profit and commodity; for as for the fervice of God, we fee that the common devotion of men, and practife of their Keligion, is founded upon a meer hope that therefore God will better prosper them in worldly affairs, and if it were not for the reward in this world, the prosessor of Religion would not be half so many as now they are; and that is true in them which the Devil flanderoufly objected to Job, nartiely, that they do not ferue God for nothing, and they had rather with Diver have the Devils favour in rich garments and delicate fare, then with Lazarus with mifery and contempt, enjoy the favour of God, and to fet up their hopes for an other world. As for Men, we see that the Son loveth his Father but for patrimony, and that one man maketh much of another, for hope to receive benefit and recompence by them; and thereforeitis no marvell if the filly beafts have obtained fo little mercy, as to be loved, not because they are Gods creatures, but for that they are profitable and ferviceable for the necessities of men: for this cause you nourish them, and not like the Apollonians aforesaid for the Oracles sake, but

for their fleeces and their flesh. Therefore if you have any compassion, learn how to help their for their neeces and their nein. Interest is a general benefit, for he cannot be good which is miferies, and publish them to the world for the general benefit, for he cannot be good which is not merciful unto a beast, and that mercy for beafily die which groweth but in one heart of one mor-

There were a company of people in Expicalled Lycopolius, who worthipped a Wolf for a God, and therefore they alone among all the Egyptians did eat Sheep, because the Wolf did eat them; and therefore they stone among an the expression of those men that nourith Sheep for their profit only, then I even to I can make no petter reckoning of those mental than the condition of the Lycopolites, which worshipped a Wolf, for luch men have no other God but their belly, and therefore I trust these reasons shall persuade some one or other to write a larger discourse

first of their

Of their milk.

of our English Sheep.

Of the feveral winds in the next place we are to discourse of the publicles that comesh by Sheep was to the commodity of the next place we are to discourse of the publicles that commodity in the next place we are to discourse of the publicles that commodity is the next place we are to discourse of the self-of the public of the mility coming to man: his flesh, bloud, and milk is profitable for meat, his skin and wool both together and to man: his nein, bloud, and think is profitable for mulick, his hornsand hoofs for perfuming and dri-afunder for garments, his guts and intrails for mulick, his hornsand hoofs for perfuming and dri-ving away of Serpents; and the excrements of his belly and egetion or dung, for the amending ving away of octivenes, and for these occasions did the Egyptiam, worthing it for a God, for that they could fee no creature in the world, but had fome parts alto gether in profitable unto men, but in

this they found none at all.

First of all therefore to begin with their sless, although Physicians have their several conceits therefor, as Galen (who saith) that the sless of Phares is before then the sless of Oxen and Skeep; and Simon Zeibi, who being forced to contain the goodness of Mutton or Sheeps-sless in the beginning and middle of the Spring, yet writeth that it is full of supershiptings and evill juice, and autistic of the spring, yet writeth that it is full of supershipting of Sheeps said an unall slegging and middle of the Spring, yet writeth that it is full of supershipting men in the said over the said over the said through overmuch humidity, and it for none but for Countray showing men: of the said of the opinion of Plating, who writeth thus concerning Rams: Over significant days and the days care may prodoft nerven etiam velocenter abelia, that is The Parabetter and middle days care may prodoft nerven etiam velocenter abelia, that is The Parabetter and middle days care may prodoft nerven etiam velocenter abelia, that is The Parabetter and middle days care may prodoft nerven etiam velocenter abelia, that is The Parabetter and middle days care may prodoft nerven etiam velocenter abelia, that is The Parabetter and middle days are said to the said indeed I grant the opinion of Platina, who writeth thus concerning Rams: Over arisin dealby me aring as, non mode entire dust care not prodest, veryon etiam whementer obsits, that is, That Rams stein we ought never to touch, for it is not only, upprofitable, in the in much hurful, yet in England the stein of Rams is utually eaten, supper through the crast or fubrity of the Burtlers, or este through the crast or fubrity of the Burtlers, or este through the crast or fubrity of the Richert or on the first of Rams, which is done by this means; first there is a kindle of Venison made of the stein of Rams, which is done by this means; first there is the Ram, and beat him with stripes on all parts till the stein grow red, for such is then aute of the bloud. That it will gather to the sick affected places, and there shand to comfort them, so by this means after the Ram is killed, the stein looketh like Venison. But as in other discourse, the means after the Ram is killed, the stein looketh like Venison. But as in other discourse, the means of the stein of the ste namely, Hares and Conies, we have already shewed our harred of all gruel meats, to alfo I utterly distilke this, for it it be not sufficient to kill and eat, the heast, but first of all put is to Tyransical torments, I cannot rell what will suffice, except we will deal with beafts; as PILATE did with CHRIST, who was first of all whipped and crowned with thorns, and yet afterward did crucifle him.

But for the taking away of that Rammy humour and rank moutiness which is found in the Male-sheep, they use to geld them when they are young and suck their dams, or else within the compals of a year after their yeaning, whereby the flesh becometh to temperate, sweet, and layory, as any other flesh in the world; and if they passe a year, then do they use to knit them, and loin time their stones deprived of nourishment from the body by reason of knitting, do dry and confume away, or utterly fall off, whereby the whole flesh of the Beast is made very tasonable and wholesome. It is granted by all that when they are young that is to say, a year old, their sethis very wholefome, and fit for nourifhment of mans nature, but that they increase much phiem, who evill is allaied by eating Vinegar and drinking wine unto it. In many places they falt their Mattons when they are killed, and so eat them out of the pickle, or else roast them in the smooth like Bacon. Within the territory of Helvetia, there is a publick law whereby the Butchers are forbidden to buy any forain Sheep, after the feaft of St. James; that is, the five and twenty day of July, for although that after that time they grow fat, yet is their flesh then less, wholesome, and their fat more hurtfull, then that which is gotten in the Spring of the year.

It were needless for me to set down the division of a dead Sheep into his quarters, shoulden, legs, they have been and applicances for the division of a dead Sheep into his quarters, shoulden, legs, the state of them less than the division of a dead Sheep into his quarters, shoulden, legs, the state of them less than the state of the s

loins, rackes, heads, and purtinances, for that they are commonly known, and the relation of them can minister small learning to the Reader, but every part hath his use, even the bloud that is taken from him when his throat is cut, hath his peculiar use for the nourishment of man, and above all other things the fat of his loins commonly called his fewer wherein it excelleth all other beatts whatfoever, for their reins are covered all over with fat,

There is no less use of their milk not only for young, but for old persons, and as well for the rights beautifie their tables, as for the poor to serve their hungry appetites, and there be some peoples Africk that have no corn in all their Countrey, and therefore in stead of bread, their common fool is milk, the good of the process is milk, the goodness whereof is thus expressed by Fierra;

Quod praftat ? Capra, post ? Oves, inde boves.

Evermore the milk of an Ewe is best that is newest and thickest, and that which comets from a black Sheepis preserred before that which is milked from a white, and generally there is no bak

whereof we ear, but the milk thereof is good and nourifhable, therefore the milk of Sheep is preferred in the fecond place, and there is no caufe that it is put hardle fecond place but for the fatness thereof, otherwife it delenved the firth, for as the fatnele maketh it left plea fant to the palate and tomach of Man, yet is it more pretious for making of Cheefe i and we have thewed already that Tome places of in the Island Bytheas the milk of Sheep yeeldeth ho whay, and that they can make no Cheefe thereof, but by mingling shundance of warer wichit we they make abundance of Cheefe in the Check the stand of the summer summer of the summer into the leafing he method along milk them twice a day, but after, that the they copple with their flams, they milk them hus ones a day, the faults of Cheefes mixter of their milk ly cither because they are over dry, or hollow, and full shopes and his resident of the birdlime the last proceeded from the want of pressing, they second through overmuch sight, and the third by overmuch dry, in the Sun. And thus much shall suffice to have spoken of those third by overmuch is in the sun.

In the next place we comoto discourse of their Wool, and of the shearing or shoep, for although their flesh be pratious, yet it is not comparable in value to their fleeres, for that when they are onge dead, they yeeld no more profit, but while they live they are moth once of their a wear, for in Egyph they are those twice a year, and also in some parts of Spain! And it appeareth that nautient jung affere were great feafts at their Sheep-fhearings; as is apparent in the holy Scripture in many places, and especially by the history of Abidon who after he had offe by needing a gains his Brottler. Amon, his sound no opportunity to execute the same, until his Sheep-shearing feath at which time in the presence of all his brethren the Kings fons (even at dinner) when no man inspected harm, then did Abselon give a fign to his wicked servangs to take away his life, which they reformed according to their Matters malice. performed according to their Masters malice.

It appeareth by the words of Pliny, who writeth thus; Over non ubiq; tondentur, durat quibufdam in locis vellendi mos ; qui ettam nunc vellunt, ante triduo jejunas babent quo languide minus radices lane retinent; thatis, Sheep are not every where thorn, for yet unto this this in many places they do commonly observe the old cultom of pulling the wool of from the Sheeps back, and they which do now pull the wool and not shear it, do alwayes cause the sheep to fast three days before, that so being made weak the roots of the wool may not sink so fast, but come of

more eafly, And indeed I am confirmed in this opinion by the Latine word Velus, which fignifieth a fleece, which can be derived from no other Radix or Theam, nor admit any other manner or kinde of nomion, then a vellendo, that is, from pullinging

Cato alfo in his Book of Originals writeth thus, Palatini collis Rome altera pars Velleia appellata fit, a vellenda, lana ante Hetruscam tonsuram incolis monfiratam; that is to fav. There was one part of the hill Palatine at Rome, which was called Velleia, from the pulling of wool, for it was their custom there to pull their wood, before the inhabitants learned the Helpinton manner of Theating Sheep; by which testimony we see evidently the great torment that the good sheep were pur unto when they loft their fleeces, before the invention of flearing, for it is certain by the antient pictures and statues of Men, that there was no use of shearing either hair or wool, from Men

But the hair of Men grew rude, and in length like Womens, and Streep never loll their fleeces but by pulling off, and therefore Varve writeth, that four hundred and fifty years after the building of Rome there was no Barber or Sheep-shearer in all Italy, and that Public Ticinius Mena was the first that ever brought in that custom among the Romans, for which there was a monument erected in writing in the publick place at Ardea, which untill his time was there fincerely preferved.

Now concerning the times and feafons of the year for the shearing of Sheep, it is not only hard, but also an impossible thing to set down any general rule to hold in all places. The be stthat ever I read is that of Didyrum, nec frigido adimo, nec jam estivo tempore, sed medio vere Oves tondenda Int; That is, Sheep must neither be shorn in extreme cold weather, nor yet in the extreme heat

of Summer, but in the middle of the Spring.

In some hot Countries they shear their Sheep in April, in temperate Countries they shear them in May, but in the cold Countries in June and July, and generally the best time is betwixt the Yernal Equinocium, and the Summers follinger, that is, before the longest day, and after the days and nights be of equall length; there be some that thear their Sheep twice in a year, not for any necessity to disburden the beast of the steece, but for opinion that the often shearing causeth the finer wool to arife, even as the often moving of the graffe maketh it the fweeter. In the hot Columbia. Countries the fame day that they shear their Sheep, they also anoint them over with Oyl the lees of old wine, and the water wherein Hops are fod, and if they be near the Sea fide, three days after they drench them over head and ears in water but if they be not near the Sea fide, then they wast them with rain water fod with Salt : and hereby there cometh a double profit to the Sheep : First, for that it will kill in them all the cause of scabs for that year, so as they shall live safe from that in- Palladius. fection: and secondly the Sheep do thereby grow to bear the longer and the softer wool. Some Celsus. do shear them within doors, and some in the open sun abroad; and then they chase the hotcest

and the calmest days, and these are the things or the necessary observations, which I can learn out of the writings of the antients about the shearing of Sheep.

in England.

Now concerning the manner of our English Nation, and the cultoms observed by us about this bufinelle, although it be needlesse for me to expresse, yet I cannot contain my self from relating phinnens, aithough it de neculeur for me to capitaling. First therefore, the common time the fame, confidering that we differ from other Nations. First therefore, the common time whereat we shear Sheep is in June, and Lambs in July; and first of all we wash our Sheep clean in running sweet waters, afterward letting them dry for a day or two, for by such washing all the in running iweet waters, atterwated letting them tay you way or they to by atter wanning all the wool is made the better and cleaner it then after two days we flear them, taking heed to their fieth, wood is made the percer and cleaned states the fleares, but fit be, then doth the flearer put upon it that it be no manner or way cupped with the meason, but it to be, then doth the meason it liquid pitch, commonly called Tar, whereby it is easily cured and kept lafely from the flie. The quantity of wool upon our Sheep is more then in any other. Country of the world; for even the least try of wool upon our Sheep is more than in any other. Country of the upper most part of Kein; Hinfadhire, among us (such as are in hard grounds) as in Norfolky the upper most part of Kein; Hinfadhire, among us (mere, have better and weightier fleeces then the greatest in other Nations; and for this caule the forgin and Latin Authors do never make mention of any quantity of wool they their from their Sheep, but of the quality.

The quantity in the leaft is a pound, except the Sheep have loft his wool, in the middle fort of the quantity in the least is a pounds, as is vulgar in Buckingbam, Northampton, and Leichfer fibre: But the greatest of all in tome of those places, and also in Ramney marsh in Kent, four or five pounds: and it is the manner of the Shepherds and Sheep-masters to wet their Rams, and so to keep their and it is the manner of the snepherosand sneep-maners to were their ixams, and to keep their wool two or three, years together growing upon their backs, and I have credibly heard of a Sheep in Buckinghamphire in the flock of the L. P. that had shorn from it at one time, one and twenty pound of wool. After the shearing of our Sheep, we do not use either to anoint or wash them, as they do in other Nations, but turn them forth without their sleeces, leaving them like means they do in other Nations, but turn them forth without their sleeces, leaving them like means they do in other Nations, but turn them forth without their sleeces, leaving them like means they do in other Nations, but turn them forth without their sleeces. dowes new mowen, with expectation of another fleece the next year. The whole course of the handling of our Sheep is thus described by the flower of our English Gentlemenhusbands Master

Ibomas Tusser 3

Walh Sheep for the better where mater doth run, And let him go cleanly and dry in the Suns Then frear him and frare not, at two days an end, The fooner the better his corps will amend, Reward not thy Sheep when ye take off his coat With twitches, and flashes as broad as a great :

Let not such ungentleness happen to thine Left flie with ber gentles do make him to pine. Let Lambs go unclipped till June be half worm. The better the fleeces will grow to be floring, The Pre will discharge thee for pulling the rest. The lighter the Sheep is, then feedeth it beft.

And in another place of the husbandry of Sheep he writeth thus:

Good farme and well flored, good boufing and dry, Good corn and good dairy, good market and nigh, Good shepherd, good till-man, good Jack and good Gill, Makes busband and bufwife their coffers to fill: Let pafture be fored and fenced about, And tillage fet forward as needeth without.

Before you do open your purse to begin, With any thing doing for fancy within, No storing of passure with baggagely til, With ragged and aged as evill as it : Let carren and barren be fbifted away, For best is the best, what soever you pay.

And in another place speaking of the time of the year for gelding Rams, and selling of wool which he admonisheth should be after Michaelmas, he writeth thus :

> Now geld with the gelder, the Ram and the Bull, Sew ponds, amend dams, and fell Webster the wool.

But of the milking of Sheep he writeth thas:

Put Lamb fro Ewe, to milk a few, Be not too bold, to milke and fold, Five Ewes allow, to every Com, Sheep wrigling tail, bath made without fail.

And thus far Tuffer, besides whom I finde little discourse about the husbandry of Sheep in any

The value of English wool and the use thereof.

And for the conclusion or rather farther demonstration of this part, concerning the quality of our English wool, I can use no better testimony then that of worthy Mr. Gamden, in his Britamile, for writing of Buchinghamshire he useth these words, Hao tota fere campellris eft, solo item argillace, tenses to facundo, Pabulofis pratis innumeros ovium greges pascit, quarum mollia es tenussima vellera ab diankit est gentibus expetuntur; that is to say, The whole County of Buckingban is of a clammy, champain, fertile soil, seeding innumerable slocks of Sheep with his rich and well-growen pastures of medoures whose General County of Sheep with his rich and well-growen pastures of medoures whose General County of Sheep with his rich and well-growen pastures of medoures whose General County of Sheep with his rich and well-growen pastures of the sheet of th medowes, whose fost and fine fleeces of wool are defired of the people of affa; For we know that such is the trade of the state of the that such is the trade of Merchandise and transportation of English cloth, the rare fineast and smoothnesse thereof is admired in Asia; namely, in Palestine, and other Kingdoms of the

Turk, and therefore they have English houses of Merchants, both at Aleppo, unpoli, and other places. Again speaking of histories, or Lemster wool in Hersondhire, heinveiteth thus: Sed ei places. Again prenting that the street would respect to the street alius: Sed ei presipiahoft glyin est a lang in circum picinia agri (Lemiter ore vocant) est in their wool, which arriest falment diffint Englest, opposition to the seding in the fields and galtures adjoyning thereunto. (which wool they call Lemiter ore) and all Christendom yeeldeth praise and price unto it next after the Apultan and Taxentinian

Of the Sheep.

And indeed to fweet is the gain that cometh by Sheep, that in many parts of the Land there is a decay of tillage and people, for their maintenance, and therefore the faid Mr. Camden faith most worthily, even like himself, that is honest and unpartial in all his writings, for in the beginning of worthing the man in the state of the state o Towns is most plentitul, (to that for Christians now you have theep, and for a mulitude of good house-holders, you hall have, one. Shepheard swain and his Dog lying upon forty shillings a year, or little more) he written in the words of Histodam after the commendation of the Sheep and woo of that Countrey. Onlying spicia & quali possess, que the Histodam (the dines) tam mer fill sample exists all solebant, nume suffers the exaces as que indomine essential better the homines desponsent, plot agree, down in possess and suffers the desponsent which worlds L cannot better English then, in the words of an Epigrammaterian in our age, for to this effect according no my) remembrance he writeth; his time char fold a Reactifica. Commercial contact in a contact

Sheep have eat up our paftures, our medowes, and our downes, Our Mountaint; our Ment our Villages and Towns; 114 now I thought the solution provest did buijeft, That says a biting beaft.

Concerning the goodness of English Wool, and the difference of it from others, the reason is well given by Gesper and Gardan: Lana easum molles & crispa sunt, ideag, mune ut olim Milesia celebratur nec mirum cum nullum animal venenatum mittat Anglia . Si sina, luporum; metu. prom. uageim militat Anglia . Si sina, luporum; metu. prom. uageim militat anglia si in militat de lupi reperiminur. Rore cali sitim sedant greges, ab ommi alio notu arcentur quod aqua ibi oribus sini existales; that is to say. The wool of English Sheep is soft and curled, and therefore it is now commended as highly as ever was the Milesian wool in ancient time : and not without just cause, for they are neither annoid with the fear of any venemous Beattinor wet troubled with Wolves and therefore the ftrength of their nature and peaceable quiet wherein they live, doth breed in them thebetter wool; and besides they never drink, but quench their thirst with the dew of heaven. And thus much for the discourse of English wool.

I am never able sufficiently to describe the infinite commodities that come junto men by wool, The wool of both for gardens, for hangings, for coverings, for hats, and divers fuch other things, and there- other Counfore it shall not be umpleafant I truft unto the Reader, to be troubled a little with a farther di- tries. sourse hereof, if I blot some paper in describing the quality of the best wood in other Nations. Fift of all therefore we are to remember these two things, that the best wool is fost and surled, and

that the wool of the old Sheep is thicker and thinner then the wool of the younger, and the wool of the Ram followeth the same nature, of whom we will speak more in his story Only in this place our purpole is to expresse the examination of wool as we finde it related by Authors, according to their several Countries. Therefore as we have said already, out of Mr. Camdens report, the Tarentinien and Apulian must liave the first place, because the Sheep of those Countries live for the moth part within doors, and besides that; are covered with other skins. In Spainthey make greatest account of the black wool, and it appeareth by good History, both in our English Chronice and others, that the Sheep of Spain were of no reckoning till they were stored with the breed of England. There is a little Countrey called Pollenia neer the Alpes, of the wool whereof Martial maketh menti-

on, as also of the Canufine red, wool, and therefore Ovis Canufina was an Emblem for pretious wool, his Verses are these:

> Non tantum pullo lugentes vellere lanas. Roma magis fuscis, vestitur Gallia ruffis, Canufinajus noffro Syrus affere fudet.

We have spoken already of the wool of Istria and Liburnia, which if it were not for the spinning in Patugal, and the Websters art thereupon, it were no better for cloth then hair. Strabo writeth, that the wool of Mutina, whereby he meaneth all the Countrey that lyeth upon the Schiena, is very fost and gentle, and the best of Italy, but that of Ligaria and Millain, is good for no other use but for the garmen's of fervants.

About Padua their wool is of a mean price, yet they make of it most pretions works of Tapestry; and Carpets for tables, for that which was rough and thick in antient time was nied for this purpose and also to make garments, having the things thereof hanging by it like tage. Where is a City called Felinum, and the wool thereof by the Merchantes called Felinum, and the wool thereof by the Merchantes called Felinum, and the wool thereof by the Merchantes called Felinum, are the fire like, hard grately to make garments hereof neither woven nor fewed, but baked together at the fire like hats and caps, whereof Pliny writeth thing, Lana & per se coalla vestem fagiunt, & fi addatur geetum ettam ferro

og gordseski amakari.

The History of Four-footed Beasts.

resistant, imo vero etiam tynibus novissimo sui purgamento quippe abenis coquetatum extratie indumente un veniant Gallorum un arbitroi invento, certe Gullicu hodie nominibus discermentar. Wood hich chis property, that if it be forced together it will make a garment of it self, and if Vinegar be but unto in it will bear of the blow of a sword dressed at the fire and purged to the last, for it being title offrom the brazen toffer whereon it was dressed, it served for clothing, being as he knought an invention of the Galle because it was known by French names, and from there we must be the begin ming of our felt-hats. The Betican wool is celebrated by Juvenal, when he speaketh how County fearing thipwrack, was about to caft him out into the water ; Lant all his borne lile to be Fredrick trip out usvo

in go the second of the second

Of the colours For the colour of Wool in that Countrey groweth mixed, not by any art, but naturally through of Wool. Their food, or their drink, or the operation of the air. The Lavolutian Wool is also celebrated, not only for the softnesse of it, but for the volum, for that it is as black as any Rayen, and yet there are somethere of other colours, and for this cause that Spanish Wool is commended, especially Tudits. is me there of other two written) for he faith the gloffe of the Wool was not only beautiful for the mu und comer cas offace written in out into fo thin a thread as was admirable; and therefore in purity of the blacks but also it will frin out into fo thin a thread as was admirable; and therefore in his time they fold a Ram of that Countrey for a talent. I may speak also of the Wooll of Paine, and Altinum, whereof Martial made this distiction;

Velleribus primis Appulia ; Purma Jecundis Nobilit, Alvinum tertid landat ova.

We may also read how for the ornament of wool, there have been divers colours invented by art, and the colours have given admented to the Wool, as Situatilis lana, wool of Sta-water-colour, some colour taken from an amanufit stone; some from brightness or cleaness, some from Saffron, forac from Roles, from Miteles, from Nuts, from Almonds, from Wax, from the Crow, as Color corantom, and from the purple fifth, as from the Colonian, or the Tytian, whereof Vinil writeth thus; . This is a solid grown and a group the

His quoqu non oura nobie leifere inenda, Lac. He quoq non our a nobis levifore tuende, Vellera mutentur Tyelor intolle rubores.

From hence cometh the chalke colour, the Lettice colour, the Loot-tree root, thered colour, the Prom hence comern the charke colour, the Lettice colour, the Loot-tree root, there colour, the Azurecolour; and the Star colour. There is an herb called Fullers-herb, which don foften Wool, and make it and to take colour, and whereas generally there are but two colours, black and white that are simple, the antients not knowing how to die Wool, did paint it on the outlides for the training garments with Homer were painted garments. The Physian garments were tolours wrought with needle-work, and there was one antiena King in Aira, which did first of all the work and there was one antiena King in Aira, which did first of all the works are the was size of the star of the st invent the weating of Wool and Gold together, whereupon came the name of Velia Analica, for a garment of cloth of gold.

The Babylonians and the Alexandrians loved divertity of colours in their garments allo; and therefore Metelles Scipie made a law of death against all such as should buy a Bebylenish garment, that was carpets by beds to eat upon for eight hundred Sesserces. The shearing of cloth or garments made of thorne cloth, did first of all begin in the dayes of St. Augustine, as Feuitella writes. The garments like poppies had the original before the time of Lucilius the Poet, as he maketh men-

tion in Tarqualia:

The lasting of There was a fashion in antient time among the Romans, that a distasse with Wood upon it, was carryed after Virgins when they were going to be marryed: the reason thereof was this (as Varie writeth) for that there was one Tanaquilia, or, Gaia Cecilia, whose Distaffe and Wool had endured in the Temple of Sangi many hundered years, and that Servinis Tullus made him a cloke of that Wool, which he never used but in the temple of Fortune, and that that garment afterwards continued 500 and 60 years, being neither confumed by moths, nor yet growing threadbare, to the great admiration of all which either faw it or heardit. And thus much I thought good to adde in this place concerning the diversity of Wool, diffinguished naturally according to level regions, or elfe artificially after fundry tinctures. Lifewife of the mixing and mingling of wooland Garmens, and diverficies of garments, and talkly of the latting and enduring of Wooland Garmens, and talkly of the latting and enduring of Wooland Garmens, and talkly of the latting and enduring of wooland garmens. for it ought to be no wonder anto a reasonable man, that a woollen garmene not eaten by moits, nor worn out he use should less man, that a woollen garmene not eaten by moits, nor worn out by use, should last many hundred years, for seeing it is not of any cold or earthly neture, but hot and dry, there is good cause why it should remain long without putrisation; and thus much in stead of many things for the Wool of Sheep.

As we have heard of the many things for the Wool of Sheep.

The use of

As we have heard of the manifold use of the Wool of Sheep, to may we fay very much of the Skins of Sheep for garments and other uses: and therefore when the Wool is detracted and put of four than the wool is detracted and put of four than the wool is detracted. led off from them, they are applyed to Buskins, Brent-places, Shooes, Gloves, Stomachers, and other uses, forthey are also dyed and changed by tincture into other colours, and also when the Wool

Wool is taken off from them, they dreffe them very smooth and stretch them very thin, whereof is made writing parchment, then as is commonly used see this day in Engand, and I have known it practifed at Tocetour, called once Tripontium in the Courty of Northampton: and if any nart of it will not thretch but romain flife and thick "thereof they make writing tables, whereon they write with a pencil of Iron or Braffe and afterward deface and rafe it out again with a founge or linnen cloth. Hereof also (I mean the skins of Sheep) cometh the coverings of Books. and lavary time they be hard, Rubborn; and Miffe, then the forten it with the Sheeds lewet

With the dung of Sheep they company and the tarth it being excellent and above all other of the dung of dung needflary for the senant and encrease of Corn, extent proposed and Hera dung which is there ter, and the sandy lands sheefs to be amended with Sheeps dung, also plants and trees if you mingle therewith afties. 331

mingle therewith aires.

Now we are to proceed to the gentle disposition of Sheep, and to express their initiary qualities the inward and moral ules; and first of all considering the innocency of this Bealt? This word qualities of General Contant Contan custom proceeded; which calded Additing the publishment to ride through Sheep and out the whole City crowned with Wool, except that to they might applied his tender and their moral esteministy; and therefore as some are crowned with gold in token of with Gold in the contant with contant acts, so Hermolans, vice (especially the wantonnels of the flesh) defer the to be crowned with Wool, the southers and the standard contant acts. and beatkline is thereof, not because such's crown was a fufficient punishment, for an opprobry and

tontinual badge of ignominy? even ar forgeters and perjoind perfors hill with papers on their hads, upon bare horse backs, and so forth. By the behaviour of Sheep at their Rusting of Ramming time the Shepheras obletve tempers, rins, and thange of weather. If they be very luftful and leap often upon their females, but if they bellow and backward, then is the poor makely man glad, for that thereby he conceiveth hope of s gentle Winter, and temperate weather. Alfoif in the end of Autumn they flamp upon the ground with their feet, it betokeneth hard weather, bild Winter, much Froit and Snow, about the time of the first rising of the Pleistes of feven Stars. Which thing is thus Poetically expressed by Avienus; Section of the control of the contro

Si dening terram Lunigere fodiant caput, aut tendantur in artion, Cam madidus per marmoru turbida conditi Pletadas occajus, cum brume in frigoracedit Frugifer Autumnus, ruet atbera concitta imber.

Concerning the simplicity of Sheep, I must say more, and also of their innocency, yet the simplicity thereof is luch and so much, that it may well be termed folly, or Animal ineptissum, for Arisote writeth thus of it. Repit in deferta fine chusa bythme obstante issum sepredium stabulo, occupations a nive, nispassor compulerit, abire non outs, sed perit desirens, nist mores a passor computer, it a enim, reliquar grex sequint; that is, Withous cause it wandereth into desert places, and in the winter-time when the air is filled with cold winds, and the earth hardened with houre froftes, then it forfaketh and goeth out of his warm coat or stable, and being in the cold Snow, thereit will tarry and perish, were it not lor the care of the Shepherd, for he taketh one of the Rams by the horns, and draweth him in adoors, then do all the residue follow after. They are also very obedient to the voice and call of the Shepherds, and to the barking and cry of their Dogs, and no leffe is their love one toward another, every way commendable, for one of them, picyeth and for toweth for the harm of another, and when the heat of Sun offendeth them, albert we writeth, that one of them interpoleth his body to shadow the other.

Their Danror Ewe loveth her Lamb, and knoweth it by finelling to the hinder parcs, and if at any time the Dam do not love or make reckoning of her young one, they give her the herb Pennywort or Water-wall to drink in water, and then as the Schollaft affirmeth, natural affection increafeth in her. Of the foolishness of Sheep, there was an Emblem to signific by a man riding upon a golden Pleece, one ruled by his fervant or wife;

The gen writing upon Levilieus, faith; Ovium immolatio affedium fluttorum, or irrationabilium corredit. The gen writing upon Liviness, latti; Josephing elfe but the correction of our foolish and unreasonable Sacrincing and simile the surely, is nothing the doct the Goat, of a Goat, that notified a Wolfs affections. We have the wed already in the flory of the Goat, of a Goat, that notified a Wolfs whelps, which in the and did defroy her, and the felf time is affectived alforto a Sheep, e.g. viii.

Love and hatred of Sheep. Ariftotle.

Calim.

whelps, which in the spand dentroy her, and the sad and live in flocks together, and forbis cause. They observe great love and contord with Goats and live in flocks together, and forbis cause it happeneth, that the Goats for ske it happeneth, that the Goats for ske it happenern, that must be be been the sheep very feldom s. and it is observed, that their fellows, and traggle abroad for food, but the Sheep very feldom s. and it is observed, that their retions, and stranger and afterwards any garments be made of the wooll of that Sheep, they eait a work and a success and allo produce itch in the bodies of filly and more speedily breed Lice and yermin then any other, and also produce itch in the bodies of them that wear them, whereof Cardan Biveth this reason; Hand miran; where debe on pellon, a Lupo them that wear them, whereof Caraan Biver thin, Jungliam ob contraviam and the many count a lugo dilaniata pravilum maiste, mam ob vehement on methods, for the countraviam and the many countraviam and the countraviam maister of the countraviam maintaviam maister of the countraviam maister o more enim ultimum fit supplicium, magu tamen assiciur corpus in uno quam sei munto wonder, that the wooll in mari sustinant quam coram possibus. It ought not (saith he) move any man to wonder, that the wooll of a Sheep torn asunder by a Wolf, should beget and breed itch for that affection arises from both from the vehemency of fear before it be dead through the sight and sense of the Wolf, and also by from the venemency of tear before it by the devouged by another, and although death be the rea(on of a contrary nature that is opposited and devouged by another, and although death be the last punishment, yet we see divers affections follow dead carkales after death, and as a man is more afraid of the Sea when he is in peril of death therein, then of the face of his enemy, fo is it in this cafe,

betwixt the Sheep and the Wolf.

The fame Cardan affirmeth, that Sheep are afraid of Wolfs even after death; for the wooll of a Sheeps skin will fall off in the presence of a Wolf, Unto this subscribeth Opplanus, or rather Albertus received it from Opplanus, and furthermore (it is said) that if the strings of a Sheeps and Wolfs guts be fastened to one and the same Instrument, they will never make good Harmony; and further more, if a Drum be made of a Sheeps skin, and another of the Wolfs skin; the Drum of the Sheeps skin will jar, and found unpleasantly in the presence of the Wolfs skin; but of the schings I have no certain grounds, only I say, there may be natural reason from the substance and matter, both of one and other, why this accident may chance without discord and hatted of each other, but from the difference and folidity of the matter, as for example; the guts of a Wolf are frong and hard, and will abide greater frain then the gure of a Sheep; if therefore the Multim will frain the one like the other, it must need fly afunder: likewife the skin will give a deeper and lowder found upon a Drum, by reason of the substance, then a Sheeps: and so some may goorantly afcribe that difference to an antipathy in nature, for as a Candle in the presence of a great Torch or Fire, giveth left light to the eye, to doth a drum made of a Sheeps ekin; lefs found to the fente of hearing in the presence of another made of a ftronger and harder beafts skin: and to conclude, as a twine thread will not hold firetching in the presence (I mean in comparison) of a silk thread, although it be of the same quantity, even so will not a Lute string made of a Sheeps gut, in comparison of another made out of a Wolf. But all the question is, how it; comet to pass, that one of the skins hanged up in the presence of the other should be consumed before other, that is, a Sheeps skin in the presence of the Wolfs, as a Gooses skin will loofe the feathers before the Hagles. The anfwer is easie, for the dryer that the body is, the less excremental humor it containeth: and so will laft the longer, and all wilde filvestrial beasts are dryer then the tame, modern, and domestical, as for example, the Wolf then the Sheep; the Lion then the Dog; the Pheafant then the Cock; the Eagle then the Goofe: and for these causes the skins of the one do waste before the other, not for fear or fecret opposition, but for want of better enduring substance.

The Poets do ascribe unto their Gods Laness pedes, feet made of Wooll, for that they come sortly

and fuddenly without noise to take vengeance upon malefactors; and therefore when they describe Saturn tyed up a whole year with bands of wooll, their meaning is, to thew how with patience he forbare his wrath and indignation. Bees are enemies to Sheep; and there are no cattel that do fo

much inrich men as Sheep and Bees.

There is a story in Suidas and Hefschius, of one Chrysamis, who was very rich in Sheepinthe Island of Cons, and there came every year an Eel, and stole away his best Sheep among all the socks, at last he met with it and flew it; afterward the ghost of the Eel appeared to him, in the night, warning him (for fear of other harm) to fee him buryed. Chryfamis neglected it, and therefore heandall his family perished. By which story I cannot guess any other meaning, but that some man sole away his Sheep, and for that he took upon him a private revenge, most inhumanely suffering him to lie unburyed, and fetting more by a beast then the life of a man, as a just punishment of God he posithed : and thus I conclude this natural and moral discourse of the Sheep with that siction of E/op, who writeth that on a time as the Shepheards were making merry in a Cottage, and eating a Sheep, the Wolfcame and looked in, faying unto them : Atqui ego fi tantum facerem, quantum cieretis tumulium ? If I flould est Sheep as you do, you would all rife in an uprore: which is fitted against them that make good laws, and observe none themselves.

Of the RAM. James ! 1,50

Aving thus made a general description of the Sheep, wherein we have spent no more time The several then was fit and convenient, we are now forced to the several species and kindes, and first names of of all, order and nature teacheth us to discourse of the male, which in our English language is called Rams. a Tup or Ram, derived I do not doubt from the French, Ran, although also they call him Belier; the Germans, Hoden wider, and Hammell; the Italians, Montone, and Ariete; the Spaniards, Carnere; the Helorian, Ramchen; the Grecians in ancient time Krios, Ariacha, Cerafte, and now in these days Kriore; the Heloren, Ail, or Eel; the Chaldeer plurally, Dikerin; the Arabian, Rabsa; and the Persians, Neramisch. Now concerning the Greek and Latine names, there is some difference among the learned shows the about their notation, etymology, or derivation; for although they all agree, that Aries of dun & marilus peurum, yet they cannot consent from what root, stem, or fountain, to setch the same. Isidenu bringeth Aries ab aris, that is, from the Altars, because the sacrificing of this beast was among all other Sheep permitted, and none but this except the Lambs. Others derive it of Aretes, which fig.

nifieth vertue, because that the strength and vigor of Sheep lyeth in this above all other, for there nineth vertue, because that the transfer in his minde or inwards part incredible courage and magnanimity, is in his horns incredible frength, in his minde or inwards part incredible courage and magnanimity. but the truest derivation is from the Greek word Marting Some Latines call him also Nefrens, and but the truelt derivation is from the Greek word active or gelded Sheep, for the stones were also cal-plurally Neftendes, for distinction from the Weather or gelded Sheep, for the stones were also cal-led Neftendes and Nebrandines, and the Epithets of this Beast are, horn-bearer, insolent, violent, led Nefrendes and Nebrundines, and the Epitnets of this Beat are, non-pearer, intolent, violent, fighting, fearful, writhen, swift, wooll-bearer, leaping, head-long, warriour, and in Greek, meek, gentle, and familiar, and is not known by the name Chilos, for that it leadeth the whole flock to the gentle, and familiar, and is not known by the name Chilos, for that it leadeth the whole flock to the pastures, and back again to the folds. And thus much may suffice for the name and demonstrative pattures, and back again to the folias, and thus the cheer parts of his ftory, not reitera. appellation or this Dean; how we will proceed the Sheep already described, but only touching his ting those things which it hath in common with the Sheep already described, but only touching his special and inseparable proper qualities.

The chief of Rams for breed.

recial and interparative proper quantity fit to be the father of the flock, and to generate and in-First of all for the election of Agus at call him Admissarius Aries, a stallion Ram. They were crease issue, and therefore Vario and others, call him Admissarius Aries, a stallion Ram. They were wont to make choise of such an one from an Bwe that had brought forth twins, for that it is conwont to make choice of factions of for first in the choise of a Ram, they look unto his breed and ceived, he will also multiply twins; for first in the choise of a Ram, they look unto his breed and flock from whence he is descended, and then to his form and outward parts: as in Horses, Oxen, Dogs, tock from whence he is descended, all creatures, there are races and stocks preferred one before another, so is it also in Sheep, and therefore require that he be Boil Jeminia peeus, a Ram of a good breed, and next allo in Sneep, and therefore require that he were look further then solour; but Columbia advifeth of the form and outward parts, although fome never look further then solour; but Columbia advifeth or the form and outward parts, and tongue be all of one colour, for if the mouth and tongue that his wooll, palate of his mouth, and tongue be all of one colour, for if the mouth and tongue be spotted, such also will be the issue and Lambs he begetteth, for we have shewed you already that the Lamb for the most part followeth the colour of the Rams mouth, such a Ram is the described by the Poet.

Palladius.

Illum autem quamuis arles fit candidus ipfe. Nigra subest ude tantum cut lingua palato, Rejice, ne maculis infuscet vellera pullis Nascentum.

Crescentius.

Golumella.

And therefore for as much as the young ones do commonly resemble the father, and bear some notes of his colour, let your Ram be all black, or all white, and in no tafe party-coloured; and for the stature and habit of his body let it be tall and straight; a large belly, hanging down and well cloathed with wooll; a tail very long and rough; a broad fore-head; large stones; crooked winding horns toward his fnowt, having his ears covered with wooll, a large breaft, broad fhoulders and buttocks; his fleece pressed close to his body, and the wooll not thin nor standing up. And for the horns, although in all Regions Rams have not horns, yet for windy and cold Countries the great horned Beafts are to be preferred, for that they are better able through that defence to bear of winde and weather, yet if the climate be temperate and warm, it is better to have a Ram without horns, because the horned Beast being not ignorant what weapons he beareth on his head, is apter to fight then the pold Sheep, and also more luxurious among the Ewes, for he will not endure arival or companion-husband, although his own frength and nature cannot cover them all : but the pold Ram on the other fide is not ignorant how naked and bare and unarmed is his head, and therefore like a true coward, fleepeth in a whole skin, being nothing fo harmful to his corrivals, nor to the female, but well indureth partnership in the work of generation.

Albertus. The refemblance betwix the Sun and the Ram.

Macrobius.

There is no Beaft in the world that fomuch participateth with the nature of the Sun as the Ram, for from the Autumnal Rquinodium unto the Vernal, as the Sun keepeth the right hard of the He misphere, so doth the Ram lie upon his right side; and in the Summer season as the Sun keepeth the other hand of the Hemisphere, so doth the Ram lie upon his other fide. And for this cause the Lybians which worshipped Ammon, that is the Sun, did picture him with a great pair of Rams horns. Also, although in the heavenly or celestial sphere or Zodiack there he nothing first or last, yet the Egypians have placed the Ram in the first place. For their Astronomers affirm, that they have found out by diligent calculation, that the same day which was the beginning of the world light on the face of the Farth them was the first place. of the Earth, then was the fign Aries in the midft of Heaven, and became the midft of Heavenias it were the crown or upper-most part of the World, therefore the Ram hath the first and uppermost place, because it is an Equino dial sign, making the days and nights of equal length, for twice in the the Ram in the year doth the Sun pass through that fign, the Ram sitting as it were judge and arbiter twice every year, betwixt the day and night. There be Poetical fictions how the Ram came into the Zodiack; for some say, that when Bacchw

Cælius. Zodiack.

led his Army through the Deserts of Lybia, wherein they were all ready to perish for water, there appeared to him a goodly Ram, who shewed him a most beautiful and plentiful fountain which re-Poetical ficti- lieved and preserved them all, afterward Bacobus in remembrance of that good turn erected a Temple ons & riddles. to Jupiter Ammonius, also in that place for so quenching their thirst; placed there his Image with Rams horns, and translated that Raminto the Zodiack among the Stars, that when the Sunfhood pass through that fign, all the creatures of the world should be freshigreen and lively, for the same cause that he had delivered him and his Hoast from perishing by thirst, and made him the Captainst all the residue of the signes, for that he was an able and wife Leader of Souldiers. Other against the tale fomewhat different, for they fay; At what time Bacchui ruled Egypt, there came to him one

Amount, a great rich man in a frive, giving to Brookin great thous of wealth and cattel to procure favour units him; and shar he might be reskoped an inventer of form things; for requital whereof favour units him; he land of there in Egypt, to keep his sheep and cattel, and afterward for that invention he was pictured with Rame horse on his head. for same interest the brought the first invention he was pictured with Rame horse on his head. for same in Heaven: These and such like first on here are about all the lignes of Heaven, but the trues observation and reason we have showed before 90% of the Fasting leating, and sherefore I will cease from any farther prosecution of these falls. They ought to be two was cold at least before you suffer them to joya in consulation with the Didymus. They ought to be two was cold at least before you suffer them to joya in consulation with the Didymus. Bues, and for two may more sagestly and perfectly fill the Ewes: and then also before copulation, and at the time that they are permitted in some Countries they give them Barly, and mix Onions with their mean, and specific them with the pleast salomous seals for all these are vertuous to the un

ons with their mear, and freed them with the head Salomons fealifor all these are vertuous to fir up and incease their nature. And like wife one kinde of the Saryrim and falt water, as we have said in the

fifcourse storegoing. A distance of experimental state of the store of This Beath may continue in copylation, and be preferved for the generation of Lambs till he be eight year old; and it is their namy a the alder they be, to feek out for their fellows the elder Bwes or females, forfaking the younger by a kinde of natural wildom.

Now concerning the time of their admission to copulation, although we have touched it in the The best time former Treatile, yet we must add fomewhat more in this place. In some places they suffer them in of capulation, Anil, and fome in June, that for they may be palt danger before Winter, and he brought forth in the Autumn, when the grafa after harvest is tweet, but the best is in Ollober, for then the Winter will be over-passed before the Lamb come forth of his dams belly an Great is the rage of these Beasts at be over-paired negore the Lamb come touch of this dams bully indigract is the rage of their Bealts at their copulation, for they fight irefully till one of them have the ristory, and for this cause Ariejare among the Writers is a word-to express lingular violence;

Arietat in portat & discrebility popular violence;

And Silvie of Discription is to the control of the control of

And to Senece in his book of Anger, Magno imperatori antequam actes inter fe assistance, or exclusi: Their rage in And indeed great is the violence of Rames for it is reported that many times in Rhetis to try their Ramming violence, they hold betwiet the fighting of Rames a flick, or bat of Corn-tree! which in a bout or time, two they utterly diminish and bruile in piecess. I have a first a couple of Rames, and told them that may have one of them which may be not one of them.

that he must have one of them to his dinnet, and bad them agree betwirt themselves, to whose lot that death should happen, for one of them must die; the two Rams agreed together, that the Wolf thould fland in the middle of the close, and that they twain should part one into one corner, and the other into the other corner of the field; and fo comerunning to the Wolf, fend he that came last should lose his life to the Wolfs mercy; the Wolf agreed to this their device, and chose his standing, while the Rams consented with their horns, when they came upon him to make him sure enough from hurting any more Sheep: forth therefore went the Rams, each of them unto his quarter, one into the Baft, and the other into the West, the Wolf standing joyfully in the midst, laughing at the Rams, destruction; then began the two Rams to set forward with all their violence, one of them fo attending and observing the other is as that they might both meet together upon the Woolf, and so they did with vengeance to their enemy; for having him betwize their horns they crushed his ribs in pieces, and he fell down without stomach to Rams sloth. This invention, al- Martial and though it have another moral, yet it is material to be inferted into this place to thew the violence warlike invenof Rams; and from this came fo many warlike inventions called Arietes, whorewithal they push Rams down the walls of Cities, as the Readers may see in Vituvius, Valuante, and Americans, for they say that the warlish Ram was made of wood, and covered over with thele of Tortogles, to the intentit hould not be burned when it was fet to a wall, and it was also covered with the skins of fack-cloth by rows artificially contrived, within the same was a beam which was pointed with a crooked Iron, and therefore called a Ram, for rather because the front was so hard that it overthrew walls, when by the violent strength of men'te was forced upon them; and whereas it was shaped over with Tortoile fhels, it was for the true resemblance it bare therewith; for like as a Tortolfe doth sometime put forth his head, and again formetime pull'it in, fo alfo doth the Ram fometime put forth the ficle, and fometime pull it in, and hide it within the frame, fo that by this engine they did not over-turn the walls, but also they cansed the stones to die mon the enemies like thunder-bolts, striking them down on every side, and wounding with their fall or stroke like the blows of an armed man; and sgainft thele forces there were counter-forces deviled on the part of the belieged, for because the greatness thereof was such as it could not be moved without fingular note and oftentation; it gave the belieged time to oppole against it their instruments of war for their safeguard, such were called

Culcitre, Laqueis Lupi ferrum, madetike a pair of ronges whereby as foreins writeth? hiant time is cartle to pale; that when the wall way overthrown the enemies durit not entering this combines point ab oblight describe manie mentice impeded in iribem non andebath. Cardan.

It is reported by Rafis & Albertus, that if the horns of a Ram be buryed in the earth, they will turn in to the herb Spirage; for rottenness and putrefaction is the mother of many treatures and herbs. There was, as Aristotle reporteth in his Wonders, a childe born with a Rams head : and it is affirmed by Ovid, that Medea inclosed an old decepit Ram in a brazen vessel, with vertain kinde of medicines, and afterwards at the opening of the said vessel, she received a young Lamb, bredupon the Mannorphosis of his body)

Concerning Phrizus, whereof we have spoken in the former part of our discoulte of the Sheep, there is this story. He was the son of Atheman, and Nopheler: Afterward his mother beligded, he

The ftory of Thy yxus and

the Ram with

a golden Apollonius.

feared the treachery of his mother in law, and frep-dame Inus, and therefore with his fifter Hele, by the confent of their Father, he fwam over a narrow arm of the Sea upon the back of a Rain ? arrying a golden fleece, which before that time his Father had beftowed upon him. His filter Hill being retrified with the great roating of the water, fell off from the Rams back into the Sex, shift thereof came the name of Uselfort, of Helle the Virgin, and Pontus, the Sex, but he came lately to call to King Meus, where, by the voyce of a Ram, who spake like a man, be was continued to offer the came and the sex of the and dedicate him to Jupter, furnamed Phrywus, and also that golden fleete was hanged up and retried in the Temple of Colobs, until Jason by the help of Medea aforesaid did fetch it away, and the Ran was placed among the Stars in his true mape, and was called Portion, of Phrinus, who was the Pather Lothe West C West to Of this fabulous tale; there are many explications and conjectural tales among the learned, not

unprofitable to be rehearfed in this place. Callus and Palaphatis fay; char the Ram was a thin whole badge was a Ram, provided by Athaman for his fon to fall into Physia: and fomelay, this arter was the name of a man that was his fofter-father, by who fercounfel and charge he was delivered from his

are in informal to be all a saline . The contract of the Other fay, that there was a Book of parchment made of a Rams skin; containing the perfect way to make gold, called Alchimy, and thereby Phinas gor away Bur in Albens there was releved the Image of this Phriams, offering the Ram (upon which he was born over the Sea.) to the God Lability us : and whereas there are in Colobie certain Rivers out of which there is gold growing and offer times found, whereupon some of them have received their name, as Chrysorthod, and themen of that Countrey faid to be greatly inriched thereby, they gave occasion of all the Poetical Actions about the golden sleece. There are in some places of Africk certain Sheep, whose wools hat the colour of gold, and it may be, that from this occasion came the talk of golden sleects. It is said, that when Areus reigned in Peloponness, he vowed to Diana the best what soever should be brought that his said. forth in his flock, and it fortuned that there was yeared a golden Lamb, and therefore it made ing his vow, did not offer it, but shut it up in his cheft. Afterward when he gloryed and both ed of that matter, his brother Threftes greatly theyed him, and counterfeiting bye to his with Acropt , received from her the golden Lamb. Then being in possession thereof; he contradicted Arreus before the people, affirming that he that had the golden Lamb ought to be King, and to reign among them, and fo laid a wager of the whole Government or Kingdom thereof with Anni,

whereunto he yeelded, but Jupiter by Mercury discovered the fraud, and to Torefler took him to flight, and the Lamb was commanded to be offered to the Sun, and so I conclude this discourse with the verles of Marital care bearing horoschedung icis p.c. geteend unaccen-411.21 July 2 10

Mollia Phryxei (ecuifii colla mariti, Hoc meruit tunicam qui t ibi fape debit.

And feeing that I have entered into the discourse of these Poetical fables, or rather riddles, which Transmutation And seeing that I have entered into the discourse of these Poetical sables, or rather riddles, which Transmutative to be outwardly cloathed with impossibilities, I trust that the Reader will pive me leave a little on of Rams. To protected other Natrations, as that Applies transforming himself into a Ram, deceived and deflowed the Virgin Biddle, and the Ancients when they swore in jest and merginnent, were wone to swear by a Ram, or a Goole. When the Cyants waged war with the Gods (as the Poets write) took unso them several forms, and Jupiter the form of a Ram, whereof Ovid writteth, he was called Jupiter Ambolius.

It is a subject to the control of the several sound of the control of the

Therebe some that say that at what time Mercules desired very carnelly to so Jupiter, where unto Herodoims he was very unwilling; yet lie cut off a Rams head, and pulled off his thick woolly rough skin, and putitupon him, and fo in that likeness appeared to Hergeles, and for this gaple the thebanes to this

putit upon him, and so in that likeness appeared to Hercules, and for this gaple the Ibebanes to this day do not kill rams, but have them like lancified things, except one one one in a year, which they facrified Topiner, and say, that Tupiner was called Ammonian aries, because that his answers were my-Strabo. field, feered and crooked like a Rams horn.

Now concerning the facrificing of Rams, we know that Good himself in his Nord, permitted the Sacrificing of same to the people of the Tems and therefore it cannot be but marerial for us to adde something also Rams among to the discourse before recited in the story of the Sheep. The Sacrifice when they facrificed a Ram, the Genules, they roasted his intrails upon a foit or broath, and there were certain days of Sacrifice called Dies Annotes, wherein the principal Ram of every fock after compare or fighting was slain and facrificed for the safegard of the residue to Janua, and offices by the King:

Mamina lanigera conjuge debet Oyuani Jo

There was at Tanagrum a statue of Mercury, carrying a Ram (and therefore he is called the Kriophoros Humes, and by that name was worshipped of all the Tanagreans. Now there was a cunning workman of Calamis that made that statte, for they say, that when the City was grievously afflicted with a petilence, Mercury by carrying a Ramabous the walls delivered the fame; and therefore they did not only procure that statue for Mercury, but all ordained that every year one of their most beautiful young men should carry a Sheep on his shoulder round about the walls. In January they sacrificed Gyraldus. to supiter a Ram, and in February a Weather. Pliny writeth a strange Riddle, which is this; Cinnamountin Ethiopia gignitur, need, mettitur niss permiserit Deut, There is Cinamon growing in Ethiopia, and yet it is not reaped by men, except the God thereof gave permission or leave, whereby some underfland Jupiter, whom they called Sabin, and the Latinet, Alfabinus. Now Pliny faith, that if Pling. they had facificed forty and four Oxen, Buck-goats and Rams, with their intrails, they purchased leave to gather that Cinamon.

When the Romans Objected their Soli-Taurilia, they facrificed a Bull, a Gnat, a Ram and a Bord but unto Jupiter they, held it not lawful to offer a Ram.; Whiles offered to Neptune a Ram, a Bull and a Boar; and to conclude this discourse of the Rams sacrifices, I finde a story worthy the noting, recorded by Paulus Venetus, although it be altogether superstitious and full, of humane blindeness

There is a City of Tartary called Sachion, the Inhabitants whereof are Mabometans and Idolaters, asson of them have a son born, he presently commendeth him to one Idols tuition and protection or other; and that year together with his young son he nourished a Ram tamed in his own house; at the years end, he offered his Son and the Ram at the next seltival day, of that Idoll which he hath chosen; that is, he presenteth his childe and killeth his Ram, with great folemnity and ceremony in the presence of all his kindred, friends, neighbours, and acquaintence, and maketh earnest request to that Idoll to proted his son, and to guide and govern him all the time of his life, and therefore he hangeth up the flesh of that Ram in his presence, and afterward they take away again the same flesh, and carry it to another private place, wherewith the said Father and all the Kindred affembled do make a great and rich feaft, referving the bones for religions fake : And thus we fee how miserable men beguited with error, do not only make thew of falls Religion, but also play the hypocrites in that which is erroneous, thinking it an easie thing to deceive Al-

Concerning other things of Rams, they concur with that which is faid already of Sheep in ges neral, except their medicinal parts, which I will reserve to the due place: And herein adde one thing more of the horns of the Rhailan Rams, and in some places of Italy, namely, that after

Of the Steep west

they be five, fix, or feaven year old, they bring forth under their great borns two other little home. they be five, fix, or leaven year old, they and have but rough and courfe wooll. In other places, if at and that there trains are bear moe horns then two, it is prodigious and unnatural. And thus much of the Ram.

Of the WEATHER-SHEEP.

A Lthough this Beaft have all things in common with the Ram aforefaid, for he is a male fleep, and in nature different not from him, but only by the art of man. I might very well have confounded and conjoyned his story with the precedent: but feeing that all Nations do distinguish him from the Ram, because of one property or defect of him, for that he is not fit for generation, I will follow the stream, and not strive against my Authors, not swave from their method. Therefore in Latine it is call'd Vervex quafi verla natura, for that his natural feed is changed and turn'd in him, for his the same at is call a vervex quart verja natura, for that his hatter that the fine and gelded, being an Eunuch among Beafts. The frontes are taken away, and so he remainesth libbed and gelded, being an Eunuch among Beafts. The Grecians call him Krion Tomian, that is, a gelded Ram, for they have not one word to express him. The Grecians can film Arion Loman, that is, a gelfus rendeeth this reason thereof, Quia eum fequantur seni because the little Lambs love his company and follow him: and indeed by reason of his unappress to generation, the Ewes for sake his company, and the Rams cannot endure him, therefore instead of generation, the Ewes to take his company, and fome parts of Germany they call him Frifebling, and all the Hammel, which word feemeth to be derived from the Arabian word Lefan Albamel, a Ramstongue.

The Italians call him Castrone, Castrato, and Montone; the French. Monton; and the Illyrians, Beam.

Concerning the gelding of Rams or making of Weathers, I have not much more to say, then that which is already expressed in the general tractate of the Sheep, and for the manner I do refer the Reader, not only to that part, but also to the discourse of the Calf and Oxe, wherein I trust he shall finde satisfaction for this point, whether he will do it by a knife, by reed, by singer, or by hammer, for all those ways are in differently proponed. The best time for the gelding of Rams, ought to bein the wane or decrease of the Moon, at five months old, so as he may neither be troubled with extremity of cold or heat. And if it be not libbed at that age, but prolonged till two, three or four year old; we have shewed already the English manner for knitting of Rams.

Being thus libbed or knit, their horns grow not fo great as the other males ungelded, but their flesh, and lard, or sewet, is more acceptable then of any other Sheep what soever, except they be over old, for that it is neither fo moift as a Lambs, nor yet fo ranck as a Rams or Ewes, whence Bapilla Fins made these verses;

> Amiculus placeat, vel fi fine toftibus denut, Pinguior eft bado quin calet ella, vores. Hunc amo fi duri per pafcua monte anbelat. Maluero, fi auri vellere dives erit.

Platina also writeth thus of the flesh of Weathers, Vervecum caro satis salubris est & meller quan egnina, calida enim & humida babetur, ad temperamentum tendens, illa vero plus bumiditatit quam caliditati babet. That is to fay; The flesh of Weathers is wholesome enough, and better then the flesh of Lambs, because it is hot and moift, but that hath in it more moisture then heat and therefore this tendeth to a better temperament. Munster writeth, that the Inhabitants and people of Valuis take this fich of Weathers, and falt it, afterward dry it in the air where no smoke may come unto it; afterward they lay it up in straw, and so hold it much more delicate then that which is raised in the smoke.

As the fiesh of these Beasts groweth the better for their gelding, because they live more quitly and peaceably, for that their fore-heads grow weak and tender, and their horns small, so allo its reported that their tails grow exceeding large and fat. In some Regions, as in Arabia Falix, and other places, and because the report should not seem feigned by me, I will describe it in the Authors of the report own words, Paulus Venetus writeth thus of the Weathers of Scythia, and in the Region Cananda, fibject to the great Tartur. In Tartarie Regione Camandu artetes non minores afinis sunt, coude tan longe & late, ut triginta librarum pondus equent. In Camandu a Territory of Tariaria there are Rams like Affes in stature and quantity, whose tails are so long and broad, that they ballance in weight thirty pound. Varioman writeth ; In adibus regis Arabum fuife prapinguem vervecem, cujuscauda ades obesa fuit, ut libras quadraginta appenderet, & prope Reame urbem Arabia fallcis, vervecum genets theinulus, quorum caudam animadverti pondo effe librarum quadraginta quatuer, carent cornibus, adeoq; effe obef o pinquet ut wise incedere possunt. Circa Zeciam urbem Æthiopia verveces non vulli ponderosssima trabunt cauda, utpote pondo sedecim librarum. His caput & collum nigricant, cateris albi sunt. Sunt etiam verucci prosus albicantes, quorum cauda cubitalis est longitudinis modo elaborata vitis, palearia ut bubat a mento pendent, que bumum prope verrunt. That is to say, In the souse of the king of Arabia, there was a Weather very sat, whose tail weighed forty pound, and near unto Reamia, 2 City in Arabia talia color them. City in Arabia ralle, there are a breed or race of Weathers, whose tails for the molt part weighted fo part weighed four and forty pound. They want horns, and are fo fat that they can fracely go. Also about the City Zeela in Ethiopia, the Weathers draw long tails, weighing fixed pound. Whereof some have their heads and neck black, and all the other parts of their body body white, some or them again all white, having a tail but of a cubit long, like a curious and planted Vine, their creeks and hair hanging from their ohin to the ground. Thus far of the Arabien Weathers. Of the Indians he writeth thus in another place: Circa Tanafuri urbem India tama est pecudum copia ut duodeni verveces singulo aureo vaneunt. Conspiciuntur illic verveces alii, cornua haud absimilia danu babintes, nostrie longe majores ferocioresque. Canda vervecum in peregrinu regionibus tanta sunt. quantus nullus apud nos vervex. Contingis boo quia bumidissimum boc animal, & inter quadrupedia frigidissimum, cunqu cetera offe extendi nequeant, ne pinguedine immenfa., extenfis etiam offibus & nervil non parum, que humida natura velut pifces semper inoremente apta funt. That is, About the City Tarnasarin India, there is fuch great plenty of Cattel, that they fell twelve Weathers for a noble, and yet there are Weathers which have horns like to the horns of Deery being longer; greater, and fiercer then our Rams and their tails in forein and firange Countries are fatter then any Weathers among us; and the reason hereof is, because it is the moultest and coldest creature among all four-spoted Beatts: and because the bones cannot be enlarged to receive that moithure, and left that it should destroy the Beast by experance and abundance, therefore nature hath provided this remedy to fend it forth into the tail, whereby in flesh and fat it groweth exceedingly, 'the bones and nerves whereof are not's little extended, for they are also of a moilt nature like fishes, and therefore apt to encrease and grow 5 1 Bee

Thus much fay they of the tails of Weathers, now I know fuch is the folidity of divers Readers and people, that for these reports, they will presently give both these Authors and me the Whet Rone for rare untruths and fictions; I do not marvail, for fuch (I dare affure my felf) do not believe all the miracles of Christ, having short and shallow conceipts, measuring all things by their own eyes, and because they themselves are apt to lye for their profit; therefore they are not ashamed to lay like imputations upon honest men, vet I could shew unto them as great or greater wonders in our own Nation (if they were worthy to be confuted) for which other Nations account us as great liers (nay as these Infidel foots) do them, and yet they are common

The use of the several parts of this Beast, is no other then that which is already reported of the Sheep and Ram, and therefore I will not fland to repeatthat which is fo lately related, and for the remedies or medicinal vertues. I finde few that are special except those which are common between this and other of his kinde. It, feemeth by Plante, this de Weather Sheep is accounted the most foolish of all other, a coward and without courage, for speaking of a mad dotish fellow, he writeth thus; Ego ex hac hains verveceal volo erogitare, meo minora quod fiv fallum fille. That is I will demand of this blockish Weathers picture, (meaning his Booksh fervant) what is become of my younger fon.

a name for it, and it is probable, that feeingit is an unperfect Beaft, God forbade it into bis fanduary: when the Gentiles brought a Lamb at the side of a Weather to be siderificed, they called them Ambegni, and so also a Lamb and an Ox. Aiciatus maketh this pretty emblem of a Weather which with a Hedg-hog is the Arms of Millain, wherewithal I will conclude this discourse;

Praterea teneri tremplie in voaibme badi, Corniferas norunt matres, agniq; petulci.

S. Ambrofe writeth thus of the inclination of a Lamb to his mother, and the love of her milk. At. D. Amoroje WELLELL CHIE Cocem parentis, cum a maire quandog; aberrat, frequenter eam baletu exc. nut simpliquimes ovium recegnojent votem professionat ad eam : nam quamois citi & porti desiderio te tat, multifq; licet versetur in millibus quium, sessionat ad eam : nam quamois citi & porti desiderio te tat, mutsiya, ticte verjesur ote autora, licet humore lattie gravida exundent, feliufq; materni latti fontes re. netur stanjourrit tamen auera north, mer nand erreth many times from his mothers fides, having quirit. The Lamb is a most fimple Beast, and erreth many times from his mothers fides, having quirit. Ine Lamb is a most simple bean, and the him out but by bleating; for in the midst of a no other means to provoke his mother to seek him out but by bleating; for in the midst of a no other means to provoke his independent, and so hatteneth to her when it hearth her; thousand Sheep it different the voyce of his parent, and so hatteneth to her when it hearth her; thousand once it directions poor Beaft, that although there be many other Ewes which give fuck, for such is the nature of this pool tasks of their mothers fountains, and the Eweknoweth her yet they pass by all their udders to tasks of their mothers fountains, and the Eweknoweth her young one by smelling to the backer part: the Lamb all the while it sucketh waggeth and playeth with the tail. When the Lamb is newly faln, in some Countries they put them up close into a stable for a day, or two, or three, till they grow strong, and are well filled with Milk, and know their Dams, and so long as the Rams feed with the females they keep in the Lambes, that so they may be clear day and night from all violence of the Rams, for at night they lodge single and alone by their dams sides. The like regard is to be had if they do not suck their mothers, they must snoint their lips with butter or Hogs-greafe and milk, and for two months after their yearing it is not good to rob them of any milk, but suffer them to suck all that their Dams can breed, for so their Lambs will grow more strong, and also their wooll more fine. And when they are to be weared, they must first of all be brought out of love of their mothers when they are their separation they languish, and sofe all natural by, whereby they are milk, lest after their separation they languish, and sofe all natural by, whereby they are never likely to come to good: afterward let them be herded or drove to field, but after their yearing it is profitable when they are a week old to give them Salt, and fo the fecond time after they he fifteen days old. It is never good to nourish the firstling or first Lamb of an Ewe, for that commonly they are weaker and more tender then any other, but the best to be nourished They are also the best and strongest which are bred in the Spring time, and much fatter, and more

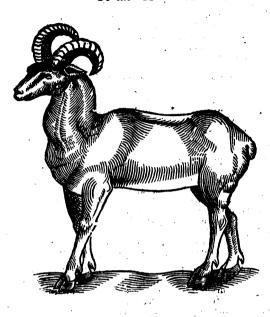

able then those which are yeared in the Autumn. And yet there are some that affirm, that they which are bred in the Winter are fatter then those which are bred in the Summer, for if strength of nature beable to live out the Winter an the first yearing, much more will they beable to dure when they are elder: in the first sucking of a Lamb, the beestings must be milked out, for they are apt to fall into many diseases, such as are already mentioned in the discourse of the Sheep generally to preserve them in-health, they give them Ivy when they are vered with an Ague, and separate them from the Bwes, lest by sucking they infect their mothers, then might they be milked alone, and their milk mixed with rain water, and fo given to the fick Lamb, and if they will not take it willingly, then infuse icinto her throat with a horn, and if they be troubled with Scabs, take Hylop and Salt, of each an equall quantity; and if the mouth be broken out and bliftered, then rub the afflicted place therewith, afterward wash them with Vinegar, and then anoint them with liquid Pitch and Hogs grease; there must be also a care had to keep them from

Concerning the use of their several parts, we have already shewed in the story of Sheep, and therefore we need not prosecute it in this place. Their skins are fitter to clothe men, then theskins of their dams, and therefore the Hebrews fay that they are fittest for the garments of young men, for they encrease their strength and natural vigor. The Skinners make great account of these lamb skins, and use them for the linings of many garments, such as are killed they call the skins of stages ter-lambs. The best are brought out of train and Apulta, and all those parts which are beyond Row; Narben, and Spain, yeeld plentiful ftore of black Lambs, and their skins are fold by Merchants: and white skins are plentiful in England.

Their fiesh is nourishable and convenient for food, but yet inferiour to Weather Motton for that it containeth more moisture then heat. To conclude this discourse of the Lamb, the grates bonour thereof is, for that it pleafed God to call his bleffed Son our Saviour by the name of a Lamb in the Old Testament, a Lamb for Satrifice, and in the New Testament, stiled by Total Lamb of God that taketh away the first of the world. There is a proverb in Greek, Anthe is is alocative off, A Lamb hath spoken this unto you, and it was a proverbial speech to express a divine Parallelian of Santa March 1906 and the waste proverbial speech to express a superscript of Santa March 1906 and the waste proverbial speech to express a superscript of Santa March 1906 and the waste proverbial speech to express a superscript of Santa March 1906 and the waste proverbial speech to express a superscript of Santa March 1906 and divine Revelation of fome business, that mencannot attain unto by ordinary and common mean, because either it is conceased, or else it concernets things to come. For it is reported by suita, that once in Egypt there was a Lamb that spake with a mans woice, upon the Crown of his head was a regal Servent having the concerned the concerned that the concerned that the concerned the concerned that the regal Serpent having Wings, which was four subled long, and this Lamb spake of divers sums

The like is faid of another Lamb that spake with a mans voice, at what time Romalin and Roman were born, and from the some manufacture with a mane voice, at what time Komum and your were born, and from the some conclude with the verse of Valentus: Asperanus purious control and leaves. There is in Asperanus purious control and leaves. There is in Asperanus purious control and leaves. There is in Asperanus purious of a little Lamb, the people of the and it is reported by Sigismumdus, in his description of Assessors, that it is generated out of the earth earth like a reptile creature, without feed, with dam without copulation, thus liveth a little while and never stirreth far from the place it is bred in, I meanit is not able to move it self. but eateth up all the graffe and green things that it can reach, and when it can finde no more, then it dyeth.

Of the : MUSMON.

Have thought good to referve this Beast to this place, for that it is a kinde of Sheep, and there-Ifore of natural right and linage to this story, for it is not unlike a Sheep, except in the wool which may rather feem to be the hair of a Goat; and this is the same which the antients did call Puny. Umbrica eves, Umbrian Sheep, for that howfoever it differeth from Sheep, yet in simplicity and other inward gifts it cometh nearer to the Sheep. Strabo calleth it Mulmo, yet the Latins call it Mulimon. This beaft by Cato is called an Asse, and sometimes a Ram, and sometimes a Musmon. The picture which here we have expressed, is taken from the fight of the Beast at Caen in Normandy, and was afterwards figured by Theodorm Beza. Munster in his description of Sardinia remembreth this beaft but he faith that it is speckled, whereat I do not much wonder, seeing that he consessed that he hath all that he wrote thereof, by the Narration of others.

Some say it is a Horse or a Mule, of which race there are two kinds in Spain, called by the Latins, Afinicones, for they are very small; but I do not wonder thereat, seeing that those little Horses or Mules are called Musimones, because they are brought out of those Countries where the true Musimones (which we may interpret wilde Sheep, or wilde Goats) are bred and nourished. There are of thele Mulmons in Sardinia, Spain, and Corfica, and they are said to be gotten betwixt a Ram and a Goat, as the Cinirus betwixt a Buck-goat and an Bwe. The form of this Beaft is much like a Ram, faving that his breft is more rough and hairy his horns do grow from his head like vulgar Rams, but bend backward only to his ears : they are exceeding swift of foot, so as in their celerity they are comparable to the swiftest Beast. The people of those Countries wherein they are bred, do we their skins for breaftplates. Pliny maketh mention of a Beast which he called Ophion, and he faith he found the remembrance of it in the Grecian books, but he thinketh that in his time there was none of them to be found in the world : herein he speaketh like a man that did not know G O D, for it is not to be thought, that he which created fo many kinds of beafts at the beginning, and conferred of every kinde two, male and female at the generall deluge, would not afterward permit them to be destroyed till the worlds end, nor then neither: for seeing it is apparent by holy. Scriptures, that after the world ended, allocreatures and beafts shall remain upon the earth, as the monuments of the first fix days works of Almighty God, for the farther manifestation of his glory, wildom, and goodness, it is an unreasonable thing to imagine that any of them shall perish in

general in this world. The la dinians call the fe beatts, Mufflo, and Brim Mufflo, which may eafily be derived from Ophion, therefore I cannot but consent unto them, that the antient Ophion is the Mine mon, being in quantity betwire a Hage and a Sheep, or Goat, in hair refembling a Hart, and this mon, being in quantity seeman and this Bealt at this day is not found but in Sardinia. It frequenteth the steepest mountains, and therefore. Beatt at this day is not found but in substitution field thereof is very good for meat, and for that liveth on green graffe and fuch other hearbs. The flesh thereof is very good for meat, and for that liveth on green grane and nutti other near b. The near Boethim in his description of the Hebridian Islands cause the inhabitants seek after it to take it. Hellor Boethim in his description of the Hebridian Islands faith, that there is a Beast not much unlike to Slicep, but his hair betwixt a Goats and a Sheeps. being very wilde and never found or taken but by hunting, and diligent inquisition. The name of the Island is Hielbe, and the reason of that name is from his breed of Sheep called Himb in the Vulgar tongue, yet those Sheep agree with the Musmon in all things but their tails, for he saith, that they have long tails reaching down to the ground, and this name cometh from the German word they have long tans reaching down to the godine in general. Now followeth the conclusion of Herd a flock, and thereof frir cometh for all Sheep in general. Now followeth the conclusion of their flory with their medicinal virtues.

The medicines of the Sheep in general.

Galen.

Pliny.

The bodies of such as are beaten, and have upon them the appearance of the stripes, being put into the warm skins of Sheep when they are newly puld off from their backs, eateth away the outward pain and appearance, if it continue on a day and a night. If you feethe toge. ther a good feason the skin of the feet, and of the fnowt of an Ox or a Sheep till they be made like glew, and then taken forth of the pot and dryed in the windy air, is by Silvius commended a.

gunit the burftness of the belly.

The bloud of Sheep drunk, is profitable against the falling sickness: Also Hippocrates prefcribeth this medicine following, for a remedy or purgation to the belly, first make a persume of Barly Reeped in oyl upon some coles, and then seethe some Mutton or Sheeps fielh very much and with decoction of Barley set it abroad all day and night, and afterward seetheit again and eat or sup it up warm, and then the next day with Hony, Frankincense, and Parsely, all beaten and mingled together, make a Suppository, and with wool put it up under the party, and it shall ease the diffres. The same flesh burned and mixed in water by washing, cureth all the maladies or diseases arising in the secrets, and the broth of Mutton, Goose, or Veal, will help against the posson by biting if it be not drawn out by supping glasse nor by horse-leach. The sewet of a Sheep melted at the fire, and with a linnen cloth anointed upon a burned place, doth greatly ease the pain thereof.

The Liver with the fewet and Nitre causeth the scars of the flesh to become of the same colour that it was before the wound, it being mixed with toafted Salt, fcattereth the bunches in the fielh, and with the dust of womens hair, cureth fellons in fingers, or any part of the bodies. The fewet of Sheep or Goats, being mingled with the juyce of Rhenish wine grape, and shining horse sites, doth without all scruple or doubt, ease the pain of the milt, if it be anointed thereupon. The fat of

Sheep doth very easily expell the roughnels of the nails.

The fewet of Sheep or any other finall beaft, being mixed with the herb called Melander, and pounded with Alum, afterward baked together, and wrought into the manner of a Seat-cloth, doth very much ease those which are burned by fire in any parts of their body, being well applyed thereto. The sewet of a Sheep being also applyed to those which have kibes in the heels, or chilblanes in their feet, will prefently heal them. The lewet of a Sheep mixed with womens hair which is burnt to powder, doth very effectually in their feet, will presently heal them.

cure those which have their joynts or articles loofe, being anointed thereupon.

The fat of Goats or Sheep moistned with warm water, and boiled together, being apointed upon the eyes, doth speedily cure all pains, spots, or blemishes in the same whatsoever. The far of a Sheep boyled and drunk with harp wine, is an excellent remedy against the cough. The same medicine is alfo effectually used for the expelling of horses coughes. The sewet of a Sheep being boyled with tharp wine, doth very speedily cure the obstruction of the small guts, bloudy flux, and any cough of what continuance foever.

Marcellus.

The fame being in like manner drunk while it is hot, is accounted for an excellent remedy against the Colick passion. The sewet of a Sheep, or of a Male goat, being mingled with the sime or dung of a Female-goat, and Saffron, dorh very effectually cure those which are troubled with the Gowt or swelling of the joynts, being anointed upon the place so grieved. It is also reported that the outward fewer of Sheep (between the flosh and the skin) between the hinder legs, is very wholetom for the curing of fundry pains and diseases.

Dio corides.

Sheeps lewet or the fat of any other small beast being gathered from the reins, mixed with falt, and the duft of a pumice ftone, being applyed unto the yard of any man, doth feedling cure all pains, aches, or swellings therein. The fat of Sheep which is gathered from the caul or cell, being minged with the aforeigid medicines do heal all other pains in the privy members of man or woman whitfoever. The fame fewer doth flay the great excess of bleeding in the nofe, being anointed

Sheeps fewer being mixed with Goofe greate and certain other medicines, being taken in drink, doth help abortments in women. The liver of a Sheen is accounted an excellent remedy against the shedding of the hair on the eye lids, being rubbed thereupon. The same being also baked or boyled, is accounted very profitable for Sheeps eyes, if it be well rubbed thereon. The marrow of Sheep is very good to anoint all aches and fwellings what loever.

The horns of Sheep or of Goats pounded to powder, mingled with parched Barley which hath Hippocrates. been well shaled, and altogether mixed with Oyl, being taken in a certain periume, doth help Women of their feconds, and restoreth to them their menstruall fluxes. Sheeps hornes burned and heaten in wine untill they be tempered like a pill, the right foot being anointed with the right horn. and the left foot with the left, will mitigate the forrow of those which are very fore pained and troubled with the gowt.

Rheumatick, or watry eyes, being anointed with the brains of Sheep are very speedily and Rasis. effectually cured. The brains of the same beast is exceeding profitable for the breeding of young hildrens teeth, being anointed upon the gums. The lungs or lights of small beasts, but especially of a Ram, do restore the true skin and colour of the slesh, in those whose bodies are full of chops

The lungs or lights of the same beast concocted upon the uppermost skin of any man, and Pling. applyed very hot thereunto, do diminish the black or blew places therein, which have been re-

ceived by the occasion of any stripes or blows.

The lungs of Sheep being new taken out of their bellies, and applied while they are hot unto bea- Marcellus. ten or bruifed places, doth quite abolish the fignes thereof, and in short space procure remedy. The lungs of Sheep or small Cattle being roasted and taken by any man before he drinketh, will resist all kind of drunkenness.

The lungs of Sheep taken out of their bellies, and bound about the heads of those which are phrensie while they are hot, will very speedily ease them of their trouble. The lungs of Sheep being hot and bound to the head, is accounted very profitable for those which are troubled with the pestiferous disease called the Drowsie evill. 11 b

The lungs of Sheep being boiled with Hemp-seed, so that the flesh be eaten, and the water wherein it is fod be drunk, doth very effectually oure those which are grieved with excoriations in their bellies, and the bloody flux. The lungs of Sheep being applyed while they are hot, doth heal the Gowr.

The liver of white Sheep well boiled, made moift with water, throughly beaten and applyed Hippoerales. unto the eye-lids, doth purge Rheumatick eyes, and cause them to be of a more clear and ample fight. If a woman bearing young, shall be puffed up with winde, give her the liver of a Sheep or Goat beaten into small powder while it is hot, being pure and without mixture for four dayes togaher to eat, and let her drink only wine, and this will very speedily cure her.

The gall of a Sheep mingled with hony, healeth the Ulcers of the ears, and procureth eafie Pling. baring. The gall of a Sheep mingled with sweet wine, if it be rempered in the manner of a glyster, andafterwards rubbed upon the ear-laps, the ulcers being quite purged, will procure a speedy cure indremedy. The gall of the same beast distilled with a womans milk, doth also most certainly heal their cares which are broken within, and full of mattery corruption.

The gall of a Sheep being mixed with common oyl, or oyl made of Almonds, doth also halthe pains of the ears, being powred therein to. Cankers, or the corrosion of the sless, being anointed with the gall of a Sheep, is very speedily and manifestly cured. The Dandrasse or sturges of the head being anointed with the gall of a Sheep mixed with fullers-earth which is hardned together while the head burneth, are very effectually abolished, and driven quite

The gall of little cattle, but especially of a Lamb, being mixed with hony is verily commended or the curing of the Falling evill. The mile of a Sheep new taken out by magicall precepts is accounted very good for the curing of the pain in the milt, he faying which may be healed that he maketh a remedy for the milt. After these things the Magicians command that the grieved Pling. party be included in his Dortor or Bed-chamber, and that the doors be fealed up, and that a verfe be spoken thrice nine times. The milt of a Sheep being parched and beaten in wine, and afterward taken in drink, doth relist all the obstructions or stopping of the small guts. The same being used wthe like manner is very medicinable for the wringing of the guts.

The dust of the uppermost of a Sheeps thigh, doth very commonly heal the loofeness of the Marcellus. joints; but more effectually if it be mixed with wax. The same medicine is made by the dust of Sheeps jawes, a Harts horn, and wax mollified or affwaged by oil of Roses. The upper parts of the thighs of Slieep detocted with Hemp-feed, do refresh those which are troubled with the bloudy flux, the water whereof being taken to drink. For the curing of a Horse waxing hot with weariness and longitude of the way; mingle Goats or Sheeps fewer with Coriander, and old dill, the Coriander being new gathered, and diligently pounded in the juice of Barley, and to give it throughly strained for three dayes together.

The buckle-bone of a Sheep being burned and beaten into small dust, is very much used for the miking of the teeth white, and bealing all other pains or aches therein.

The bladder of a Goat or Sheep being burned and given in a potion to drink, made of Vinegar and mingled with water, doth very much avail and help those which cannot hold their water in the installation was a superior water in the superior was a ter in their fleep. The skins which cometh from the Sheep at the time of their young, doth very, Galen. much help very many enormities in women, as we have before rehearfed in the medicines arifing

The

Marcellus.

Pliny.

Pliny.

Margellus.

Furneriu.

Pliny.

Crescentien.

The milk of Sheep being hot, is of force against all poysons, except in those which shall drink The milk of Sheep being not, is of following and Libbards bane. Oatmeal alfo doth cure a long linging a venemous fly called a Wag-leg, and Libbards bane. Intil all the water be balled. a venemous my caneu a vvag-1eg, and the cups of water, until all the water be boyled away; but difease, a pinte of it being sodden in three cups of water, until all the water be boyled away; but disease, a pinte or it being jouden in entered for Sheeps milk or Goats, and also Hony every day to-afterwards you must put thereunto a pinte of Sheeps milk or Goats, and also Hony every day to-

gether.
Some men do command to take one dram of Swallows dung in three cups full of Goats milk or Some men do command to take one dram of Swallows dung in three cups full of Goats milk or Sheeps milk being taken Slieeps milk before the coming of the quartern Ague. Goats milk, or Sheeps milk being taken Sheeps milk before the coming of the quarters and in the mouth, is very effectual against the when it is newly milked from them, and gargarized in the mouth, is very effectual against the when it is newly miked from them, and gainst the spains and swellings of the Almonds. Take a pinte of Sheeps milk, and a handful of fifted Aniseeds, pains and twenings or the Almonds. Take a price and let it be drunk, and it is very good to and let them lettine together, and which to Goats milk and Sheeps milk, and so being drunk, is very loosen the belly. Medicines being made of Goats milk and Sheeps milk, and so being drunk, is very

good for the mortness of breath.

A hot burning gravel from being decocted in Sheeps milk, and so given to one that hath the A not out only graves atom to the Bloudy flix, is very profitable to him. Goats milk or Sheeps milk given alone luke-warm, or fod-Bloudy nix, is very profitable to those that are brought very weak with the passions of the den with Butter, is very promised to wash ones face with Sheeps milk, and Goats milk, is very good stone, and fretting of the guts. To wash ones face with Sheeps milk, and Goats milk, is very good tone, and fretting or the guts. To wall ones fall that is, the last milk that they give that day, is very good to loofen the belly, and to purge choler. The hairs of the head of a Dog burned into ashes; or the gut of the privy place sodden in Oyl, is a very good and soveraign remedy for the aines; or the gut of the privy place loaden welling of flesh over them, being anointed with Butlooseness of the flesh about the nails, and for swelling of flesh over them, being anointed with Butlooseness of the flesh about the nails, and for swelling of flesh over them, ter made of Sheeps milk and Hony. An Oyl fodden in Hony, and Butter made of Sheeps milk, and ter made of Sheeps milk and rootly. All Oyl Cheefe made of Sheeps milk, is very Hony melted therein, is very profitable to cure ulcers. Old Cheefe made of Sheeps milk, is very good to frengthen those which have been troubled and made weak with the Bloudy fix. Again, old Cheese made of Sheeps milk, taken in meat, or scraped upon it, and being drunk with Wine, doth

case the passion of the Stone.

There was a certain Physician being skilful in making medicines, dwelling in Afia by Hellespont, which did use the dung of a Sheep washed and made clean in Vinegar, for to take away Warts and knots rifing on the flesh like Warts, and kernels, and hard swellings in the flesh. Also he did bring Ulcers to cicatrifing with that medicine which were blafted or scalded round about, but he did mingle it with an emplaister made of Wax, Rosin, and Pitch.

Dioscorides, Pliny.

Vegetim.

Pliny.

Marcellus.

The dung of Sheep also doth cure pushes rising in the night, and burnings or scaldings with fire, being smeared over with Vinegar without the commixture of any other things. The dung of Sheep being mixed with Hony, doth take away small bumps rising in the flesh, and also doth diminish proud flesh : and also it doth cure a disease called an emmot, as Rasis and Albertus say. The dung that is new come from the Sheep being first worked in thy hands, and applyed after the manner of an emplaister, doth eat away any great warts growing in any part of thy body. The dung of a Sheep being applyed to thy feet, doth consume or waste away the hard flesh that groweth thereon.

Sheeps dung doth also cure all kinde of swellings that are ready to go into Carbuncles. It is also good being fodden in Oyl and applyed after the manner of an emplaister, for all new wounds made

with a fword, as Galen faith :

Aut fi conclusum fervavit tibia vulnus, Sterens ovis placide junges, adipefq, vetuftos, Pandere que poterunt bulcus, patuloq; mederi.

The dung of Sheep and Oxen being burned to powder, and smeared with Vinegar, is very good against the bitings and venemousness of Spiders; And again it is very effectual being new come from them, and fodden in Wine against the stingings of Serpents. Sheeps dung being mixed with Hosy,

and applyed to Horses whose hoofs are broken, is very effectual. The dung of Oxen and Sheep being burned to powder, and intermixed therewith, is very effe-Qual against Cankers, and also the bones of the Lambs thighes, being burned into ashes, is very profitable to be applyed to those ulcers which cannot be brought to cicatrise. Also Sheeps dong being made hot in a Gally pot, and kneaded with thy hands, and afterwards applied, doth presently cease the swellings of wounds, and doth purge and cure Fistulas, and also diseases in the

The Oyl of Cypress and Hony, is very effectual against Alopecia, that is, the falling of of the hair An emplaiter made of Sheeps dung, and the fat of a Goofe and a Hen is very effectual against hair rifing in the root of the ear, as Rafis and Albertus fay. Sheeps dung being applyed hoe, if very effective land are the first the first

ctual against the swellings of womens paps or dugs. Sheeps dung being put into the decoction of Wood-bine, or Hony and water, and so dung very profitable against the Yellow-jaunders. If the Spleen be outwardly anointed with Sheeps don't and Vinegar, it doth leffen the rifing of it. The dung of Oxen and Sheep which is very moift, doll ease all manner of Gouts The thin or outmost skin which is taken from the privy part of Sheep, is very profitable against the disease called the flowers in Women. The dung also hath the sum operation. The dung also hath the flowers in Women. operation. The Urine of Sheep is very profitable against the Hydropsie being mixed with Hony.

But Raft faith otherwise. But Resis saith otherwise, which is, that the dung being drunk with Hony is available against the Dronsie. Dropfie.

Obsentus. Rafis.

Pliny.

Albertus.

Totake the weight of a penny of Ox dung and Sheeps dung, and a grain of Myrrh, and two onness and a half of Wine, doth stay or relist the coming of the Kings evill. The filth which is Pinn. rakenout of the ears of these beatls is said to be very effectual against the flowers. It doth make a barren woman to conceive with child alto, as Serenu faith in thefe Verles :

> Pendentem (pumam molli deducet ab ore. Aut ovie in figbulis; fractes cum ruminat berbas, Ala, illam memini mifto potare falerno.

The sweat of a Horse being made warm and mixed with Vinegar, is very convenient against Sylvaticus. the Falling fickness, and is used against venemous bitings. And also the sweat of Sheep is very much profitable unto it. If the boof or anche-bone of an Ox chance to be cut with a Plough Columbia there, Pitch and fat with Sulphur is very good, but you must roul round about the wound

Unwashed Wool doth very much prosit those that are frenzie being applyed with a sume that floppeth humors from coming down from the head. Unwashed Wool being bound upon the forehead, is very good for the waterish humor that floweth out of the eyes. Unwashed Wool being heated in Vinegar, and proffed into the ear, and afterwards the top of the ear being stopped with that Wool, will by little and little ease the pains in the pars. Unwashed Wool dipped in Oyl of Roses and put into the Noûrils doth flay bleeding at the Nofe. Unwashed Wool being plucked from the privy parts of Sheep and moistned in Oyl of Roses, is very good to stop the fluxes of bloud in any part of mans body.

Unwashed Wool being tyed on the outside of the knuckles or joynes, doth stop the bloud or Marcellus. humors from running to and fro. It is also said to be very good being dipped in Hony (and so rubbed upon the teeth or gums) for to make one breath or gaspe easier. Unwashed Wool being smeard over with Hony, and rubbed upon the teeth, doth make them look white prefently after. Unwashed Wool with a little salt put to it and tyed close in a linnen cloth, and so scorched and heaten to powder, is very good to keep the teath from pain, being rubbed upon

Unwashed Wool being mixed with Miter, Brimstone, Oyl, Vinegar, and with Tar, being ap- Gales. plyed twice a day, doth eate all pains of the knuckles and anokles. Sheeps dung and other things with unwalked Wool is very effectuall against the stone in the bladder, as it is spoken above in thecure and remedies of Sheeps dung. Unwasht Wool doth cure all the diseases in the privy parts of memor women being applyed thereunto. The black Wool of Sheep, is very profitable for all swellings in the stones or cods of men. The gall of Buls put upon unwashed Wool, is very profitable for the slowers of women. Unwashed Wool being applyed unto those parts that are dead, doth very much good unto them.

White fleeces of Wool being either applyed alone, or with Brimstone, is very good for hidden pains and griefs. Fleeces of Wool given in a fume with Brimthone, is very good for the remedy of the Kings evill. Wool being dyed of a purple colour, and fo applyed, is very good against the pains of the ears. There are moreover very many remedies madeingainst diseases by unshorn Wool. belides the expelling of cold, being taken in Oyl, Wine, or Vinegar, for as much as the same being applyed to the members , which are out of joynt, or to any pains in the iNerves, doth very speedily and tenderly heal the same.

Sheeps Wool being mixed with Herbgrace and Sheeps greate, is wery much applyed unto those which are bruiled, or have hard swellings in any parts of their body. Unwashed Wool being often put into the fores which are bitten by mad Dogs, doth perfectly cure them in feven

Sheeps wool in cold water doth bring remedy unto those whose skin is loose about the Nailes. Pling. The same being steeped in hot Oyl may be well applyed unto most or running sores: but mingled with Hony is very medicinable for old forse or fellere; and fleeped in Wine, Oyl, Vinegar, or cold water, doth heal any new wound which feemeth to bring the wounded party in danger of death. Dioforides doth alforaffirm that Sheepe wool being unwashed is course ble for all kinds of

wounds whatloever.

The fame is very much applyed unto these whose bones are builted or beoken; if it be mixed with Serenus.
The fame is very much applyed unto these subsections in summable. The Carthedian she brains of a wanton Dog, and bound hard upon the grieved place in a lime model. The Carthedian she bear and on lette unwashed Wool of Lambs of she ago of four years, for the curing of the Temple place of the description of of an Ox take hard Pitch and Bason greafs mingled with Brimstone, and nowled in unwashed Wool, and mark the wounded place with all these together with a fery hot iron, and it will bring

preferchel and remedy.

Unwashed Wool being taken in some certain perfume doth cure those which are Beanticob,

Solven wort being boyled in Hony and mixed with lunwashed Wool which was stepped in Oyl or Wine is very good for the afordisthed difease, being bound about the forepart of the head in a based linnen cloth. Sheeps wool being also applyed in the fame manner, it an excellent cuts for those which are troubled wich a certain watery rheam running in the eyes, as allothe ach in the forepart of the head. ាំ មុខ ខ្លួនវិទាក់ ខេត្ត សំពីកំនៃទី

Unwashed

Unwashed wool boyled in Vinegar and applyed unto the cares, doth expell all filth or moifure therein, and the iffue thereof being afterwards ftopped with the same kind of wool, is very fpeedily cured. Sheeps wool is also very good and effectual for the curing the pains of the ears which are but new coming upon them. Unwashed wooll being mixed with Oyl of Roses and put into the Nostrils of any man, the ears being stopped close with the same kind of wool, will stay the issuing of the bloud at the Nose, how fluent soever it be.

The History of Four-footed Beasts.

The same being also steeped in Oyl and put in the Nose, doth restrain the bleeding thereof. Wool being plucked or wrested from the back of Sheep, and kept unwashed, doth cohibite the aboundance of bloud, being steeped in pure liquid Oyl of Roses. The same being taken from the back of a Ram doth flay over much bleeding at the Nose, the joynts of the fingers being bound back of a Ram doth tay over much bleward wool freeped in Hony and rubbed upon the teeth as hard as possible can be suffered. Unwashed wool freeped in Hony and rubbed upon the teeth or gums, doth make the breath of any man more fweet and delightful then it hath been accultomed. or guns, doth make the faid manner, doth procure a very great whiteness and clearness in the

etil. Unwashed Wool being parched and bound, in a linnen cloth, a third part or portion of sak being afterwards added thereunto, and all beaten together in small dust or powder, and rubbed upon ing afterwards added thereunto, and all beater together. Unwashed Wool being dipped in Nitre, the teeth-will keep them from any pain or grief therein. Unwashed Wool being dipped in Nitre, Brimitone, Oyl, Vinegar and liquid Pitch, being all boyled together, doth asswards all pains in the hanches or loins whatsoever, being twice a day as hot as possibly may be suffered applyed thereunto. nanches or joins what joever, oring twice a day as and other things, is very much applied against Sheeps dung mingled with unwashed wool and certain other things, is very much applied against that troublefom and painful difeate called the stone or gravel.

Unwashed wool in cold water, doth cure diseases in the privy parts of any man or woman what. unwained wool in cold water, doctreamed in the party paths of any filed what foever. The wool of black Sheep is commonly reported to be very commodious and helpful for those whose Cods or stones are much swelled. The gall of an Ox being mixed with in washed wool doth help the purgation or mentrual fluxes of women; but Olympies the Thebane, affirmeth, that doth neip the purgation or memtrual makes of wonten; but offmers the abream, animeta, that Hylopand Nitre ought to be mixed with this wool for the helping of the same. Unwashed wool for the helping of the same. being applyed unto the secret parts of women, doth cause a dead childe to come forth. The fame doth also stay the issues of women. The pure or clear sleeters of Sheep either applyed by themselves, or mingled with Brimstone, do cure all hidden or secret griefs what soever and thing commendeth them above all other medicines whatfoever. Fleeces of wool mingled with quickflyer, are very profitable to be taken for the same diseases in certain persumes. The root of a Mallow heing digged up before the rifing of the Sun, and wrapped in undyed wool, doth cure the Webs or mattry impostumes of those Sheep which have lately brought forth young. Sheeps wool being dyed in purple colour, doth very much profit the ears a but some do steep it in Vinegar and Nure, to make the operation more effectuals to describe and

The dust of wool being burnt, doth bring forth the matter or corruption lying hid under fab. restrain the swellings in the flesh, and bringeth all Ulcers to a scar. Wool being burnt hath tharp force, and likewise hor together with the ilenderness of the parts, it doth therefore very petally clense and purge the fores in the flesh, which are moist and too much full of matter. It is also put in drying medicines. It is burned as if there were many other things in it, filling a new por, which may be covered with a cover which is bored through with many holes like unto a live. The powder of unwashed Wool is anothered upon divers fores and is very curable for them as brapowder of unwained wood is anointed upon divers fores and is very curable for them is ordered, new wounded, and fores half burnt, and it is used for the curing of the distant in the eyes, as also in the easing of the Fisulaes and corrupt mattery fores in the easing of the Fisulaes and corrupt mattery fores in the easing of the Fisulaes and corrupt mattery fores in the easing of the powder of unwashed wood is clensing, and it doth very effectually purge the easing or cheek-bals. It doth also clense and cure for the most part all diseases, as Serenia sath in these Verses;

1 parid The hairs which grow about the fecret hole of Sheep being Burned, bearen and drink in fuelt wine, doth help the shortness of the breath, and ease the pursiness of the stomath. The wood of a wine, doth neip the mortners of the preath, and take the puriners of the nomath. The thirdestand burnt and afterwards dipped in Vinegar, little theep being pulled from betwire his thirdestand burnt and afterwards dipped in Vinegar, doth very speedily ourse those which are troubled with the head ach Being bound about the temples. The dust of Sheeps sleetes is very medicinable for the coring of all diseases in the genical parties for the dust of Sheeps sheeps wood, doth head all passions in Catelo. The Greciant Plaiser (called force). The dust of Sheeps wood, doth head all passions in Catelo. The Greciant Plaiser (called force). The Enneapharmacum): conditted of nine feveral things, and among the rest of unwalked wool. The filth which sticketh to the Sheeps wool and groweth thereunto, from which the thing which the first which the chief made, hath the force of digestion like unto Butter, and allow the short of concoction.

In a certain medicine of Andropathon, for the enting of the diffeale of the fifther parts, we washed wool is added to the restriction to the action for which faith for which she wool dots and come greate in the same quantity. Some do also for which she wool we the marrow of a young all, and applying the action of the same action. and apply in the aforesaid mariner; but this and affect wool is termed of the Correlant, Author and therefore being by divers Authors set down diversly concerning the making and virtue there-

of I have thought good to let down the trueltand excellentel way to make the fame (as Dieleof, I have thought good to the trust and excenence way to make the lame (as Diefcorides) whom in this is suppose best to follow, reporteth; First to take new shorn wool which is
very soft, and not trummed with sope-weed, and wash it with not water, then to presse all the filth forth of the fante, and calt it into a Cauldron which hath a broad lip, and afterwards to pour the water in, and to fire it up and down with a certain infrument with fuch great force as it may foam again, of with a wooden rod fill greatly to than and trouble it, to that the flithy froath or found agant) with Sea water, and the far may mate largely be gathered to getther afterwards to fortinkle it over with Sea water, and the far may more largely be garneted together, are wards to aprimate to ver with oca water, and the rat semanthy whileh did livim upon the root be gathered together in an earthen veffel, to powr the water into the Cauldron: then must the froath be powred again into the Sea water; and lastly taken out against this is so often the be done, that the fat being consumed, there will not any froath be Renout agains arms is so oriented be done, that the rat being confumed, there will not any froath be jet remainling the Aefpus their Being gathered together, is to be mollifyed with mens hands, and if there be any fifth therein, it must out of hand be taken away, and all the water by little and little excluded, and being fresh poured ins less to be mingled with ones hands, until the Aefpus being touched with the tongue of any one, may lightly bind it, but not savour either harp or eartly, and the fat may feem very white, and then let it be held in an earthful will but let there be great the about a savour and the latter be great the savour and the savour all the savour and and the late may be done in the Hellin. But there are fome which he another manner of way to make the fame, which is this, to cleanfe the fleeces, and wash away all filth, and prefie it forth of the fame, and boyl them in water over a foft fire in a brazen vellel, then to wash the fat which swimmeth on the top being gathered together with water, and being strained in another placter which may have forme fine water in it'to lide or overcast it with a limien cloth, and lay it forth in the fun until it be very white and thick enough.

Some allo do use another way, as this, to wash the fat being strained with cold water, and to rub it with their hands; not much otherwise then women do a sear-cloth, for by that means it is made

There is yet another kinde of way to make Arffred, described by Aeim in these words, Take (such he) the greatic Wool which groweth in the Moulder pits of Sheep, and wash them in hot water, being thick and foft, and fqueeze all the filth forth of the fame, the walking whereof you water, being wellel of a large mouth or brim, caffing afterwards hot water in the fame, then take the water in a cup, or in fome other fuch like inftrument, and pour it in and out, holding it up very high until there could a froath upon it then forlinkle ic over with Sea water, if you shall get any, (if not, with one other cold water, and fuffer it to frand fill; when it shall wax cold take that which shall show of the rop away with a sadde, and cast it into any other vestel, afterwards having put a little cold water in it, filt it up and down with your hands; then having poured out that water, put new consider in it, and repeat again the fame thing all together; which we have now taught, until the Adjuste made white and far, containing no impure or filthy thing in it at all, then dry it in the fun, being hid for fome certain days in an earthen veiled and keep it. But all these things are to be done when the Sun is very hot; for by that means it will be more effectual and whiter, and not

There are moreover some which gather it after this manner. They put new shorn wool which is very fikely and greasse in a vessel which hath hot water in it, and burn the water that it may fomewhat wax hot, afterwards they cool it, and that which fwimmeth above in the manner of fac. they found toff with their hands, and put it away in a veffel of Tin, and so do fill the veffet it suffer in water, and put it in the Sun covered with a thin linner cloth, and then we mill significant it again, and put up the Aeffpan, for it hath firength mollifying and releating with some tharpness, but it is counterfeited with war, sewet, and Rozen, and it is straight ways perceived, and forestiment as the true seffors referveth the stent of the unwashed wool, and being rubbed with any ones hands is made like unto Cerufe, or White lead.

Eventhe filth and sweat of freep, cleaving to their wool, hath great and manifold use in the world, and above all other that is most commended which is bred upon the Athenian or Greaten Sheep, which is made many ways, and especially this way; First they take off the wool from those places where it groweth, with all the fewet or filth there gathered together, and to put them in a brazen vessel over a gentle fire where they boyl out the sweat, and so take of that which swimmeth at the top, and put it into an earthen velfel feething again the first matter, which fat is washed together in cold water, fo dryed in a linnen cloth is scorched in the Sun until it become white and transparent, and so it is out in a box of Tin. It may be proved by this, If it swell like the ayour of sweat, and being rubbed in a wet hand do not melt, but wax white like White lead, this is most profitable against all inflamation of the eyes, and knots in cheeks, or hardness of skin

Of this Achipm or unwashed Wool the Grecians make great account, and for the variety of dreffing or preparing it, they call it diverily, formetime the call it Oespon Pharmateon, sometime Oesware the Hypotheside, or Keroten, sometime Oespon Hugon, and such like. Of it they make Haisters to allwage the Hypothesidial inflamations and ventosity in the sides. Some tile despon for Oespon; but ignoranty, and without reason, it is better to let it alone, but in the collection hereof it must be taken from the found and not from the feabby Sheep But when we cannot come by the true Oeffpm, then in freed therease and not from the feabby Sheep But when we cannot come by the true Oeffpm, then in freed thereof we may take that which the Apothecaries and Ointment-makers do ordain; namely, Meishi une. 4. Gardament une. 2. Hijopi berb. une. 2. with the unwashed Wool taken from the hands or flanks of a Sheep. Myreplus wied this Oefspus against all Gowts and aches in the legs or

articles, and hardness of the splean, Galen callethit Justane, and prescribeth the use of it in this fort; Make (faith be) a Plaister of Ochpin or Justane in this fort, Take Wax, fresh grease, Sommens, fort; Make (faith be) a Plaister of Octops of Justana in this fort, Lake year, tresh greafe, Sammage, old Oyl, one ounce of each, of Eenny-greek six ounces, then see the or boyl your oyl with the Justana, and Fenny-greek very carefully, until it equal, the oyl, and be well incorporated together and then again let it to the fire, with the prescription aforesaid; and also be teacheth how to make this Justana, for (sith he) take unwashed Wool, and lay, it deep in, sair water until it be very soft, that is by the space of six days, and the seventh day take it and the water together, that seethe well, taking of the sat which, artical at the top; and put it up as is aforesaid; thee

Dioscorides.

Marcellus.

things faith Galen.

The use of this by reason it is very hot, is to display Ulcers and tymors in wounds, especially in the secrets and seat, being mixed with Melilot and Butter, and it; hath the same, vertue against the secrets and seat, being mixed with Barly meal and rust of irons, equally mixed together, is running forcs. The same also with Barly meal and rust of irons, equally mixed together, is running fores. The same and with Daily 1958 and the from 1959, equally allowed together, is profitable against all swelling tumors, Carbuncles, Tetters, Serpigoes, and such like, it eatest a way all proud flesh in the brims of Ulcers, reducing the same to a natural habit and equality, also filling up the fore and healing it, and the same vertue is by Disporter attributed to Wool burgt, also in bruises upon the head when the skin is not broken, a Poultes, made, hereof, is faid by Galegio also in bruises upon the head when the skin is not proken, a Pouters, made, hereoft, is said by Gologio have excellent force and vertue. The same mingled with Roses, and the oar of brasse (called Nil) have excellent force and vertue. The same mingled with Roses, and the oar of brasse (called Nil) have excellent force and being received with Myyrth steeped in two cups of wine, it encreases by procureth sleep, and also is very profitable against the Falling-Siokness. And being mixed with Corfick Hony, it taketh away the spots in the face, because it is most sharp and subtile, whereum force add Butter; but if they be whealed and filled with matter, then prick and open them with a some add Butter; but if they be whealed and filled with matter, then prick and open them with a needle and rub them over with a dogs gall or a Galfs gall mingled with the faid Oelppus, also being in necdic and rub them over with oyl, it cureth the Megring, and furthermoxe it is used against all forencisof the eyes, and feabs in their corners, or upon the eye-lids, being fod in a new shell: and the same vertue is attributed to the smoke or foot thereof, if the eye-brows or eye-lids be anointed therewith, mixed with Myrrh and warmed, it is thought that it will reflore the hair that is wanting and fallenoff; but Marcellus prescribeth it in this manner, You muit rake Ochpus or sweat of Sheep from under the wool of their shoulders, and adding unto it a like quantity of Myrrh, beat them together in a morter, and with a warm cloth anoint the bare places.

er, and with a warm close the eyes, then you must anoint them first with Goose grease, and the bloud of a Mallard, and afterward with the fweat, of a Sheep, and the fame cureth all Hiers in the mouth, ears, and genitals, with Goose-greafe. This is also mixed with a Sear-cloth, and laid against the Phthisis (as Actim writeth) with a moist cloth against the Plurisse, also a Plaister made hereof with Goose grease, Butter, Allum, and the brain of a Goose, is very profitable against the pains in the reins, and all other infirmities, of the back, and for the fame, cause it is applyed to women, for it provoketh their monthly courfes, and also causeth an easie deliverance in childen hirth, it health the Ulcers in the fecret and privy parts of men and women, and all inflamation in the feat, especially the ulcers in the lecter and privy parts of men and women, and an innamation in the leaf, epecially being mixed with butter, Goofe greafe, and Melilot: and some add thereunto the oar of Brasle and Roses. If there be a Carbuncle in the privy parts, take this Oespew with Hony and the frost of lead, also white lead, womens milk, and this Sheeps sewet, cureth the Gowt, at the least marvailously, asswered the pain thereof, and some Physicians for this evil take Grease, Goosegrese, and the fat of Buls, added to Ocigem, also unwashed wool with the gall of a Bull laid to a womans and the fat of Buls, added to Uelymu, also unwashed woos with the gall of a Bull laid to a womans secrets, helpeth her monthly purgation, and Olimpias added thereunto Nitre. The dung which cleavest to Sheeps tails made into small bals, and so dryed, afterward beat into powder and rubbed upon the teeth, although they be loose, falling out, or overgrown with fieth, yet Play saith, they will be recovered by that fricassing. If he which is sick of a Dropsie drink this sweet or Oesprus in wine with Myrrh of the quantity of a Hasel nut, Goose grease, and Mirtle oyl, it will give him great eafe, and the same virtue is ascribed to the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is and hat been the same virtue is a series of the sweet of an Ewes udder, which is a series of the sweet of an Ewes udder, which is a sweet of a series of the sweet of the s

faid of all the former Oefpw.

The medicines of the Ram.

the Even as the skins of other Sheeps newly plucked from their backs and applyed warm, do take away the ach, (welling, and pains of ftripes and blowes from bodies, fo also have the skins of Rams, the same property. Arnoldus commendeth a plaister made of a Rams skin for burtining and falling down of the guts, and this is found ready prepared in many Apothecaries thops, and the happy fuccess thereof is much commended by Absim. If a man take the stones of afighting cock, and anoint them with Goofe greafe, and so wear them in a piece of a Rams skin, it is certain that it will cohibite and reftrain the rage of venereal luft, and a woman wearing about her the right loce of a dunghil cock in a Rams skin, thall not fuffer abortment. The washed seece of a Ram we in cold Oyl, putryfieth the inflamation of the fecrets; and likewise the black wool of a Ram wet in water, and then in oyl, and to put to the fick places, keepeth the fundament from al ling, and also asswageth the pain. Also the wool of a fighting Ram taken from betwint his horps, and perfumed into a smoke, easeth the pain, and some take the powder thereof in Vinegar for that Malady. They say that Law and Sale cure the bitings of mad Dogs, and also Textian and Quireless. tan Agues, with the menstruous purgation taken in a piece of Rams wool, and included in a bracelet of filver. Also they write that a woman shall have an easie travail if she wear in the wool of a Rim.

feed of wilde Cucumber about her foins, not knowing thereot, fo as it be prefently after the delivery cast out of doors. Also Marce's faith, that if one take the wool from a Rams fore-head, and burn in the cover of a new pot, and afterward beat it to powder in a morter, and so put it into Vinegar, and therewichal the forehead being anointed it eafeth the head ach. Allo the dust of Rams gar, and the the date of the pain in the yard. The matter of the Liver fod, hath the fame operation; and Vextes writeth, that if the wool be taken from the head, ribs, and cods, and alfo worn by him that hath a Tertian Ague, it perfectly cureth him, and if a mans fingers ends and toes be tyed with the unwashed wool of a Ram, it will stanch the bleeding at any part, especially the Noie. Allo if you burn the greafie wool of a very fat Ram, and in water wash the same, it will help all evils in the yard of man, if it be rubbed therewithal,

The broath of the rump of a Ram is commended against blisters. The flesh of a Ram being burnt and anointed upon the body of any leaprous person, or any whose body is troubled with Ring-Avicentis. worms or itches, is very effectual to cure them. The same force hath it against the bites of Scorpions, and ftingings of Serpents, and Algerarat: it also being taken in wine, is good for the bitings of ons, and the description of a Sheep or Weather hath the fame in it, ma dogs, and curech the fuffocation of the womb, and all other difeafes incident unto the fecret parts, and also helpeth places in the body being burnt by fire. The fat of a Ram being mingled with red Arfenick and anointed upon any scall or scab, the same being afterward pared or scraped, doth perfectly heal it. It doth also being mixed with Allum, help those which are troubled with Kibes or

Chilipanes in their facts.

The fewer of a Ram mingled with the powder of a pumice stone and salt, of each a like quantity, Sexum. is said to heal fellons and instamations in the body. The Lungs of small Cattle, but especially of a Ram doth reflore chaps or scars in the body to their right colour. The same vertue hath the fac of a Run being mingled with Nitre. The gall of a Ram mingled with his own fewer, is very good Marcellus.

and profitable for those to use who are troubled with the Gowt or swelling in the joynts. The horn of a Ram being burned, and the dust of the same mixed with oyl, and so pounded together, being often anointed upon a shaven head, doth cause the hair to frise and curl. A comb being made of often anointed upon a mayen nead, norm came and are to trine and curr. A comb being made of the left horn of a Ram, and combed upon the head, doth take away all pain upon the left part thereof if likewife there be pain in the right fide of the head, the right horn of a Ram doth cure it. For this curing of the loffe of ones with pringing from the imperfection of the brain, take the lead of a Ram never given to venery, being chopped off at one blow, the horns being only taken away, and feethe it whole with the skin and the wool in water, then having opened it, take out the brain and the wool in water, then having opened it, take out the brains and add. unto them these kinds of spices, Cinamon, Ginger, Mace, and Cloves, of each brains and a unto them these kinds of spices, Unamon, Uninger, Mace, and Cloves, of each one half in ounce: these, being beaten to powder, mingle them with the brains in an earthen platter diligently tempering of them by a burning cole, not very big, for sear of burning, which might easily be done, but there must great care be had that it be not too much dryed, but that it might be so boyled that it be no more dryed then a Cals brains being prepared for

It shall be sufficiently, boyled when you shall well mingle them at the fire, then keep it hid, and for three days give it dayly to the fick person fasting, so that he may abstain from meat and drink two hours, after. It may be taken in bread, or in an Bgge, or in what foever the fick party hath a defreunto; but there must be regard that he be not in a clear place, and that he use this forty days

there are those which are holpen in a short space, some in fix or eight weeks by this Medicine Marcellus. being received. But it is convenient that it be required for three moneths, and then it will have the more power therein. The Lungs of a Ram while they are not applyed unto wounds wherein the fesh doth too much increase, doth both represend make it equal. The Lungs of small Carele, but

pain, nowith flanding the expecting ach or pricking thereof. One drop of the liquor which is boyled out of a Rams lungs put upon the ingalt nails upon the hand, doth quite expel them. The like operation nath it to expel them, and in the privy members of man or woman; as also expel Warts in any place of the liquor which is the privy members of man or woman; as also expel Warts

or than unroasted, doth heal all pains in the privy members of man or woman; as allo experiwants in any place of the body. The juyce of the Lungs of a Ram while they are roasted upon a Gridiron Seximon place of the Lungs of a Ram while they are roasted upon a Gridiron Seximon place of the hair or privy parts of any man.

The inquor which distilleth from the Lungs of, a Ram being boyled, doth heal Tertian Agues, and the distalleth from the Lungs of a Lamb or Ram being burned; and the dust thereof pringled with Oyl, or being applyed raw, do heat the foreness of Kibes, and are accounted very profitable to be bound upon Ulcers. The Lungs of a Ram being pulled forth and bound hot unto the head of any one that is frenzie, will presently help him. Against the pession bound hot unto the head of any one that is frenzie, will prefently help him. Against the pestilent disacofsheep, take the Belly of a Ram and boylit in wine; then being mixed with water; give le to the Sheep to drink, and it will bring present remedy.

Pliny.

506

The gall of a Ram is very good for the healing of those which are troubled with any pains in The gall of a Ram is very good for the healing or those which are troubled with any pains in the ears, coming by the casualty of cold. The gall of a Ram mingled with his own sewer, doth ease those which are toubled with the Gowt. The gall of a Weather mingled with the wool and placed upon the navel of young children, doth make them loose in their bellies. The story of an old Ram being beaten in half a penny weight of water, or in three quarters of a pint of Asses of an old Ram being beaten in half a penny weight of water, or in three quarters of a pint of Asses milk, are reported to be very profitable for those which are troubled with the falling sickness. The gar and rathioned in the flesh. The same being applied in the like manner, cureth St. daibnite fire, and heafeth burned places.

Sext W.

e, and nearest which groweth between the thighs of a Ram being mingled with Murch The nich or tweat which groweth between the thighs of a Rain being iningled with Myrth and the Herb called Hart-wort, and drunk of each an equal part, is accounted a very excellent remedy for those which are troubled with the Kings evil. But Pliny commendeth the fifth of Rams ears mingled with Myrth, to be a more effectual and speedy remedy against the laid difeafe.

The medicines of the Lamb.

Actius.

The best remedy for bitings of Serpents is this, presently after the wound to apply some little The best remedy for bitings of Serpents is this, presently after the wound to apply some little creatures to the same, being cut in shall pieces, and laid hot unto it, as Cocks. Goats, Lamb, and young Pigs; for they expel the point and much ease the pains thereoff. An ounce of Lumbs bloud being fresh before that it doth congeal mixed with Vinegar, and drunk for three dayes together, is an excellent remedy against the vomiting or spitting of bloud. The likesore in that the bloud of a Kid. The bloud of a Lamb in ingled with wine; doth heal those which are it hath the bloud of a Kid. The bloud of a Lamb in ingled with wine; doth heal those which are it not the Follieg six of a said those which have the foll evil. For the conception of a Woman, take the yard and gall of a Buck, a Kid, and a Hare, with the bloud and sewer of a Lamb, and the marrow of a Hair, and mix them all together with Slard and Oyl of Roses, and after her purgation; set them be laid under her, and this without all doubt will make her an after her purgation; set them be laid under her, and this without all doubt will make her an after her purgation; set them be laid under her, and this without all doubt will make her an

Pliny.

The skins of Serpentes being une included with water in a bath, and mingled with line and lambs fewer, doth heal the disease called St. Missing five. The marrow of a Limb melted by the fire, with the Oyl of Nuts and white sugar, distinct upon a clean dish or platter, and to drink, doth dissolve the stone in the bladder, and is very prostable for any that plates, and is given dissolve the stone in the bladder, and is very prostable for any that plates being dawbed or anoing all pains or griefes of the yard, bladder or reins. The skin of a Lamb being dawbed or anoing ted with liquid pitch, and applyed hot unto the belly of any one that is troubled with executa-ons of the bowels or of the Bloudy flux, will very speedily cure him, if he have any lense or stelling of cold in him.

Hippocrates.

If a Virgins mentrual fluxes come not forth at the due time, and her belly is moved, it is convenient eo apply Lambs skins being hor unto her belly, and they will in thort large sule them to come forth. A garment made of Lambs skins is accounted very good for the corroborating and to come forth. A garment made of Lambs skins is accounted very good for the corrobbiating and firengthning of young men. The skins of Lambs are more hot then Kids skins, and are more hot then Kids in the right for the relations. The little bone which is in the right for officer applied thereunto. The duft of Lambs bones is very much and rightly used for Ulters with have no chops, or stars in them. The dust of small Carties dung being mingled with Nice, but especially of Lambs, hath in them great force to held Carties dung being mingled with Nice, but especially of Lambs, hath in them great force to held Carties dung being duffor Lambs bones, is very much commended for the healing and making of green wounds sound and ford, which thing by the Saracins is much verified in regard that at all times they go to war, they never forget to use of the same along with them. the same along with them.

Marcellus. Pluny.

The Lungs of Lambedo very effectivally cure those whose feet are wring or public by their shoo-soles. The Lungs of Lambson Rums being burned, and the dill thereof mingled with Oylis very positivally for the curing of kibes or ulcers, being applyed the rediffer. It hath the time struct

Marcellus.

being raw and bound upon the fore? The function of a Lamb is of very great force against all other evil medicines. The function of a Lamb is of very great force against all thids of policy in found to a Kid, a Lamb, and a hind-calfare conveniently taken against all thids of policy in the mine of a Hare, a Kid, or a Lamb taken in wing to the weight of a draw's very effectual against the force of a Harb draw in wing to the weight of a draw's very effectual against the force of the bittes or strokes of all Sea-sishes. The funnet of a Lamb draw in was a left of the draw in was a left of the draw in was a left of the draw of the bittes of a Shrew. The rumet of a Lamb draw in was a left of the default shall happen by so young children who are voked with thick and concern the bittes. A Lambs runnet his being raw and bound upon the fore 10 curded milk, it will be foon remedyed by a Lambe winder given in Vinegar. A Lambs runner has or powred into water; doth speedity to little bleeding of the note, when nothing elle en lay it The gall of small Cattle, but especially of a hastilb being mixed with thony; are thought to be very medicinable for the curing of the Falling fickness.

The places which are infected by Cankers, being anointed over with the gall of a Lamb are very

the meanings of the Sheep.

de la company de compared to the compared to the control of the cont which the interest districted the district of the control of the c

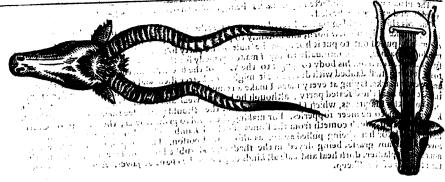

There is in Crete neer the Mountain Ide; a kinde of Sheep called by the Shepherds Strepficers, Bellonius. which is not different from the vulgar sheep, except only in the horse, for they bend not like other, but dand straight and upright like the Othern, and besides are circled about with certain round specialists. This liveth in flocks, and we have here besides the figure of the besides are circled about with certain round specialists. beaff, expressed a double form of their horns, and fore part of their head, the figure of a Harpe being fastned to one of them as it was presently drawn. The description whereof was taken by Doctor

Co of England, in these words following.

The horns of this Strepsiceros are so lively expressed by Plien, and so fittly fitted to bear Harps, that they feem not to aske any further narration of words. I will therefore only add this, they are hollow within, and long, about two Roman feet and three palms if you measure them, as they are Artigot, but if you take their fantling and length as they crook a little, then are they about three loot long, they are in breadth where they joyn to the head, three Roman fingers and a half, and their whole compais in that place is about two Reman paims and a haif. In the top they are fmooth and black, but at the root they are more dusky and rugged, growing leffer and leffer to a therp point. They with the dryed face did weigh feven pounds and three ounces, and the face which remains the face of the face which the dryed face did weigh feven pounds and three to the face which the dryed face did weigh feven pounds and three ounces, and the face which remaineth is joyned to the horne, and likewise the hair of the mook and face. It is said that this Beaft is a great a synthesis and the said that this beaft

is as great as a Hart, having a red hair like a Hart. But whether his nostrils were for also I could not conjecture, by reason that the age and long tife of the piece had defaced the note which was dryed up, and also the hair was worn away, to as it was bald, but by that which was most apparent unto it, I rather inclined that it resembled a Hart, from

Pliny.

The History of Eour-footed Beafts.

hence it was that the drawer made the notirils lefts then might answer the proportion of the face, and that which is seen betwitt the horns it is a piece of the neck, by which relation I cannot believe that the Cretian or Idean Sheep is a Strepficeros, because the horns thereof do not bendat all, although it answereth not the name, but the true horns of the Strepfceros do as I have faid resemble the angient fashion of harps, among our fore-fathers, especially the handle being taken away, and the face of the beaft placed in itead thereof.

Unto this I may add another horn, which is to be feen in the Caftle of the L. William Wembere Count of Cimbria, being black, hollow, and of the length of ones arme; and as thick as a great fuffe, and it was faid, that the beaft beareth two of them, which are to be feen among the rare monuments of Ferdinandus the Emperor.

"He name of this Beaft is by the Grecians called Sciuros, and it was given them from the fathion and proportion of their tail, which covereth almost the whole body, for that which is lously said of the Seiapedes to have feet that cover their whole body, is more truly wished of squirrels tail, for in the day time being out of hernelt, the hideth her felf there under both from

The first Author that ever wrote of this Beast was Oppianus, who lived in the days of Ameliana Cefar, and the Latins have no proper or native name for it, but borrow from the Graduit although fome of the latter writers call it Pirolus, and Spinras, Tthink they would fay Sciurus; for fo it is will garly termed in Latin: fome also call it Sculuru a currendo, because of his nimble running upon boughs. But all the Nations of the world derive their feveral denominations from the Greciant, to the English Squirrel from Science is not far fetched; the French words Escurieu; and Escurieu whom the Grant bound is not far fetched; whom the Germans borrow their words Eychorn, or Eichen, or Eich horn, or Eich beimlin, that a Westell of the tree and De Full of the tree, and Das Eychorn.

The stellans call it Schirivolo, and the Vinetians (as Masfarim tellifieth) Schiriati ; the Spaniards Harda, and Elguilo, and some do interpret Coma dreia for a Squirrel; the Ilyrians, Weweeka, and some of the Polonians, Wije Wijerka, and so they turn the Mouse Varius, as we have said else where in that flory, and some of the Germans call it Werck, and Veeb, and Fech.

Now Albertus and Agricola lay, that there is no difference betwixt the Mouse Varius and the Squirrel, but only in the Region which altereth the colour, and therefore we have expressed the fame figure thereof, remitting the Reader to that which is faid in that History, for this (fay they) in Germany is red after it be a year old, but before that time it is blackish, that is till it be a year old: In Polonia it is of a red-ash colour, or branded grysell, in Russia of an ordinary ash colour, and for the quantity, food, and manner, or natural inclination, it hath the same in all parts with the moufe Varius.

Varinus and Helychius say, that the Grecians call this beast also Campsiouros, and Hippouros, and some call the Cappadocian Mouse Neeris a Squirrel; the Jewes at this day call a Squirrel Coach, for it is apnatent that in antient time till they came into these parts of the world into Grecia and Europe, they never knew or faw this beaft. And this shall suffice to have faid of the name.

A Squirrel is greater in compass then a Weasel, but a Weasel is longer then a Squirrel, the back parts and all the body is red, except the belly which is white. In Helvetia they are black and branded, and they are hunted in the Autumn at the fall of the leaf, when the trees grow naked, for they run and leap from bough to bough in a most admirable and agile manner, and when the leaves are on, they cannot be so well discerned. They are of three colours, in the first age black, in the second of a rusty Iron colour, and last of all when they be stricken in age, they are full of white hoar hairs. Their teeth are like the teeth of Mice, having the two under teeth very long and fharp, their tail is always as big as their body, and it lyeth continually upon their back, when they fleed or fit still; It feemeth to be given them for a covering as we have faid already. The maw-gut differeth from all other, for it is Cocoum, that is, as I take it without a paffage out of it into any other part then the other guts, or like a mans bladder; and it is as great as their ventricle, which in diffection hath been found full stuft with excrements. The genital is like a bone, as Vefalius writeth.

They use their foreseet in stead of hands, for they sit upon their buttocks, and move their meat to their mouth with them, in this point resembling every little vulgar Mouse, yet being put to the mouth, they hold it in their teeth. They will eat Nuts and Almonds very greedily, and also Apples, Buckmasts, Acorns, and sometimes herbs, especially Lettice, and all other sweet fruits. Their feet are cloven like Mice, and their hinder parts very fleshy to sit upon. In the summer time they build them nells, (which in our Countrey are called Drayes) in the tops of the trees, very artificially of flickes and moffe, and fuch other things as woods do afford them.

The mouth of their nest is variable, sometimes at the sides, and sometimes at the top. but most commonly it is thut against the winde, and therefore I think that the maketh many passages, stopping and opening them as the winde turneth. In Summer time they gather together aboundance of fruits and Nuts for winter, even so much as their little Dray will hold and contain, which they carry in their mouths, and they lodge many times two together, a maje and female (as I suppose.) They fleep a great part of the Winter like the Alpine Mouse, and very foundly, for I have seen when no noile of hunters could awake them with al their cries, beating their news on the outlide, and thooting boltsand arrowes thorough it, until it were pulled afunder, wherein many times they are found killed before they be awaked.

They are of incredible agility and motion, never standing still, as it appeareth by them which are tamed. When they leap from tree to tree, they use their tail in stead of wings, which is most apparent, because many times they leap a great distance and are supported without finking to mane appearance.

And again I have seen them leap from the top of very high trees down to the ground in such an ordinary pace as Birds flie from trees to light on the earth, and receive no harm at all : for when they are hunted, men must go to it with multitude, for many men cannot take one with bowes and bolts with Dogs, and except they ftart and rouze them in little and small stender woods, such as a man may shake with his hands; they are seldom taken.

Bowes are requisite to remove them when they rest in the twists of trees, for they will not be much terrified with all the hollowing, except now and then they be struck by one means or other. Well do they know what harbour a high Oak is unto them, and how secure they can lodge therein from Men and Dogs, therefore seeing it were too troublesome to climb every tree, they must supply that business or labor with bowes and bolts, that when the Squirrel resteth, presently she may feel the blow of a cunning Archer, he need not fear doing her much harm, except he hit her on the head, for by reason of a strong back-bone and seshy parts, she will abide as great a stroak as a Dog; yea, Thave feen one removed from a bough with a fhot to the ground.

If they be driven to the ground from the trees to creep into hedges, it is a token of their wearines, for such is the stately minde of this little Beast, that while her limbs and strength lasteth, the tarryeth and faveth her felf in the tops of sall trees, then being descended, she falleth into the mouth of every Cur, and this is the use of Dogs in their hunting.

The admirable wit of this Beaft appeareth in her fwimmig or passing over the Waters, for when hunger or some convenient prey of meat constraineth her to passe over a river, the seeketh out some rinde or small bark of a Tree which she setteth upon the water , and then goeth into it,

and holding up her tail like a fail, letteth the winde drive her spithe other fide, and this is wit. and holding up her tan ince and, retection of Scandinavia, where this is ordinary among Squirels. by reason of many rivers, that otherwise they cannot passe over; also they carry meat in their mouth to prevent famine what soever befall them, and as Peacocks cover themselves with their taile in hot Summer from the rage of the Sun, as under a shadow, with the same disposition doth the Squirrel cover her body against heat and cold,

They grow exceeding tame and familiar to men if they be accustomed and taken when they are young, for they run up to mens shoulders, and they will oftentimes fit upon their hands, creepinto their pockets for Nuts, go out of doors, and return home again; but if they be taken alive, being old, when once they get loofe, they will never return home again, and therefore fuch may well he

called Semifere rather then Cicures.

They are very harmful, and will eat all minner of woollen garments, and if it were not for that discommodity, they were sweet-sportful beasts, and are very pleasant playfellowes in a house.

It is faid, that if once they tast of Garlick, they will never after, bite any thing, and this is preferi. bed by Cardan to tame them, their skins are exceeding warm, and well regarded by skinners, for their heat is very agreeable to the bodies of men, and therefore they are mixed also with the thins of Foxes. Their flesh is sweet, but not very wholesome, except the Squirrel were a black one. Itis tender and comparable to the flesh of Kids or Conies, and their tails are profitable to make

The medicines are the same for the most part which are before expressed in the Dormouse, saving that I may add that of Archigenes, who writeth, that the fat of a Squirrel warmed on a rubbing cloth, and so instilled into the ears, doth wonderfully cure the pains in the ears. And so I conclude this history of the Squirrel with the Epithets that Martial maketh of a Peacock, a Phoenix, and a Squirrel, in a comparison of a beautiful Virgin Eration.

> Cui comparatus indecens erat pavo, Inamabilis sciurus & frequens Phanix.

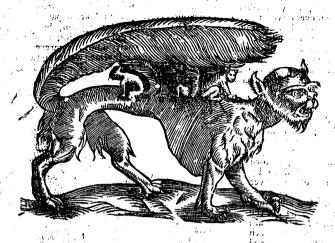

Of the Getulian Squirrel, described and figured by Doctor Cay.

"His Getulian or Barbarian Squirrel, is of mixt colour, as it were betwixt black and red, and from I the shoulders all alone to the tail by the sides, there are white and russet strakes or lines, which in a decent and seemly order stand in ranks or orders; and there be some of these Squirrels which have fuch lines of white and black, with correspondent lines in the tail, yet they cannot be feen except the tail be firetched out at length, by reason there is not much hair upon it. The belly feem eth to be like a blew colour upon s white ground. It is a little leffe, then the vulgar Squirrel, and hath nor any ears extant or flanding up as that, but close pressed to the skin round, and arising the in length by the upper face of the skin. The head is like the head of a Frog, and in other things is it is seen. things it is very like the vulgar Squirrel, for both the outward hape, the manner, and behaviour, the mean and means of life agree in both, and the elfo covereth her body like other Squirrels. This picture and description was taken by him fromtone of them alive, which a Marchant of Break brought out of Barbary.

They are very pleasant and tame, and is is very likely that it is a kinde of Egyptian or African Mouse, whereof there are three sorts described by Herosotus, the first called Bipeder, the second Zegeries, and the third, Echines, of which we have already spoken in the story of divers kinds of Mice, and therefore I will here end the discourse of this Beast. Of a Wilde Beaft in the New found World called SU.

idayo

There is a Region in the New-found World, called Gigantes, and the Inhabitants thereof are called Pantagones; now because their Country is cold, being far in the South, they clothe themselves with the skins of a Beast called in their own tongue dus for by reasonthat this Beast heeh for the most part neer the waters, therefore they call it by the name of Su, which fignifieth water. The true Image thereof as it was taken by Thereins, I have here inserted, for it is of a very water. The true image thereor as it was taken by Theveius, I have here inferted, for it is of a very deformed shape, and monstrous presence, a great raymer and untimable wisde Beast, When the Huntersthat desire hones in set upon her, she sheeth very swift, earlying her young ones upon her back, and covering them with her broad tail: now for some upon boy or Man dareth to approach net unto her, (because such what thereof, that in the pursuit she kinetical shae cometh near the lunters dig several pits or great holes in the earth, which they cover with bought, sicks, and earth, so weakly that if the Beast chance at any that to come upon it; she and her young ones sall down into the air sale are taken.

and carring to wearing unter title Dean chance at any trace to contempority, the and her young once fall down into the pit and are taken.

This cruek untaged in impatient, violent, ravetangs and bloudy beaft; perceiving that her natural fittength cannot deliver her from the wit and policy of men her hunters; (for being inclosed the can never get out again,) the Hunters being an hand to watch live downfall; and work her overthrow, first of all to save her young ones from saking and taming, the destroyeth them all with her own teeth; for there was never any of them saken alive; and when the feeth the Hunters come about own teeth; for there was never any of them taken alive; and when the jeeth the Hunters come about her, the toareth, cryeth, howleth, brayeth, and uttereth such a fearfull, noy forme; and terrible class mor, that the men which watch to kill her, are not given the just a first and the jest being the mated, because the service no resistance, they are proach, and with their darts and theart would her to death, and it is take off her skip, and they are the earth. And this is all that I findle tecorded of the most swage Beast.

| The proof the SUBUS, Example Warts Support

This Beach is called by Opplanus Soubes, and thereof the Latines called By Bollme in his interpretation of Opplanus, docto make it one heaft wanted Strepfiered, but because he expressed by his colour or least of living, cannot agree with the Strepfierer, for he saith only it is the same Beast which

But we know by the description of Opplants, that this Beast is of a red gold-colour, having two brong armed horns on the head, and liveth sometimes in the Sea, and Water, sometime on the land, of all kindes of Sheepi this is the world and nost harmful, ravening after life and blond; for it goeffs to the water, and the win summeth: when the silly simple sinkes see this glosious little in the wall and shundance, especially Shrimps, Lobbers, Mackarel, and Tenches, who follow him with singular delight on either side, both the right and the left, pressing who shall come nearest, to tourn and have

have the fullest fight of him; to they accompany him in ranks for love of his fo strange proportion. But this unkinde and ravening Beaft, despising their amity, society, and sellowship, maketh but a bait of his golden outside and colour, to draw unto him his convenient prey, and beguile the innocent fishes, for he snatcheth at the nearest, and devoureth them, tarrying no longer in the water cent mines, for the matthet at the hearts, and the feling their fellows devoured before there then his belly is filled, and yet these simple foolish fishes feeing their fellows devoured before their faces have not the power or wit to avoid this devourers fociety, but fill accompany him, and weary him out of the waters till he can eat no more, never hating him, or leaving him, but as men which delight to be hanged in filken halters, or flabbed with filver and golden bodkins, fo do the fifther by this golden-coloured-devouring-monfter. But fuch impious cruelty is not left unrevenged in nature. for as the gathereth the fifthes together to destroy them, so the Fifthermen watching that concourse, do entrap both it and them, rendering the same measure to the ravener, that it had done to his innocent companions. And thus much shall suffice for the Subm or Water-sheep.

of the SWINE in general.

The feveral names.

DEing to discourse of this beaft, although the kindes of, it be not many as is in others, yet because there are some things peculiar to the Bore, and therefore he deserveth a special story by himself, I will first of all deliver the common properties in a general Narration, and afterward descend to the special. For the names of this beaft, there are many in all languages, and fuch as belong to the feveral fex and age of every one. For as in Engwe call a young Swine a Pig. a Meaning Pig, a Sheat, a Yealk, and so forth; likewife a Hog, a Sow, a Barrow, a Libd-hog, a Libd-fow, a Splayed Sow, a Gelt Sow, a Bass, for the elder Swine, so in other Nations they observe fuch like titles. The Hebrews call a Bore Chasir, and a Sow Chase-rab, the Chaldees, Deut. 4. for Chafir translate Chafira; the Arabians, Kanifer ; the Perfians, Maran-buk ; the Septuagints, Hus; and S. Hierom, Sus; the Arabians alfoule Hagir, and Adambil, for a Hog, Achira, and Scrofa. The Grecians do also use Sus,

or Zus, Choires, and Suggres. The wilde Hog is called Kapron, from hence I conjecture is derived the Latine word Apex; the Italians do vulgarly call it Porce ; and the Florentines peculiarly Ciacco; and

also the Italians call a Sow with

Pig Scrofa, and Troiate, or Porco fattrice. The reason why that

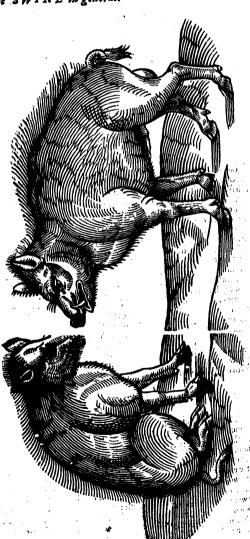

they call a Sow that is great with

Pig Trojata, or Trojaria is for the similitude with the Trojan Horse,

because as that in the belly thereof did include many armed men, so doth a Sow in her belly many young Pigs, which afterward come to the table and dishes of men. A Barrow hog is called Majalis in Latine, and the Italians, Perco castrato, and Lo Majale. The French call a Swine Porceau, a Sow

Sylvaticus.

Erythraus.

Traje Coche, a Bore Verrai, a. Rig Cachon Egyreics, and about Lyon, Cajun. The harrow Hog they call per-chafter. The Spaniards call Swine Puerce subje Germans, Sagapt Sur, Sur, of win, Schwin, a Sow they call Mri and Loop, a Bore Acher, which feemech to be desired from Act, a Barrow Hog Barrow a spayed Sow Gulla, a Pig & etc. and Schwife, and a fict of grant from the Moreous they call a Hog Hours, and thereoff they call a Dolphin Merhanch. The Morious call Swine Swine, and fire the Latins, Swine swine, and free common and most suffer searing of Swines is It there be any other, they are either devised or new made, or site derived from some of thele.

f thele. Concerning the Latine word we, Indorus decineth it from sub- because their heads tread under- The crims ... foot grass and grain, and indeed for this cause the Egyptians kept their Swine in the hills all the gy of the year long, till their feed time; for when their corn was fowen they drove tham over their new Greek and plowed lands, to tread in the grain, that the Fowls and Birds might not rootile or lettipe it forth again, and for this cause also they spared Swine from Sacrificing. But in mine opinion it is better derived from Hu, the Grack word . For the Catines Porcusin thought to be forel a licom Porcellus becance his look te stand their ched torth and to be readerly winding with the well to the third third ing up the white. That is, because it consects and wallowers, in the mire. Parenta or Parenta for a sow that hash had but one fancow, and sempla for a sow that hash had but one fancow, and sempla for a sow that hash had many. The Greening Living derived from Thein, which Dignifieth to kill to facrifice, for great, was the use observations this basil among the flyuing, as we half hew sates well in The anciens Greature did alforearm Swine, Sing, and when the Swine-herse did sall the Bautaranteir means, shey, cryed Sig, Sig. as in our Countries and when the Swine-herse did sall the Bautaranteir means, shey, cryed Sig, Sig. as in our Countries and when the Swine-herse did sall the Bautaranteir means, shey, cryed Sig, Sig. as in our Countries and when the Swine-herse did sall the Bautaranteir means. trey their feeders cry Trg. Tiel Chiros. Of Rheit feeding and purfing their young ones. And indeed A history of from Swine we finde that many men have allose greved names, as soin Suarius, and Tremelius Sciot the family of fa, whereupon lyeth this history, as he writted higher Ligings Nature, was Description and Tremelius Sciot. iet Quellor in his ablence for Mesed in the Light Light Light Mese, bestor, in great their was left Quellor in his ablence for Mesed in the Light Laborator in the commentation of the most to be made, and a fight to be offered when his Uncless thorough the Koman Souldiers to arms, told them, Sectionier before difficultiment, Souldiers to arms, told them, Sectionier before difficultiment, Souldiers to arms, told them, as a Sow doth her bigs higher her before them, as a Sow doth her bigs higher her her before a sould be performed accordingly, and so obtained a great pictory, for which her bigs higher her before, and so was always exernore, afterward called Society.

Marobins reliet the occasion of the name of the family of Sams formewhat otherwife, ver per-uing to this difference. A remellint, faith he was with his family and children, dwelling in a certain village, and his ferrants feeing a firay Saw some among them, the owner whereof they did not know, prefently they liew her, and brought her home. The neighbour that did owe the Sow called for witnesses, of the fact or cheft, and same with them to Kremellius, demanding his Sprees or Sow again. Tremellius having understood by one, of his fervants the deet, light it up in his Wives bed, and covering it over with the clothes, caused her to lie upon the Sows garkase, and therefore told his neighbour he though come in and take the Sarofs, and to had brough him where his wite lay, and sweet he had no other Sow of his the the the death of the poor man was deand twore he had no other Sow of his but that, thewing bimithe bed; and for the poor man was decived by a diffembling oath, for which cause (he saith) the name of Soiosa was given to that familly. There was one Pope Sergius, whose christen and first name was Of percha Hogs face, and Names of therefore he being elected Pope, changed his name into Serging, which culton of alteration of men taken names, as that was the beginning, fo it hath continued ever fince that time among all his fucces, fors. Likewife we read of Porcellus a Grammarian, of Porcellius, a Poet of Naples, who made a Chronicle of the Saine. tors. Likewile we read of Percellus a Grammarian, of Porcellius, a Poet of Naples, who made a Chronicle of the affairs of Frederick Duke of Meding, Porcellus, Suillus, Verres the Pressor of Sicilia, Syadia, Hyar, Hyagnie, Gryllus, Porciles, and many fuch other give sufficient settimony of the original of their names to be drawn from Swines, and not only meno, but people and places; as Hydre, Sudies, Christia, three names of the Portin Greece: Hydra, City of Locies, Hydremena, a City of Medine, Hydrampolis, a Lity of Received the Hydra, Whereby to all posterity it appeareth, Alex. ab Alex that they were Swineherds at the beginnings. Exist Hydrapor impent regina per, agros Hydre, Hydra City of Basita, and Plin callethathe tall people of Ethiop, which were eight cubits in height Subsec, and the like I might side of many places. Cities People Hountains. Plants cubits in height Sybote, and the like I might adde of many places, Cities, People, Fountains, Plants, Engins, and deviles, plentiful in many Authors to but I will not trouble the Reader any longer with that, which may be but thought to be unisceffary. Only, cannot contain my felf from the fiction of a Swines name and Testament, or last Will, for the mirth and wit thereof, as it is remembered in Caliu, and before in S. F. rom, and lastly by Alexander Brafficanus, and Geo. Fabritius, I, will express book in Latine and English in this place.

I have expressed this discourse for no other purpose but to shew the Reader what proper signal names have been or may be given to Swine, and so not to hold him any longer in this discours, I will proceed from the names to the natures of this Beaft. And first of all to begin with the com-The epithets of mon and vulgar epithets, which are as fo many fhort definitions as they are words as that of these, mon and variet process. A sure areas to many more and a series and process and many more areas of the late, a dirt-lover, clover-footed, beaftly, clamorous, Acron eater, rough, horrible, featful, flugglish, filthy, unclean, impatient, loud, glad of food, miry, far, wet, follower, moil, greedy, tender, and milk-fucker, according to the Poets fayings;

Latte mero puftum pigra mibi mairis alumnum, Ponat: & Ætole de sue dives edat.

do not breed.

Swine are in the most Countries of the world. Yet Ariffotte and Elian report, that there are none wherein Swine in India, and Arabia Scein: and moreover there is in the people of those countries such a detestation of them that they cannot endure to eat their flesh, which is not wrought in them by any instinct or opinion of Religion (as it is in the Jown) but rather by a natural inclination of the place and Region wherein they live, for it is said also, that if Swine be brought thither from my other place, they die within short space.

place and region wherein they lives for it is islutated; that it swine be brought thinds other place, they die within thort space.

Pliny affirment, that there are Boars among some of the Indians which have horne, and the live Pliny affirmed of the Estippings. The Swine of Stelly are accounted the best of all other for food in Brigainst they are lean, but in Burgand, or the neather Griman, they are fierte, strong, and very in Those which are carried into Hispanisia, are faid to grow to the stature of Mules, Now concerning the several parts of Swine, it is most certain that inwardly they do more resemble.

a mans body then an Ape, for as all writers do affirm, that outwardly the proportion of Ares come nearest to men, according to the Poets verle ?

Simia quam smilis curfifima bestia nobis.

So on the other fide a Swines Anatomy doth more lively express the inward members and feat of life, and therefore our predecessors did first of all diffect a Swine, and then a Man, for the Swine was an example or Introduction to the other stand in Swine they chuse a lean Hogy because that all the wessels and instrumental parts do better and more clearly appear to the sight then in a fat Hop. There is not according to Arifinles, much marrow in their bones, and their skin is all over rough and hairy. The anatomy and yet the hair not forthick as an Okes, yet moth longer and thiffer, franding up upon the ridge of and feveral the back; the colour of Swine is uncertain, and varieth not only after the divertity of the Count parts. trey, but in every Countrey it is divers in it felf, some are white, some branded, some sanded some red, some black, some byed, some none of these, and some all of these il yet in Garnety for the molt part red, and in France and Italy black. il

oft part red, and in France and Italy black. A party of the party of t fat and in the wane of the Moon it is less then any other brafts. Their eyes are hollow, and stand very deep in their heads, and therefore cannot by Art of man be taken out withduc danger of death and if one of them be at any time perished, it is a hazzard but the Swine dyeth. in 1911 11 11 11 11

Their eye-brows move more downward toward their nofes, and are again drawn up toward their temples, and their fore heavis very narrow, by which in specient time they judged or deemed a foolpr foolish unwife disposition, as by standing up of the lips about the thing teeth, betokeneth a contumelious and clamorous rayler, and thick lips, and a round mouth flanding forth the differlition of a Hog. ar annoid a

The flowe is long and Brong, and yet broad to raft up the earth for food, having on the tip wifeling griffle round, and more piked, at the top betwirt the mobile, switerewithal it first entereth the earth by digging. Upon oheir under thap there are teeth which grow out of their head, and the Boars have some which the demales have not il For even as the Elephant hath two teeth growing downward, to hath the Boantwo growing upward. The male as we have faid, hath more than the female, and neigher of boohido lofe or thange raem by any confect nature. As the Horfe hath his mane, fo hath a Swine certain briftles on his neck (called therefore by the Grecians Lopbia) this neck is broad and shick, and in fit tyeth the linength be the beatt, and therefore it is observed by the Phyfingnomers, that a man with furth a recklistan angry fool. 200 2000 . **ประก**อ **หม**ับ (อ. ไม่) แคนคิด

The collop next to the neck called vulgarly Callajum, ought to be broad and fiffer It is faid of fore Hans, that they have their gall in obeir edrs, and indeed in the ears of Swine there is found a corrthickness thereof, comparable to the humor of the Spleen, in The wentrible so large to reteive much ment and to concoct it perfectly, we call it walkerly the Block and there is to but lew mooth observed and in the liver pares which are very great; there is a certain third thing white like a flore. The temales have swelve unders or large under the belty but never less then real litthey want of twelve; and the Boars have their stones on their feat behinds them joyiled expecter, which being taken off, are called by the Latines; Polimentalism of the day of the control of the c

The food of

Swine.

It is most certain that Swine are of a hot temperament, and for that cause it cometh to pus that they do not loofe their Winter hair, for by reason of the fat neer to their skin, there is abundance of heat which keepeth falt the roots of the hair. Their food therefore and nouabundance of neat which keepeth take the for that which is fo strong in the nouriture of the hair mult needs be of correspondent power in other parts. Some have thought that Swine care not for grafs or herbs, but only roots, and therefore hath a peculiar fnout to attain them, but I finde by experience, that they will eat grass above the earth, as well as roots beneath, and they love to feed in herds together. They love above measure Acorns, and yet being given to them alone they are huttful, and bring no less damage to them then to Sheep, (though not fo often) especally to Sows that be with Pig. The best time for gathering of Acorns is in N.vember. and it is a work for women and children. The Woods of Italy are so full of Acorns, that they nourish abundance of Swine, and that therewith are fed the greatest part of the Reman

The History of Four-footed Beasts.

Nigidius.

Pliny.

People.

They delight also in Buck-mast, and that meat maketh the Swines flesh light, easie of digestion, and apt for the stomach: In some Countries Haws have the same vertue to fat Hogs, that is in Acorns, for they make them waighty, straight, neat, and sweet. The next unto this Holm-bernes do fat Hogs, faving that they procure loofeness, except they be eaten by little and little. Thereisa tree which hath such bitter fruit (called Halipbloom) whereof no beast will taste, bereof Hogs will tast, but in extream famin and hunger, when they are without all other food

The fruit or Apples of Palm-trees (especially such as grow in salt grounds near the Sea sides, as in Cyrene of Africa, and Judea, and not in Egypt, Cyprus, Syria, Helvetia, and Affria) do fatten and iced Hogs: And indeed there is scarte any food whereof they do not eat, as also no place wherein they pick not out some living, both in Mountains and Fens, and plain fields, but best of all near waters.

wherein by the banks fides they gather many fweet and nourifhable morfels.

Places of their

There are no better abiding places for Hogs then are the Woods, wherein abound either Oake. Beeches, Cork-trees, Holm, wilde Olives, Tamarisk, Hasels, Apples, or Crab-trees, white Thorn the Greek Carobs, Pine-trees, Corn-trees, Lote-trees, Prune-trees, Shrubs, Haws, or wilde Pears or Medlers, and fuch like; for these fruits grow ripe successively one after the other, for there is no time of the year wherein some of them are not to be gathered foft and nourishable, whereby the herds of Swine may be maintained.

But if at any time this food cease, and not to be found, then must there be someother are vision out of the earth, such as is corn, or grains, and turn your Hogs to moilt places, where they may pick up worms, and fuck up fat fenny water, which thing is above all other things grateful to this beaft; for which cause it pleased the holy Ghost in Scripture, to compare the pleasure that beastly men take in Binning, to the wallowing of Swine in the mire. The De (faith S. Peter) is returned to bis wanit, and the Som that was walked to wallow in the mire. For this cause also you must suffer them to dig in the water, and to eat, Canes and wilde Bulrushes, likewise the roots and tops of Water-creffes; and you must provide to lay up for them in water Acous. and not spare corn to give it them by hand, as Beans, Peafe, Fitches, Barly, and such like. And Columella (from whom I have taken these instructions) addeth moreover, that in the Spring time before your Hogs go abroad to bite at the sweet and fresh growing herbs, lest they provoke them to loofenein, you must give them some fodden drink, wash or swill, by vertue whereof that mischief must be avoided, for if it be not, such learness will follow, that it will overthrow and kill

Ælianus.

Varto.

In some Countries they also give them the scapes or refuse Grapes of Vintage, and moreover the fruits of yew tree, which is poyfort to Dogs. Ariftomachus the Athenian by many and fundry praifes advanceth three-leaved-grafs, and among other, for that as when it is green it is commodious for Sheep, fo being dryed it is wholesome to Swine. They love green corn, yet it is reported, that if Swine eat of it in the Ille of Salamine, their teeth by the law of the Countrey are beaten out of their mouths. It is wholefome to give them crude or raw Barly, especially to a Bore when he is to couple with a Sow, but unto a Sow with Pig fod.

There is in Baparia a kinde of Scallion which beareth a red purple-flower, like to the flower of the Lilly of the Vallies, which is greatly fought after and devoured by Swine. They also feek after wilde Vines, and the herb called Hogs-bread, and the root of wilde rapes, which beareth leaves like unto Violets, but sharper, and a white root without milk : By some it is called Buchspick, because it groweth in Woods among Beeches. They sat also flesh, and abstain not from fat Bacon, and herein they differ from most of the ravening creatures, for Dogs will not take of Dogs flesh, and Bears of Bears, yet will Hogs eat of Swines fleth, yea many times the dam eateth her young ones : And it is found that Swine have not abstain'd from the flesh of men and children, for who they have been flain by theeves, before they could be found, the greatest part of their body wastom in pieces and eaten by wilde Swine : And indeed as we fee fome Hens eat up the Egs that they themfelves have laid, fo shall we observe some Sows to devour the fruits of their own wombs, whereat we ought not to marvel as at a monftrous prodigious thing, but rather acknowledge a nutural vons

sity, constrained in them through famine and impatience.

If they also eat Snails and Salamanders, especially, the Boars of the Mountains in Cilicia, and stathough there be in Salamanders a very deadly poylon, yet doth it not hurt them at all, but aftercity, constrained in them through famine and impatience.

afterward when men or beafts tait of fuch a Swines flesh, the operation of the poylon worketh upon them mortally: neither is this any marvel, for fo it is when a Frog eateth of a Toad: and whereas them moterly all his bloud congealeth in his body and he dyech, but if a Hog eat thereof, he not only not dyeth, but thriveth and groweth fat thereby. Ariffulle reporteth one great wonder of a place about Thracia (as he faith) wherein for the compass of twenty paces there groweth Barly, whereof men eat fafely, but Oxen and Sheep, and other creatures avoid it as mortal poylon, and Swine will not vouchfafe to tast of mens excrements that have eaten thereof, but avoid them carefully.

At Swine delight in meat, so also they delight more in drink, and especially in the Summer time, and therefore they which keep fucking Sowes, must regard to give them their bellyful of drink twice a day, and generally we must not lead them to the waters as we do Goats, and Sheep, but when the heat of Summer is about the rifing of the Dog-star, we must keep them all together by water sides that fo they may at their own pleafure, both drink and lie down to wallow in the mire, and if the coalts be fo dry that this cannot be obtained or permitted, then must they have water set in troughes and veffels, whereof they may tast at their own pleasure, for otherwise through want of water they

The miery water doth most quickly make them fat, and they will drink Wine or Beer unto drun- Co'umella. kenness, and in those Countries where Grapes grow, if the Swine come into the Vintage, they grow drunk with eating of Grapes. Also if the Lees of Wine be mingled with their meat, they grow fit above measure and senseles in their fat, whereby it hath been seen that a Mouse hath eaten into the fides of a fat Hog without the refistance of the beast: and the like is reported by Pliny of the fon of L. Apronius who had been a Conful. for his body grew fo far that it was taken from him, his body remaining immoveable. And in the Spring time Swine of their own accord grow fo fat, that many times they cannot fland on their legs their bodies be fo heavy, nor go any whit, fo that if they are to be removed, they are not to be droven but to be carryed in a Carr.

Varroand Crescentiensis, do report admirable things of the fatnels of Swine. For first Varro faith, that The great fathe received knowledge from a credible honest man in Portugal, of a Swine that there was killed, the nels of Swine, offall whereof with two ribs was fent to Volumnius a Senator, which weighed twenty and three pounds, and the fat betwixt the skin and the bone, was a foot and three fingers thick. Unto this headdeth the ftory of the Arcadian Sow, who fuffered a Moufe to eat into her fat, and breed young onestherein, after she made a nest : which thing he likwise affirmeth of a Cow. And Grescentiensie reporteth of an other Lustianian Swine, which after the death, weighed five hundred seventy and five pounds, and the Lard of that Hog was one foot and three fingers broad. And the like may be said of a Hog at Bafil, nourished by a certain Oyleman, in whose Lard or fat, after his death were found many passages of mice to and fro, which they had gnawed into his body without the sense of the beaft. Hogs grow fat in short time. In antient days (as Pliny writeth) they put them up to fatting. The meat and threefcore days, and first of all they made them fast three days together, after fix days they may best manner to knibly be perceived to grow fat. There is not any beaft that can better or more cafily be accusto- fatten Hogs. med to all kinds of food, and therefore doth very quickly grow fat, the quantity and stature of their body confidered; for whereas an Ox or Cow, or Hart, and fuch like Beatls aske long time, yet a Swine which eateth of all forts of meat, doth very quickly even in a moneth or two, or three at the most, prove worthy the knife and also his Masters table, although in some places they put them up to fatting a whole year together, and how much they profit & gather in their feeding, it is very easie

for them to observe that dayly keep and attend them, and have the charge and overseeing of theth, And there must be had great care of their drink. In Thracia, after they put up a Hog to fatting, they give him drink the first day, and then let him fast from drink two days, and so give him drink by that proportion till the seventh day, afterward they observe no more diet for their Swine; but give them their fil of meat and drink till the flaughter day. In other Countries they diet them in this fort; After Beans and Peafe they give them drink aboundantly, because they are solid and hard; but after Oats and fuch like, as meal, they give them no drink, left the meal fwim up and down in their belly, and so be ejected into the excrements without any great profit. There is nothing whereon it liveth, but thereby it will grow fat except grazing, and therefore all manner of grain, Millet feed, Figs. Acorns, Nuts, Pears, Apples, Cucumbers, Roots, and fuch things cause them to rife in flesh gratefully, and so much the sooner if they be permitted to root now and then in the mire.

They must not be used to one simple, or unmingled, or uncompounded meat, but with divers compounds,, for they rejoyce in variety and change like other beafts, for by this mutation of food, they are not only kept from inflamation and windiness, but part of it alway goeth into flesh, and

Someuse to make their sty wherein they are inclosed to be very dark and close, for their more Elianus. speedy satting, and the reason is good, because the beast is more apt to be quiet. You shall have Bakers that will fat their Hogs with Bran; and in Elfatia a Countrey of Germany, they fat them with Bean meal, for thereby they grow fat very speedily, and some with Barly-meal wet with flat milk. And in the Alpes they fat them with Whay, whereby their fat and flesh groweth more white and weet then if they were fatted with Acorns, yet Whay is very dangerous: for fuch is the ravening intemperancy of this beaft, to swill in whatsoever is pleasant to his tast, that many times in drinking of Whay their bellies grow extended above measure, even to death, except that they be dieted by a wie keeper, and driven up and down not suffered to rest till it flow forth again backward.

Barly

Albertus. Ælianus.

Albertus.

Ofthe copu-

Barly is very nourishable to them, whether it be sod or raw, and especially for Sowes with Ag, Barly is very nourishable to them, whether it is touch as the farrowing causeth an easie and safe pigging for it preserveth the young ones till delivery, and at the farrowing causeth an easie and safe pigging for it preserveth the young ones till delivery, and at the farrowing Related Bran. Brewers with Ale for it preserveth the young ones the universe, and as the Meal and Bran, Brewers with Ale, or Barly And to conclude this part, Millers and Bakers fat with Meal and Bran, Brewers with Ale, or Barly

Seeped in Ale, Oylomen with the refuse of Nuts and Grapes.

seped in Ale, Oyl-men with the refuse of Nuts and Orlands. When a Sow is very fat the hath alway Some again there be that grow fat with the roots of Fern. When a Sow is very fat the hath alway Some again there be that Blow lat with make any good tidy Pigs, and yet as all other beafts grow but little milk, and therefore is not apt to make any good tidy Pigs, and yet as all other beafts grow but little milk, and therefore is not age. All fwine in hot Regions by reason of a viscous humor, lean when they give suck, so also doth Swine. All swine in hot Regions by reason of a viscous humor. grow more fat then in the cold regions. In that part of Frifia neer Germany, they fat Oxen and Swine with the same meat, for there you shall have in one stable an Ox and a Hog tyed behind him at his tail, for the Ox being tyed to the rack eateth Barly in the straw and chasse, which he swallow. at his tail, for the Ox being tyed to the foftest thereof is digested in his belly, and the other cometh eth down without chewing, and so the foftest thereof is digested in his belly, and the other cometh forth whole in his dung, which the Hog licketh up and is therewithal fatned. And it is to be remembred, that Swine gelded or fplaied, do fooner fatten then any other.

to conclude, they love the dung of men, and the reason thereof is, because the seat of their lust is in their Liver which is very broad and infatiable, and there is nothing that hath a duller fenfeofinel. ling then this Beaft, and therefore it is not offended with any carrion or flinking smell, but with

fweet and pleasant ointments, as we shall shew asterwards.

Concerning their generation or copulation, it is to be noted, that a Boar or male Swine will not remain of validity and good for breed past three year old, by the opinion of all the antient, for breed of Swine. fuch as he engendereth after that age, are but weak and not profitable to be kept and nourished. At eight moneths old he beginneth to leap the female, and it is good to keep him close from other of his kinde for two moneths before, and to feed him with Barly raw, but the Sow with Barly other of making for two montes of the Sowes; if once he hear the voice of his female defiring the fodden One Boar is sufficient for ten Sowes; if once he hear the voice of his female defiring the Boar, he will not eat untill he be admitted, and so he will continue pining, and indeed he will suffer the female to have all that can be, and groweth lean to fatten her; for which cause Homer like a wife hushandman prescribeth, that the male and female Swine be kept asunder till the time of their copulation. They continue long in the act of Copulation, and the reason thereof is, because his luft is not hot, nor yet proceeding from heat, yet is his feed very plentiful. They in the time of their copulation are angry, and outragious, fighting with one another very irefully, and for that purpose they use to harden their ribs by rubbing them voluntarily upon trees. They choose for the most part the morning for copulation; but if he be fat and young, he can endure it in every part of the year and day, but when he is lean, and weak, or old, he is not able to fatisfie his females luft, for which cause she many times finketh underneath him, and yet he filleth her while she lyeth down

on the ground, both of them on their buttocks together.

They engender oftentimes in one year, the reason whereof is to be ascribed to their meator some extraordinary heat, which is a familiar thing to all that live familiarly among men, and yet the wilde Swine couple and bring forth but once in the year, because they are seldom filled with mear, endure much pain to get and much cold, for Venus in men and beafts, is a companion of fatiety, and there fore they only bring forth in the fpring time, and warm weather, and it is observed that in what night foever a wilde Hog or fow farroweth, there will be no storm or rain. There be many cause why the tame domestical! Hogs bring forth and ingender more often then wilde; first because they are fed with eale; secondly because they live together, without fear, and by society are more often provoked to luft; on the other fide the wilde Swine come feldom together, and arcoften hungry, for which cause they are more dull and lesse venereous, yea many times they have but one stone, for which cause they are called by Aristotle and the antient Grecians Chlumes and Manuschu.

But concerning the Sow, the beginneth to fuffer the Boar at eight moneths of age, although ac-Sows Boaring. cording to the diversity of Regions and air, they differ in this time of their copulation, for some begin at four moneths, and other again tary till they be a year old: and this is no marvel, for even the male which engendereth before he be a year old, begetteth but weak, tender, and unprofitable the male which engendereth before he be a year old, begetteth but weak, tender, and unprofitable pigs. The best time of their admission is from the Calends of February unto the Vernal Equinodial, for fo it hapneth that they bring forth the young in the Summer time, for four months the goeth with young, and it is good that the Pigs be farrowed before harvest, which you purpose to keep all the year for store. After that you perceive that the Sows have conceived, then separate them from the Boars, lest by the raging lust of their provoking, they be troubled and endangered to abortment. There be some that say, a Sow may bear young till she be seven year old, but swill not fire about that whereof every poor Swineherd may give sull satisfaction. At a year old a Sow may do well, if the be covered by the Boar in the moneth of February. But if they begin not to bear till they be twenty moneths old, or two years, they will not only bring forth the stronger, but also bear they be twenty moneths old, or two years, they will not only bring forth the stronger, but also bear they be twenty moneths old, or two years, they will not only bring forth the stronger, but also bear till the stronger. the longer time even to the seventh year, and at that time it is good to let them go to rivers, fens, or miery places, for even as a Manis delighted in washing or bathing, so doth Swine in filthy wallowing in the mire; therein is their rest, joy, and repose. Albertus reporteth that in some places of Germany a Sow hath been found to bear young eight years; and in other till they were fifteen years old; but after fifteen year it was never feen that a Sow brought forth young Pigs. If the Sow be fat, fler always the lesse prone to conceive with young, whether she be young or old. When first of all they begin to feek the Boar, they leap upon other Swine, and in process cast forth a certain purgation alless which is the source of led Aprya, which is the same in a Sow which Hippomanes is in a Mare, then they also leave their brid-fellows, which kinde of behavior or action, the Lasins call by a peculiar Verb Subare, and that is applyed to Harlots and wanton Women, by Horace;

amq; subando. Tenta cubilia tellaq, rumpit.

We in English call it Boaring, because the never resteth to shew her defire till she come to a Boar. and therefore when an old Woman lusteth after a man, being past lust by all natural possibility, she is cald Asses Subans. And the Beast is so delighted with this pleasure of carnal Copulation, that many times the falleth afteep in that action, and if the male be young or dull, then will the female leap upon him and provoke him ; yea in her rage she setteth many times upon men and women. Pling especially if that they do wear any white Garments, or if their Aprya and privy place be wetted and moiftned with Vinegar. They have their proper voices and cries for this time of their Boaring. which the Boar or male understandeth presently.

the Swine.

They are filled at one Copulation, and yet for their better safegard, and to preserve them from abortment, it is good to suffer the Boar to cover her twice or thrice; and moreover, if she conceive notat the first, then may she safely be permitted three or four times together, and it is observed that except her ears hang down flagging, and careleffely, the is not filled but rejecteth the feed, but if her ers fall downward, and fo hang all the time that the Boar is upon her, then is it a most certain token

that the is filled, and hath conceived with young.

After four moneths (as we have faid) the Sow farroweth her Pigs, that is to fay, in the fifth moneth, as it were in the seventeenth week : For so is this beaft enabled by nature to bear twice in the year, and yet to fuck her young ones two moneths together. And there is no cloven-footed bealt that beareth many at a time except the Sow, except in her age, for then the beginneth to lose her Apria or purgation, and so many times miscarryeth, and manny times bear but one. Yet this is marvailous that as she beareth many, so the engendereth them perfect without blindness, lamenesse, or any such other distresse, although as we have said before, that in some places you shall see Swine whole hoofed like a Horse, yet most commonly and naturally their feet are cloven, and therefore is the wonder accounted the greater of their manifold multiplidation; and the reason thereof may arise from the multitude and great quantity of their food, for the humor cannot be so well avoided and dispersed in so little a body as Swine have, as in Mares and Cowes, and therefore that hu-Niphus. mour turneth, to multiply nature and natural kinde; and so it cometh to pass, that by overmuch humour turned into a natural feed, it breedeth much young, and for little humor it bringeth forth a fewPigs and those also are not only perfect, but also the is sufficiently furnished with milk to nourish them, till they be able to feed themselves. For as a far ground or foil is to the plants that groweth Aristotle.

onit, even so is a fruitful Sow to the Pigs, which she hath brought forth.

Their ordinary number which they bring forth and can nourish is twelve, or fixteen at the most, The number and very rare it is to fee fixteen brought up by one Sow. Howbeit it hath been feen that a Sow hath which a Sow brought forth twenty, but far more often feven, eight or ten. There is a ftory in Foftw of a Sow that beareth. brought forth thirty at a time, his words be thefe; The Sow of Anes Lavinu did bring forth thirty white Pigs at one time, wherefore the Lavinians were much troubled about the fignification of fuch a monstrous farrow, at last they received answer that their City should be thirty years in building, and being so they called it Alba, in remembrance of the thirty white Pigs. And Pliny affirmeth, that the images of those Pigs and the Sow their dam, were to be seen in his days in publick places, and the body of the Dam or Sow preserved in Salt by the Priests of Alba, to be shewed to all such as desired

to be certified of the truth of that flory.

But to return to the number of young Pigs which are ordinary and without miracle bred in their dams belly, which I finde to be fo many as the Sow hath dugs for, so many the may well nourish and give suck unto, and not more, and it seemeth a special work of God which hath made this tame beast fo fruitful, for the better recompence to man for her meat and custody. By the first farrow it may be gathered how fruitful the will be, but the second and third do most commonly exceed the first, and the last in old age is inferior in number to the first.

Juvenal hath a comparison betwixt a white Sow and an Heiser, Scropba facundior alba, more fruitful then a white Sow; but belike the white Sowes do bring more then any other colour. Now the reason of the Poets speech was, because that there was an Heiser in the days of Ptol my the Jounger, which at one time brought forth fix Calves; whereupon came the proverb of Regia Vac-Cestor a fruitful Cow, for Helenw telleth this to Aeneus. Upon the Sow and thirty Pigs there is this answer of the Oracle to the Lavinians concerning Alba;

> Cum tibi follicito secreti ad fluminis undam. Littoreis ingens inventa sub ilicibus sus Trigima capitum fætus enina jacebit, Alba solo recubans, albi circum ubera nati, Is locus urbis erit, requies ea certa laborum.

And Juvenal faich thus of it; Conspicitur sublimis aper, cui candida nomen, Scropba dedit latis Phrygibus mirabile samen, Et nunquam vifis triginta clara mamillis.

When

When the young one cometh forth of the dams belly wounded or imperfect, by reason of any harm therein received, (it is called Metacherum) and many times Swine engender Monsters, which harm therein received, it is talked at then in the greatest, because of the multitude of cels apcometh to pass order in the fitte beats whereof, fometimes there are two heads to one body, pointed for the receipt of the feed, by reason whereof, sometimes there are two heads to one body. fometimes two bodies and one head, fometime three legs, fometime two before and none behinder fuch were the Pigs without ears, which were farrowed at that time that Dion fins the Tyrant were to war against Dion, for all their parts was perfect but their ears, as it were to teach how inconfide. to war against Dion, for an time part want undertook that voyage; such are commonly found to be rately against all good countries, then of an unipeakable imalness like Dwarfs; which cannot live having no mouth nor ears, called by the Latines Aporcelli. If a Sow great with Pig do eat abundantly of Acorns, it causeth her to cast her farrow and to suffer abortment; and if the growlet, then is The less fruitful in Milk.

The History of Four-footed Beasts.

Now for the choice of a Pig to keep for store, it must be chosen from a lusty and strong dam bred in the Winter time, (as some say) for such as are bredin the heat of Summer are of less value. because they prove tender, small, and overmoist; and yet also if they be bred in the cold Winterthey are small, by reason of extreme cold, and their dams for lake them through want of milk: and more over because they through hunger pinch and bite their dugs, so as they are very unprofitable to over because they through nunger pinth and bit then days, how they are fit to be killed and eaten be nourished and preserved in the Winter time, rather they are fit to be killed and eaten

But this isto be observed for reconciliation of both opinions, namely, that in hot Countries fuch Hogsare preferred that be bred in the Winter, but in cold, fuch as are bred in Maich or Apile within ten days after their farrowing they grow to have teeth, and the Sow ever offereth herfore, most Dug to the Pig, that cometh first out of her belly, and the residue take their fortuness it falleth, one to one, and another to another, for it feemeth the regardeth the first by a na. tural inftinct, not fo much to prefer it, as that by the example thereof the refidue may be int vited to the like sucking by imitation, yet every one (as Tzuzes faith) keepeth him to his first choice. And if any of them be taken away from his Dug that is killed or fold, that dug prefently dryeth, and the milk turneth backward, and fountil all be gone, one excepted, and then it is nourished with no more then was ordained at the beginning for it. If the old Sow want milk at anytime, the supply must be made by giving the young ones fryed or parched corn, for raw corn or drink procureth loofeness; and it is best for them to be suckled in the place where their Dam usually abideth.

For weaning of them it is not good to let more then five or fix fuck of her at one time, for although every one fuck but his own Dug, yet by the multitude, the milk is dryed up: After two months old they may fafely be disjoined from their Dam and weaned, so as every year the Sow may breed eight months, and give suck four: it is best to let them feed asunder from their dams, till they have utterly forgotten to fuck. And thus much for the procreation and nourishment of old and young

Theoffice and first instituti.

This beaft loveth fociety, and to live in herds or flocks together, and therefore the Ameents have invented Hog-keepers, whom they call Swine-herds, wherein there was wont to be confidered these instructions, first he accustomed them to the found of his horn, for by that he called them abroad out of their foldsto their feedings, for they never suffered above twelve together at the trough or parcel of meat. It becometh a Swine-herd (faith Collumella) to be vigilant, diligent, industrious, and wife, for he must carry in his head the state of all that he nourisheth, both old and young, barren and fruitful; and confider the time of their farrowing, whether they be near at hand, or far off, that so none may be lost through the want of his observation; being farrowed, he must consider and look upon them to see which are fit for store, and which are not, what are their natures and probabilities; how much milk their dam is able to afford them, and how many the is to bring up, especially to regard that every Sow bring up no more then her own Pigs; for Swine being out of the sty do mingle one with another, and lose their own young ones, and when the lyeth down to give them fuck, the lendeth her paps as well to ftrangers as to her own, and therefore herein must the care and wit of the herdsman appear, for if there be many, he must shut up every Sow with her young; and if that cannot be, then with a little Pitch or Tar let him gwefeveral marks to the feveral farrows, that so his memory may not be confounded. Another remedy to avoid the confusion of young Pigs one among another, is so to frame the threshold of the flye, that the Pigs may not be able to go in and out; for the Sow can more easily go over, and fo the may be eased of their company, and they fafely included at home, and fo shall no stranger break into them; but everyone in their own nest expect the return of their dam, which ought not to exceed the number of eight; for although the focundity of Swine be great, yet it is beter to kill off two or three, if their number be above eight, then to permit them to luck their dam; for this multitude of suckers do quickly draw away all nourishment from the dam: and when they are but eight at the most, regard must be had that the Sow be well fed with sod Bir or such like. Less through a court of the like less through a court of the like. ly, or fuch like, left through a covetous pinching of the beaft, leanness follow to her overthrow and destruction. Another point of a good Swineherd, is to sweep oftentimes the stye, forth chough such be the nature of the Beast, that it desileth all things, and will be wallowing in the mire, yet will the also be very desirous of a clean lodging, and delight much in the same; and when they be shut up, they must not be enclosed like other beasts altogether, for one of them will throng and ly upon another, but there must be several porches and hatches to sever and distinguish their lodgings, fo as the great with Pig may lig in one place, and the other ready to be delivered by their lough, free from all incursion and violence. These divisions or separations ought to be some 3, or 4, foot high, fo as they may not be able to leap over to one another, and not covered, to the in. Columella. or 4. 1004 man and boy may freely look over to them, and tell them if any Palladim. chance to be missing, or else help a poor Pig when it is overlaid by his dam.

Whenfoever the Swineherd clenfeth the fty, then let him cast in fand or some other drying thing into it, that all the moisture and wetness may be drunk up. The dam ought not to be permitted for the first ten days to go forth of the stable, except to drink, and afterward let her go abroad into some adjacent pasture, not far off, that so by her often return she may the better give suck to her young ones. When the little ones are a fortnight or three weeks old, they defire to follow their parent, wherefore they must be shut up from their mother, and feed alone in her absence that they may better endure it afterward when they shall be weaned. They must be fed in the Summer time in the morning, before the heat be ftrong, and in the heat of the day led into fome watry or findowy place, that fo they may be freed from extremity till the cool of the day return again, where, in they must be suffered to seed. In the Winter time they are not to be led abroad till the frost and ice bethawed and diffolved. Ten Boars are sufficient for an hundred Sows, and although some keen five or fix hundred in a herd, as we may read in Scripture of the great herds of Swine, into which our Saviour Christ permitted the Devils to enter, yet is it not fafe or wholesome to keep above an hundred together, for a less flock or herd requireth less cost, charge, and attendance. There is a speech of Tremellius Scrofa, tending to the commendation of the cultody or nourishing of Swines for thus he writeth: Agricultura ab initio fui fludiofus, nec de pecore fuillo mihi miner cura est, quam vobu moenu pecuariu. Cui enim ea res non est communis? quis enim nostrum fundum colit quin sues babet? & quit non audierit parres noftros dicere ignavum & fumptuofum effe, qui fuccidiam in carnario fufpendit potitu ab laniario quam ex domestico fundo? That is to fay, I have been long given to follow husbandry, and I have alway had as great care of my Swine, as other men of greater cattel. For what is there, whereunto Swine are not profitable? who tilleth land, and keepeth not hogs? and who hath not heard our fathers (ay, that he is an idle ill husband which hangs up all his provision in the shambles), and liveth rather upon the Butchers, then upon his own ground? Thus far Trenellius, Another part of a good Swineherd is, to look to the gelding of his Swine, and splaying of the

females, for if all be suffered to procreate and engender, it is more danger that Swine would in short timeeat up men, rather then men Swine. The Latiner call fuch a Hog gelded Macalis, and Porcafrus, Pliny, that is Porcus castratus, the Germans, Einbarg, or Baix, from whence feemeth to he derived our Buish Barrow-hog (for fo we call a gelded male-hog) and a female Bass. The best time therefore to geld them is in the old Moon, or as we fay in the wane of the Moon, but Hefied prefribeth, that an Ox and a Boar should be gelded in the second quarter, and first day thereof, and Ariffoile is of opinion that it skilleth not what age a Boar be when he is libbed, but it is clear by the best experienced among these beasts, there are two times of gelding them; one in the Spring, and the other in the Autumn, and this is to be done after a double manner; First, by making two incitions or wounds upon his stones, out of which holes the stones are to be pressed

The second way is more perillous, yet more cleanly; for first of all at one wound or incifion they take out one stone, then that being forth, with their knife they cut the small skin which parteth the stones in the cod, and so press forth the second stone at the first wound, afterward anplying to it ordinary medicines, such as we will describe in the treatise of their diseases.

And the opinion of Varro is, that it is good to lib them at half a year old, or at a year old, or at three or four year old, for their better fatting; but best at a year, and not under half a year. When the stones are taken forth of an old Boar, suppose two, or three, or four year old, they are called by

the Latiner Polimenta, because with them they polished and smoothed garments,

The female also is gelt or splayed, (although the often bore Pigs) whereof they open the fide Felius (neer her loins) and take away from her Apria, and receptacles of the Boars feed, which being fewed up again, in thort time is enclosed in far; this they do by hanging them up by their fore-legs, and first of all they which do it most commodiously, must cause them to fast two days before; and then having cut it, they few up and close fast again the wound or incision, and this is done in the same place of the female, that the stones are to be taken out in the male (as Ariffotle writeth) but rather it appeareth by good examination and proof, that it is to be cut out on the right, against the hone (called Or facrum.) And the only cause of this Sow-gelding is, for their better growth and far- Abnexonof food; but whereas is plenty of food, there they never know it : and the inventers hereof were the Grecians, whose custom was to cut out the whole matrix. And thus much for libbing, gelding, and splaying of Swine.

This bealt is a most unpure and unclean beast, and ravening ; and therefore we use (not improper- The nature of by) to call obleane and filthy men or women, by the name of Swine or Sows, They which have fore this beat. heads, eye-lids, lips, mouth, or neck, like Swine, are acounted foolish, wicked, and wrathful: all their Adamentim. fenses (their smelling excepted) are dull, because they have no Articles in their hearts, but have Pling. thick bloud; and fome say, that the acuteness and ripeness of the soul, standeth not in the thickness of the bloud, but in the cover and skin of the body, and that those beasts which have

Y y 3

the thickest skins are accounted the most blockish and farthest from reason, but those which have the chinnels and fostelt, are the quickest of understanding; an example whereof is apparent have the chinnels and solver, are the date amarvailous understanding of the voice of their felder in the Outler, Ox, and Apc. They have a marvailous understanding of the voice of their felder and as ardent defire to come at his call, through often custom of meat, whereupon lyeth this ex. he cellent ftory.

The History of Four-footed Beasts.

Ælianus.

When certain Pirates in the Tyribene fea, had entred a Haven, and went on land, they cameto. Swines stie, and drew out thereof divers Swine, and so carryed them on Shipboard, and loofing their. Ancher's and tacklings, do depart and fail away. The Swineherds feeing the Pirats commit this robbery, and not being able to deliver and rescue their Cattle, because they wanted both company and strength, suffered the Theeves in silence to ship and carry away their Cattle; at last, when they faw the Theeves rowing out of the Port, and lanching into the deep, then they lift up their voices, and with their accustomed cries or cals, called upon their Swine to come to their meat. as soon as the Swine heard the same, they presently gat to the right side of the Vessel of Bark, and there socking together, the ship being unequally ballanced or loden, overturned all into the Sea, and so the Pirates were justly drowned in reward of the theft, and the Rolne Swine swam fafely back again to their Malters and Keepers.

The nature of this Beaft is to delight in the most filthy and notione places, for no other caule (se I think) but because of their dull fenses. Their voice is called Grunnius gruntling; Sordida fut pa cent ruit gramina grunnit; which is a terrible voice to one that is not accultomed thereunto. (for even the Elephants are afraid thereof) especially when one of them is hurt or hanged fall or bitten, then all the residue as it were in compassion condoling his misery, run to him and cru with him, and this voice is very common in Swine at all hands to cry, except he be carryed with his head upwards towards heaven, and then (it is affirmed) he never cryeth, the reason whereof is given by Aphrodisian: because it is alway accustomed to look downward, and therefore when it is forced to look upwards it is fuddenly appaled and afraid, lield with admiration of the goodly space above him in the heavens, like one astonished, holdeth his peace (some say that then the artery of his voice is pressed) and so he cannot cry aloud. There is a fish in the river Action which gruntleth like a hog, whereof Javenal speaketh, saying . Et quam remigibus grunnife Elpinara porcis. And this voice of Swine is by Cacilius attributed to drunken men. The milk of Swine is very thick, and therefore cannot make whay like a Sheeps, howbeir it fuddenly coagulateth and

Among divers males or Boars when one of them is conqueror, the relidue give obedience and veeld unto him, and the chieftime of their fight or discord is in their lust, or other occasions of food, or ftrangeness, at which time it is not fafe for any man to come neer them, for fear of danger from both parties, and especially those which wear white garments. And Strabo reportethin general of all the Belgian Swine, that they were fo fierce, strong, and wrathful, that it was as much danger to come near them as to angry Wolves. Nature hath made a great league betwixt Swine and Crocodiles, for there is no beaft that may fo freely feed by the banks fides of Nilm, as the Swine may, without all hurt by the Crocodile. Other Serpents, especially the smaller Serpents, are oftentimes devoured by Swine. Aristotle faith, that when many of them are together they fear not the Wolf, and yet they never devour any Wolf, but only with their fearing and gruntling noise fear them away. When a Wolf getteth a Swine, he devoureth him, and before he can eat him draggeth him by the ears to some water to cool his teeth in his flesh (which above measure burn in devouring his sless.) It hath been seen that a Lion was afraid of a Sow,

for at the fetting up of his briftles he ran away.

It is reported that Swine will follow a man all the day long which hath eaten the brain of a Crow in his pottage: and Nigidim affirmeth, that Dogs will run away from him that hath pulled off a tick from a Swines back. The people of Mossnacum did engender Man with Woman publickly like Swine; and Stobam writing against Women faith, that some of them are derived from one bealt, and some from another, and namely a woman descended of a Sow sitteth at home, and doth neither good nor harm : but Simonides writeth otherwife, and namely that a Woman born of a Sow fitteth at home suffering all things to be impure, unclean, and out of order, without decking, drefling or ornament, and so the groweth fat in her unwashed garments. And there are many sictions of the transforming into Swine. Homer faigneth that the companions of Uhffer were all by Greeturned into Swine, which is interpreted in this manner, Circe to fignifie unreasonable pleasure, Uhfer to fignifie the foul, and his companions the inferior affections thereof, and so were the companions of When unreasonable pleasures do overcome our affections and make'us like Swine in following our appetites: and therefore it was the counsell of Sweater, that no man should at banquet eat more then sufficient, and those which could not abstain from them, should forbear their company that perswaded them to eat when they were not hungry, and to drink when they were not thirfty, and therefore he supposed that it was said in jest that Cree turned men into Swine. When as Uhffer by his own abstinence and Mercury his counsell, was delirered and faved from that most savage transformation, which caused Horace thus to write;

Xenophon.

Horus.

Varro.

Sextus.

Pliny.

Calcaeninus.

Ulyffes fi bibiffet pocula Circes-Cum focits Vixisset canie immundus vel amica luta suc.

And from this came the original proverb of Porcellis Agamania for a tender and delicate person, used so to fulness, that aff penury is death unto him. Sweet lavours as we have shewed already, are very hurtful to Swine, effectable the fiveer oyl of Marjoram. Whereupon came the proverb Mil sum ameracino sui; and Lucretim speaketh hereof in this fort :

> Deniq; amaracinum fugitul fir, & timet omne Unquentum : nam fetiger to jubus acre venenum eft."

And for this cause Tulline Cicero faith, Illi alabastem pater unquenti plene; that is, a box of Alabaster full of ointments is displeasing to this Beast, for as the Scatabee or Horse file forsaketh sweet places to light and fit upon Horfe dung, even fo doth Swine. There be many of the antients that have de- Cællus. livered merrily Anima suis pro sale, that the Swines soul is in their body but in stead of salt to keep the flesh from stinking, even as for no other purpose many among men feem to live and retain soul in body. They are very clamorous, and therefore are used for talking and pratting fellowes, whereupon the Greek Poet Lucilius translated by Erafmu Windeth, when he faith in this manner, under Alia Menecles, alta porcellus loquitur :

Sucula bos de capra mibi periere Menecles Acmerces borum nomine penfa tibi eft. Nec mibi cum Osbryade quicquam estve fuirve negati, Nec fures ullos buc cito Thermopylis.

Sed contra Eutychidem nobis lis : proinde quid bic mi Aut Xernes facit, aut quid Lacedamonit? Ob patium & de me loquere, aut clamavero clare, Multo aliud dicit fus, allud Menecles.

And to conclude, in Latin they fay Sus Minervam, when an unlearned dunce goeth about to teach his better or a more learned man, then doth the Hog teach Pallet, or as we fay in English, the foul

There are in Swine many presages and foretokens of foul weather, as Swineherds have observed : as first if they lie long wallowing in the mire, or if they feed more greedily then they were accustomed, or gather together in their mouths, hay, stubble, or straw, as Aratu writeth; or if they leap and dance, or frisk in any unwonted fort: and for their copulation, in years that will prove moiff,

they will ever be boring; but in dryer years they are leffe libidinous.

The greatest harm that cometh by Swine is in rooting and turning up of the earth, and this they do in Corn fields, for which we have shewed that the Coprisis made a law to beat out the teeth of such Swine: for this cause Homer writeth that Itiss threatnesh Vlyses, because his companions est up all his corn, to knock out their teeth : yet fometimes the husbandmen admit them of purpole, both into their land before it be plowed, and also into their vineyards. It is said that the Espliant forbear to facrifice them, because they tread in their Corn in their fields after it is swelled out of the earth, fo as the Birds cannot gather it up again, de we have flewed before. The Jews and the Egyptians accounted this Beaft most unclean. The Jews, not as the vain Gentiles imagined, because they worshipped it, for that it taught men to plow the earth, but for the Law of God. And the Egyptians hold it a profane thing, and therefore they had an antient law, that no Swineherd should come into their Temple, or that any Man should give him his Daughter in Marriage. It is very certain that they were wont to be used in facrifices. The faid Egyptians never facrificed them to the Moon and to Bacchus, and at other times it was unlawful, either to offer them, or to eat them : but it feemeth by many Authors, that their first facrifices were of Swine, for we read of antient customs in Hetruria, that at their marriage feasts they offered and sacrificed a Sow to Venu, and at other times, especially in Harvest, they did so to Geres. The Latins do hold a Swine very grateful and facred to Jupiter, because as they believed that a Sow did first of all lend her paps to him, and therefore all of them worship a Sow, and abstain from her flesh. Likewise in Myfia and Phanicia, there were Temples of Jupiter, wherein it was forbidden to facrifice or kill Swine by a publick Law, like as it was amongst the Jews. When the Kings of Sparta were first of all chosen into that royal place, they were permitted to execute the Priefts office, and to the intent that they might never want factifices, there was a priviledge granted them to take a Pig of every Sow: and when they facrificed to Jupiter a Swine, it must be after or at a triumph: they were also facificed to Nopune, because they were impetuous and ranging Beasts; and a Boar was holy to Mars, according to this faying of Pomponius in Attellana, Mars tibi fatturum, fi unquam rediero, bidente verre. And there was a custom among the Atbentans, when a Man had flain an hundred enemies, he was permitted to offer up to Mars, some part of a man at Lemnos, and afterward they grew out of liking of this vain custom, and in stead thereof sacrificed a Barrow or gelded Hog, and when they housed their army, they did it with Hogs, Sheep or Buls, and nothing elfe, and they compassed it about three times with pomp and stately procession, and at last slew and offered them to Mars. They were wone to facrifice a Hog for a Man that had recovered his wits after he had been mad, and also they facrificed Swine to Bilvanu, according to these Verses;

Cadere Silvano porcum quadrante lavari: And again : Tellurem porco Silvanum lacte piabant.

Gillim.

Their Pagan God Terminus, had an Ewe and a young Sow offered to him (as Ovid writeth) although Their ragan Gou termine, and are the state of their ragan Gount him. To Geres and Banks, by the laws of Nume, all facrifices of living things were forbidden unto him. To Geres and Banks, we have shewed already how they were offered, and the reason of their facrificing was, because they were hurtful to all green Corn and Vings.

Prima Ceres avidigavisa est sauguine parci, Ulta fuas merita cade nocentis opes, Nam (ata vere novo teneris lattentia succis. Eruta feligera comperit ore fuis.

And again in another place he writeth thus;

Prima putatur hostia Sus meruisse mori, ____ quia semina pando Eve rtit roftre, fpemq ginterceperit anni.

The time of their facrificing to Geres was in April, wherein the Priests with Lumps and Torches, and apparelled in white garments, did first of all kill a female Swine, and then offer her; and some. and apparented in white garness, because thereby in a mystery they prayed for the fruitsulness and fecundity of the earth: and for these and such like causes we read of titles put upon them, as Perca pracidanca, for the Sow that was flain before the reaping, and Perca pracia, for the Sow that was offered at a Funeral for the lafety of all the family, wherein the dead man lived. They also was onerculat a runeral for the latery of the never bore children, and to Juno in the Calends facrificed a barren Sow to Proferping, because the never bore children, and to Juno in the Calends

of every moneth: And thus much for their facrificing.

Now we are to come to the use of Swine and their several parts; first of all it is certain that there is no Beaft leffe profitable being alive then a Hog, and yet at his latter end he payeth his Maffer there is no Beau iene proprable being any chich a log sain yet as his lacter end he payeth its maller for his keeping. Cicero said well, Sus quid babet preter esoam, oui quidem ne putrescret, animam plampto his keeping. Cicero said well, Sus quid babet preter esoam, oui quidem ne putrescret, animam plampto said that therefore the said education of the said of the said of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul thereof was given to it in stead of said to keep it from stinking; for indeed in Lions, Dogs, soul the said to said the said to keep it said to k Bears, Horfes, and Elephants, all their virtue lyeth in their minds, and their flesh is unprofitable and good for nothing, but the Swine hath no gifts at all in the minde, but in the body the life thereof keeping the flesh and body from putresaction. And there is no heast that God hath or dained for domestical provision of food and meat to man, except Hares and Conies, that is fo fruitfull as Swine are. God (as we have touched already) Levit. 11. Deut. 14. forbad his people of Ifael to eat hereof, because it was an unclean Beast not chewing the cud; and furthermore the observation of Proceedius is memorable, that whereas the Egyptians did worship with divine worthip, both Oxen, Kine, and Sheep, and would not eat of their flesh or kill them in sacrifice, yet did eat, and kill, and facrifice Swine.

The Jews were permitted and commanded to eat Oxen and Sheep, and abstain from the fish of Swine; thus manifesting how different his ways and thoughts are from the ways and thoughts of men. The Lord doth not this for policy, but to try the obedience of his people, placeth therein one part of his worship, and therefore by his Prophets, Esa. 65. and 66. calleth the eating of Swines slesh abomination, and threatnesh thereunto a certain unavoidable judgement and damnation. The woman and her seven sons which were apprehended by King Antiochem, and by him tempted to eat Swines flesh which they refused to do (being against the law of their God) are remembred as most worthy Martyrs of his Church, that endured, cutting off their hands and set, pulling out their tongue, and settling in a boyling Caldron with other exquisite toyments includent to such death, as is recorded by Jason 2. Macab. 6. We read that Heliogabalus did abstain from Swines flesh, because he was a Phenician, and they forbore to eat it. The women of Brute in

Africk, do never taft of Cowes flesh or Swines flesh.

The Arabian Scenites never eat hereof, and Swine cannot live in their Countries. (Cuffin and Elianus affirme) that in India there are no Swine, either tame or wilde, and that the Indian do as much forbear to eat of Swines flesh, in detestation thereof, as they do of Mans flesh.

Now concerning the flesh of Swine, many opinions are held about the goodness and evill thereof, yet Hippocrates writeth, that Porcine carnes prave funt quum fuerint crudiores & ambuile, megu auten cholcram generant, & turbationem faciunt, Suille carnes optime funt omnium carnium; that is, The fielh of a Boar being raw or roafted, is worft of all other, because it engendereth Choler and wilde windy matter in the stomach; but the stesh of a Sow is the best of all flesh, with this proviso, that it net ther exceed in fatness, leanness, or age.

There is a merry and witty answer of a memorable Noble man to an old Gentlewoman (if not a Lady) who dispraised Bacon at the Noble mans table, and said it was a churlish, unpleasant meat The Lord understanding a privy Emphasis in that speech against himself, (for his name was written with those Letters and syllables) answered her: you say truth, if the Bacon be a piece of an old

Sow (as peradventure the feemed to be at that time.) The best opinion about the concoctive quality of this flesh is, that then it is best when it is he middle age, neither a Pig, nor an old Hog, for a Pig is over moist, like the Dam which is the moistest of all other earthly Beasts; and therefore cannot but engender much slegme: and for this cause the fattest are reproved for a good diet, for that it cannot digest well through over much

29 1000 Of the Swine.

And the old Swine are most hard of Concoction, (yearthough they be scorched or sindged at the fire) because thereby is increased in their flesh much acrimony and tharpness, which in the stomach of men turneth into Choler: for they bite all the veffels reaching to the stomach, making a derivation of all those ill humors into the belly and other parts.

ration of all those in trainous into the being and other parts.

Ido, not like their opinion, which think that it is better cold then hot, for fear of inflamation; this rule is good in the Heft lof Goats (which are exceeding hot) but in Swine, where is no predominancy but of moisture, it is better to eat them hot then cold, even as hot Mik is more wholefome then cold. Hippocrates doth prescribe the eating of Swines fiesh in the fickness of the Spleen, and Collins Antelianus forbiddeth the same in the Palsie or Falling fickness.

Galen is of opinion that Care percina potentisfime nutrit, nourisheth most strongly, and potently; whereof he giveth an instance for a reason taken from Champions, Combatants, or Wrestlers, if the day before they wreftle or fight, they feed on an equal quantity of any other flesh, they feel themselves weak and feeble in comparison of that is gathered from Swines flesh : and this (he saith) may be tryed in Laborers, Mioners, Diggers, and Husbandmen; which retain their strength as well (if not better) by eating of Swines flesh or Bacon as any other meat: For as Beet in thickness and folidity of substance to the eyes appearance, excelleth Pork or Bacon, so Pork and Bacon excelleth and is preferred before Beef, for a clammy nourithing humor. And this comparifon betwixt Pork and Beef, Galen amplyfieth farther in these words, Of Swines flesh, those are beft for men in their middle and ripe age, which are of Hogs of an answerable age, and to other which are but growing to a ripenels and perfection, Pigs, Sheates, and young growing Swine, are most nourishable. And on the contary, young growing Oxen are most nourishable to men of perfect years and Brength, because an Ox is of a far more dry temperament then

A Goat is leffe dry then an Ox; and yet compared to a Man or a Swine, it excelleth both of them; for there is a great refemblance or similitude betwixt a Mans flesh and Swines flesh, which some have proved in taft, for they have eaten of both at one Table, and could finde no difference in one from the other ! For some evill Inn-keepers and Hoasts have so deceived men, which continued a great while, not descrived or punished, untill at last the finger of a man was mixed therewith, and being found, the Authors received their reward. Swines fiell also is leffe excremental then Pigs fich, and therefore more nutrible, for the moifter that the flesh is, the sooner it is dispersed, and the vertue of it avoided, and old Swine notwithstanding their primitive and natural moisture, yet grow very dry, and their flesh is worst of all, because in nature humidity helpeth the concocti-

gradis licaretala (° 45) Significareta Prancisso

All Swines flesh being concocted engendereth many good humors, yet withat they contain a kind of glutinous humor, which stoppeth the liver and reins, especially in those which by nature areapt to this infirmity. And although some are of opinion, that the wilde Boar is more nourishable then the tame Swine, because of his laborious course of life, and getting his prey; yet it appeareth that the tame Swine by their resty life, and easie gathering of their meat, are made more sitter nourishment of man, for they are more moist and Swines slesh without convenient moisture (which is many times wanting in wilde Boars) is poyfon to the stomach, and yet for a man that hath propounded to himself a thin extenuating diet, I would wish him to forbear both the one and the other, except he use exercise, and then he may eat the ears, or the cheeks, or the feet, or the hallet, if they be well fod or dreffed : provided they be not fresh, but sauced or powdred; And it is no marvel that Swines flesh should so well agree with ours, for it is apparent that they live in dirt. and love to muddle in the fame.

And fany man ask, how it cometh to passe, that Swine which both feed and live so filthily should be so nourishable to the nature of man; some make answer, that by reason of their good conflitution of body, they turn ill nutriment to a good flesh: for as men which be of a found, perfect, and healthy disposition or temperature, are not hurt by a little evill meat, which is hard of digestion; even so is it with well constituted and tempered Swine, by continual feeding upon evill things, they grow not only to no harm, but also to a good estate, because nature in process of time draweth good out of evill: But if men which have moist stomachs, do eat of Swines stesh, then do they fuffer thereby great harm, for as water powred on wet ground, increaseth the dirt : fo moiftneis put upon a moist stomach, increaseth more feeblenes: but if a man of a dry and moist stomach do eat hereof, it is like rain falling into a dry ground, which be getteth and engendereth many wholesome fruits and hearbs. And if a Swine be fatted with dryed figs or nuts, it is much more wholesome. With Wine all Swines flesh is most nourishable, and therefore the University of Salernum, prescribed that in their verses to the King of England, and also they commended the loines and guts :

Ilia porcerum bona sunt, mala sunt reliquerum.

And Fiera describeth the eating of Hogs-flesh in this manner;

Swibi canofo fit cand domeficie ore, Grata ferat nobis mensa byemalis aprum. The licet currat de vertice montie, aquose Lue licet currat de vertice montre, aquoje

Carnia, erit, pluri, sed tamen apta oito est.

And whereas Hipperster commended Swines flesh for Champions and Combatains; it is certain that Billy the Champion through eating of Swines flesh, fell to such a height of choler, that he

cast it upwards and downwards.

At it upwards and downwards.

When the womb of a Woman is ulcerated, let her abstain from all Swines flesh, especially the eldest and the youngest. It is not good for any man to tast or eat this sless in the Summer time or any hot weather, for then only it is allowed when extreme frosts have tempered it for mans Romach, and the stomach for it: the flesh of wilde Swine is most of all hurrful to them that live at eafe, without exercise, because that they are immoderately given to sleep. Some are of opinion that a fow which is killed immediately after the Boar hath covered her, is not fo wholesome asother: Heliocabalid observed this custom, to eat one day nothing but Phesant Hens, another day nothing but Pullen, and the third day nothing but Pork.

Eralmus. Macrobius.

There was in antient time a dift of meat called Trojanu, the Trojan Hog, in imitation of the Troign Horfe, for as that was fluffed within with many armed men, fo was this with many leverall meats, and whole Beafts, as Lambs, Birds, Capons, and fuch like, to ferve the appetites of the most frange belly-gods, and Architects of gluttony; and therefore Cincius in his oration, wherein he perswaded the Senators and people to the law Fannia, reproveth this immoderate riot in banquets. In apponendo menfir porcum Trojanum: and indeed it wanted not effect, for they forbad both Porcum Trojanum, and Callum Aprugnum.

There was another Raven-monster-dish (called Pinax) wherein were included many Beasts, Fowler Egges, and other things which were distributed whole to the guests: and no marvell, for this Beast was as great as a Hog, and yet gilded over with filver. And Hippolocus, in his Epiftle to Lynnus. speaking of the banquet of Caramie, faith thus, Allatus est nobis etiam porcus dimidia parte diligemerelle five toftw, & dimidia altera parte tanquam ex aqua molliter elizus, mira etiam coqui industria ita paratu, ut qua parte jugulatus esset, & quomodo variis deliciis resertus ejus vener non appareat. There was brought to us a Hog, whereof the one half was well roafted, and the other half or fide well fod, and this was fo industriously prepared by the Cook, that it did not appear where the Hog was slain or received his deadly wound, nor yet how his belly came to be stuffed with diversand fundry excellent and delicate things. The Romans had a fashion to divide and distribute a Hog, which appeareth in and the same of these Verses of Martial;

Vobifem.

Iste tibi faciet bona Saturnalia porem, Inter foumantes ilice pastus apros.

And of the eating of a sucking Pig, Martial also writeth in this manner;

Latte mero pastum pigra mibi matris alumnum Ponat . & Ætolo de sue dives edat.

I might add many other things concerning the eating and dreffing of Swines fieth, both youngand

old, but I will paffe it over, leaving that learning to every Cook, and Kitchin-boy-Concerning Bacon, that which is cald by the Latins, Perna, I might add many things, neither improper, nor impertinent, and I cannot tell whether it should be a fault to omit it in this place. The word Perna after Varro, seemeth to be derived from Pede, but in my opinion, it is more confonant to reason, that it is derived from the Greek word Pterna, which is the ribs and hips of the Hog hanged up and falted, called by Martial Petalo, and by Plautus Ophthalmia, Horaum, Sombres and Laridunn :

Palladius.

Quanta pecus pestis veniet, quanta labes larido.

The time of the making of Bacon, is in the Winter feafon, and all the cold weather, and of this Martial writeth very much in one place;

> Musteus est, propera, charos ne differ amicos. Nam mihi cum vetulo sit petasone nibil.

Et pulpam dubio de petasone voras. . -Gretana mibi fiet, vel massa licebit De menapie lauti, de petasone vorant.

Strabo in his time commended the Bacon of the Gaules, or of France, affirming that it was not is feriour to the Aften or Locien, an old City of Spain (called Pempelon) neer Aquitania, was also famous

tor Bacon. They first of all killed their hogs, and then burned or scalded off all their hair, and after for pacon. a little feafon did flit them affunder in the middle, laying them upon falt in some tub or deep trough. and there covering them all over with falt, with the skin uppermost, and so heap flitch upon flitch, till all be falted, and then agains they often surned the fame, that every part and fide, might receive his feafon, that is, after five daies; laying them undermost which were uppermost, and those uppermost which were undermost. Then after twolve days falling, they took all out of the tub or trough. rubbing off from it all the falt, and so hanged keup two days in the winde, and the third day they all to anoint it with o'yl, and did hang it up two days more in the smoak; and afterward take it down again, and hang it or lay it up in the larder, where all the meat is preferred, fill looking warily unto it, to preserve it from Mice and Wormes: And thus much shall suffice at this time for the slesh of Hogs, both Pork and Bacon.

The milk of a Sow is fat and thick, very age to congeal, and needeth not any runnet to turn it: ir breedeth little whay, and therefore it is not fix for the ftomach, except to procure vomiting, and because it hath been often proved, that they which drink or eat Sow milk fall into scurfs and Leprofies, (which dileafes the Afrans hate above all other) therefore the Egyptians added this to all the relidue of their reasons, to condemn a Sow for an unclean and filthy beaft. And this was pe-

culiarly the faying of Manethon.

1.11 2.4. 3

With the skins of Swine which the Grecians did call Phoning, they made shoo-leather, but now a The use of days by reason of the tenderness and looseness thereof, they use it not, but leave it to the Sadlers, their skins. and to them that cover Books, for which cause it is much better then either Sheep or Goats skins, for it hath a desper grain, and doth not fo easily fall off. Out of the parings of their skins they make a kinde of glew, which is preferred before. Taurocollum, and which for similitude they call Cheerocollum. The fat of Swine is very pretious to liquor shoots therewithal. The Amber that is in common use groweth rough, rude, impolished; and without clearness, but after that it is fod in the greate of a Sow that giveth fuck, it getteth that nitour and thining beauty, which we finde to be in it.

Some mix the bloud of Hogs with those medicines that they cast into Waters to take fishes, and the Hunters in fome Countries when they would take Wolves and Foxes, do make a train with a Hogs liver fod, cut in pieces and anointed over with hony, and to anointing their shoos with Swines greafe, draw after them a dead Cat, which will cause the beast to followafter very speedily. The hairs of Swine are used by Cobblers and Shoomakers, and also with them every Boy knoweth how to make their Nose bleed. The dung is very sharp, and yet it is justly condemned by Columbia for no ufe, no not to fatten the earth, and Vines offoare burned therewithal, except they be diligently wa-

tered or reft five years without ftirring.

In Plinies time they fludied to enlarge and make their Lettice grow broad, and not close together, Theophrafine. which they did by flitting a little the falk, and thrusting gently into it some Hogs dung. But for trees there is more especial use of it, for it is used to ripon fruit and make the trees more plentiful. The Pomegranats and Almonds are sweetned hereby, and the Nuts easily caused to fall out of the shell Likewise, if Fennel be unsavory, by laying to the root thereof either Hogs dung, or Pigeons dung, it may be cured; and when any Apple tree is affected and razed with Worms, by taking of Swines dung, mixed and made fost like morter with the urine of a man layed unto the 1001, it is recovered, and the Wormes driven away: and if there be any rents or stripes visible upon trees, fo as they are endangered to be loft thereby, they are cured by applying unto the fixipes and wounds this dung of Swine.

When the Apple trees are loofe, pour upon their roots the stale of Swine, and it shall establish and fettle them, and wherefoever there are Swine kept, there it is not good to keep or lodge Horses, for their smell, breath, and voice, is hateful to all magnanimous and perfect spirited Horses. And thus much in this place concerning the use of the several parts of Swine, whereunto I may add our English experiments, that if Swine be suffered to come into Orchards, and dig up and about the roots of the Apple trees, keeping the ground bare under them, and open with their nofes, the benefit that will arise thereby to your increase of fruit will be very inestimable. And here to save my self of a labor about our English Hoge, I will describe their usage out of Mr. Tusses hus. Tusses hus. bandry, in his own words, as followeth: and first of all for their breeding in the Spring of the year he writeth in general;

Let Lent well kept offend not thre. For March and April breeders be.

And of September he writeth thus:

To gaber sime mast it shall stand thee upon, With fervant and children yer mast be all gone. Some left among bufhes fball pleasure thy Swine, For fear of a mischief keep Acornes fro kine. For routing of pasture ring Hogye bave need, Which being well ringled, the better doth feed. Though young with their elders will lightly keep best Tet frare not to ringle both great and the reft.

Yoke seldome thy swine, while shacke time doth last, For divers misfortunes that bappen too faft, Or if you do fancy, whole eare of the Hog. Give car to il neighbor, and ear to his Dog. Keep bog I advise thee from medow and Corne, For out aloud crying, that ere be was borne. Sugh lawleffe fo haunting both often and long, If dog fet him chaunting be doth thee no wrong.

Pliny.

Ælianus.

And again in Octobers husbandry he writeth;

Though plenty of Acernes, the Porkelings to fat Not taken in scalen may perish by that, If ratling or swelling get once in the throat, Thou lesest thy porkling a Crown to a Groat. What ever thing fat is, again if it fall, Thou venterest the thing and the fatnesse withall. The fatter, the better, to sell or to kill, But not to continue, make proof if you will

In November he writeth again;

Let Hog once fat, lose none of that;
When most is gone, Hog falleth anon,
Still fat up some, till Shrovetide come,
Now Porke and souce bears tacke in a bouse.

Thus far of our English husbandry about Swine. Now followeth their diseases in particular,

of the diseases of Swine.

TEmlock is the bane of Panthers, Swine, Wolves, and all other beafts that live upon derou. ring of flesh, for the Hunters mix it with flesh, and so spread or cast the flesh so povioned abroad in bits or morfels to be devoured by them. The root of the white Chamelion mixed with fryed Barly flour. Water and oyl is also poylon to Swine. The black Ellebor worketh the fame effect upon Horses, Oxen, and Swine, and therefore when the beasts do eat the white, they forbear the black with all wearifomeness. Likewise Henbane worketh many painful convulsions in their bellies; therefore when they perceive that they have eaten thereof, they run to the watersand gather Snails or Sea-crabs, by vertue whereof they escape death, and are again restored to their health. The hearb Goosesoot is venemous to Swine, and also to Bees, and therefore they will never light upon it, or touch it. The black Night-shade is present destruction unto them, and they abstain from Harts tongue, and the great bur, by some certain instinct of nature. If they be bitten by any Serpents, Sea-crabs, or Snails, are the most present remedy that nature hath taught them. The Swine of Southia by the relation of Pliny and Ariffule, are not hurt with any poylonexcept Scorthe Swine of somme by the relation of rany and sarpone, are not not with any positive Korpions, and therefore so some sever they are stung by a Scorpion, they die if they drink. And thus much for the poyson of Swine. Against the cold (of which these beasts are most impatient:) the best remedy is to make them warm slies, for if it be once taken, it will cleave safer to them, then any good thing, and the nature of this beast is, never to eat if once he feel himself fick, and therefore the diligent Mafter or keeper of Swine, must vigilantly regard the beginnings of their diseases, which cannot be more evidently demonstrated, then by forbearing of their meat.

of the Measels.

The Mease's are called in Greek, Chalaza; in Latin, Grandines; for that they are likehaillones fored in the flesh, and especially in the leaner part of a Hog, and this disease, as Arifinite witten, is proper to this Beast, for no other in the world is troubled therewith: for this cause the Grecians call a Measily Hog, Chalaror, and it maketh their slesh very loose and soft. The Gramau call this disease Finnen, and Finnen; the Italians, Gremme; the French, Sansume, because the spots appear at the root of the tongue like white seeds, and therefore it is usuall in the buying of Hog in all Nations to pull out their tongue and look for the Measels, for if there appear but one upon his tongue, it is certain that all the whole body is infected. And yet the Butchers do all affirm that the cleanest hog of all, bath three of these, but they never hurt the swine or his slesh, and the Swine may be full of them, and yet none appear upon his tongue, but then his voice will be altered and not be uses wont.

These abound most of all in such Hogs as have steffly legs and shoulders very moist, and if they be not over plentiful, they make the steffl the sweeter; but if they abound, it taketh like slock-fish or meat over-watered. If there be no appearance of these upon their tongue, then the chap-man or buyer pulleth off a bristle from the back, and if bloud follow, it is certain that the beast is intected, and also such cannot well stand upon their hinder legs. Their tail is very round. For remedy hereof divers days before their killing, they put into their wash or swill some ashes, especially of Hasel trees. But in France and Germany it is not lawful to sell such a Hog, and therefore the poor people do only eat them. Howbeit they cannot but engender evil humors and naughty bloud in the body.

The roots of the bramble called Ramme, beaten to powder and cast into the holes, where Swine use to bath themselves, do keep them clear from many of these diseases, and for this cause also in antient time they gave them Horse-siesh sodden, and Toads sodden in water, to drink the broath of them. The Bur pulled out of the earth without Iron, is good also for them, if it be stamped and put into milk, and so given them in their wash. They give their Hogs here in England red-lead, red-oker.

Of the Spine.

Oker, and in some places, red loam or earth. And Pliny faith, that he or she which gathereth the aforesaid Burre, must say this charm:

Het est berba Argemon Quam Minerva reperit; Suibus bis remedium Qui de illa gustaverint.

Arthis day there is great praise of Maiden-hair for the recovery of Swine, also holy Thisle, and the root of Gunban and Harts-tongue.

Of leannesse or pining.

Ometime the whole herd of Swine salleth into leannesse, and so forsake their meat, yea although they be brought forth into the fields to feed, yet as if they were drunk or weary, they see down and steep all the day long. For cure whereof, they must be closely shut up into a warm place, and made to said one whole day from meat and water, and then give them the roots of wilde Cumber beaten to powder, and mixed with water, let them drink it, and afterward give them Beans pulse, or any dry meat to eat, and lastly warm water to procure vomit, as in men, whereby their stomacks are emptied of all things both good and bad: And this remedy is prescribed against all incertain diseases, the cause whereof cannot be discerned; and some in such cases do cut off the tops of the tails, or their ears, for there is no other use of setting these beasts bloud but in their veins.

Of the Pestilence.

These beasts are also subject to the Pestilence, by reason of earth-quakes and sudden insections in the air, and in such affection the beast hath sometime certain bunches or swellings about the neck, then let them be separated; and give them to drink in water the roots of Dasadill:

—— Quatit agros tussis anbela sues Ac faucibus angit obesis tempore pestie.

Some give them Night-shade of the wood, which hath great stalks like cherry twigs, the leaves to be eaten by them against all their hot diseases, and also burned snails, or Pepper-wort of the Gaden, or Lastica fatida cut in pieces, sodden in water, and put into their meat.

Of the Ague.

In ancient time (Varro faith) that when a man bought a Hog, he covenanted with the feller, that it was free from ficknesse, from danger, that he might buy it lawfully, that it had no mannese or Ague.

The signs of an Ague in this beast are these.

When they stop suddenly, standing still, and turning their heads about, fall down as it were by a Megrim, then you must diligently mark their heads which way they turn them, that you may let them bloud on the contrary ear, and likewise under their tail, some two singers from their buttocks, where you shall sinde a large vein fitted for that purpose, which first of all we must best with a rod or piece of wood, that by the often striking it may be made to swell, and afterwards open the said vein with a knife: the blood being taken away, their tail must be bound up with Osier or Elm twigs, and then the Swine must be kept in the house a day or two, being sed with Briymeal, and receiving warm water to drink as much as they will.

Of the Cramp.

When Swine fall from a great heat into a sudden cold, which hapneth when in their travel they suddenly lie down through wearinesse, they fall to have the Cramp, by a painfull convultion of their members, and the best remedy thereof, is for to drive them up and down, till they wax warm again, and as hot as they were before, and then let them be kept warm still, and cool at great leisure, as a horse doth by walking, otherwise they perish unrecoverably, like Calves which never live after they once have the Cramp.

Hey are many times to infested and annoyed with Lice, that their skin is eaten and gnawn Hey are many times to interest whereof, fome annoynt them with a confection made of I through thereby; for remedy wheters, the through them, after they have washed Cream, Butter, and a great deal of Salt: Gehere again anoynt them, after they have washed Cream, Butter, and a great deal of Sale.

Cream, Butter, and a great deal of Sale. aker, red Oaker, and greafe.

of the Lethargy.

Ry reason that they are much given to sleep in the Summer time, they fall into Lethargies, and By reason that they are made whereof is, to keep them from fleep, and to wake them when. foever you finde them afleep.

of the head-aches.

His disease is called by the Grecians, Scotomia, and Kraura, and by Albertus, Frarelia. Here, with all Swine are many times infected, and their ears fall down, their eyes are also dejected. with all swine are many times inhered together in their heads, whereof they die in mulitudes, by reason of many cold humours gathered together in their heads, whereof they die in mulitudes, by reason or many columnitudes, and this ficknesses fatall unto them, if they be not holpen within as they do of the pestilence, and this ficknesses fatall unto them, if they be not holpen within st they do or the pennence, what the remedy whereof (if there be any at all) is to hold Wine to their notifies three or four dayes. The remedy whereof (if there be any at all) is to hold Wine to their notifies first making them to smell thereof, and then rubbing it hard with it, and some give them also the ment making them to interfered, and that it to their meat, but if it fall out fave them also the soots of white Thifties, cut fmall and beaten into their meat, but if it fall out fat in this pain they soots of white I mittes, cut man and beatt mill die by and by after, as Pliny and Anflole write.

of the Gargarisme.

His disease is called by the Latines, Rancedo, and by the Grecians, Branchos, which is a swelling about their chaps, joyned with Feaver and Head-ache, spreading it self all over the throat like as the Squinancy doth in a man, and many times it begetteth that also in the Swine, which may be known by the often moving of their feet, and then they die within three dayes, for the best can not eat being so affected, and the disease creepeth by hittle and little to the Liver, which when it hath touched it, the bealt dieth, because it putrisseth as it passeth. For remedy hereof, give unto the beaft those things which a man receiveth against the Squinaney, and also let him blood in the root of his tongue, (I mean in the vein under the tongue) bathing his throat with a greatest of hot water mixed with Brimstone and Salt.

This disease in Hogs is not known from that which is called Struma, or the Kings evil at the first appearance, as Ariffotle and Pliny write: the beginning of this disease is in the Almonds, orkernels of the throat, and it is caused through the corruption of water which they drink; forthe cure whereof, they dethem bloud as in the former difease, and they give them the Yarrowmith the broadest leaves. . There is a Hearb called Herba impia, all hoary, and outwardly it lookethilke Rosemary, some say it is so called because no beast will touch it, this being beaten in pieces bemint two tiles or stones, groweth marvellous hot, the juice thereof being mixed in milk and Wine, and fo given unto the Swine to drink, wureth them of this difeafe, and if they drink it beforethey be affected therewith, they never fall into it, and the like is attributed to the hearb Trinity, and Vide

of the Kernels.

Fiele are little bunches rifing in the throat, which are to be cured by letting bloudin the A shoulder, and unto this difease belongeth that which the Germans call Rangen, and elb lialiens, Sidor, which is not contagious, but very dangerous, for within two dayes the beat toth de thereof, if it be not prevented ! This evil groweth in the lower part or chap of the Swines mouth, where it doth not fwell, but waxing white, hardeneth like a piece of horn, through pain whereof the beaft cannot eat, for it is in the space betwint the forecand the hinder teeth; the remedy is to open the Swines mouth as wide as one can, by thrusting into it a round bat, then thrust a shap needle through the same fore, and lifting it up from the gum, they cut it off with still half of white still half of the same still room of white still half of the same still room of white still half of the same still room of white still half of the same still room of white same still room of white same still room of the same still room of th Gentian to drink, as a speciall medicine, which the Gomuno for that cause call Ranger cruft Bit it most fure way is the cutting it off: and like unto this there is fuch another growing in the upper chap of the mouth, and to be cured by the fame remedy: the cause of both doth arise stome of their meat over hot, and therefore the good Swineheard must labour to avoid that militain. The mischief of this is described by Virgil:

> Hinc canibu blandie rables venit, & quatit ægros Tussis andela sues, ac faucibuiar git abe sis.

Of the pain in their Lungs.

Por all manner of pain in their Lungs, which come by the most part for want of drink, are to have Lung-wort stamped and given them to drink in water, or else to have it tyed under their tongues two or three dayes together, or that which is most probable, because it is dangerous to take it inwardly, to make a hole in the ear, and to thrust it into the same, tying it fast for falling out; and the same vertue hath the white Hellebor. But the diseases of the Lungs are not very dangerous, and therefore the Butchers fay, that you shall seldom finde a Swine with sound Lungs or livers: sometimes it falleth out that in the Lights of this Beast there will be apparent certain white foots as big as half a Walnut, but without danger to the Beaft, sometimes the Lights cleave to the ribs and sides of the Beaft, for remedy whereof you must give them the same medicines, that you give unto Oxen in the same disease. Sometimes there appear certain blathers in the Liver of water. which are called water-gals; sometimes this is troubled with vomiting, and then it is good to give them in the morning, fryed peafe mingled with dust of Ivory, and bruised Salt fasting, before they go to their pastures.

Of the diseases in the Spleen.

TO Y reason that this is a devouring Beast, and through want of water, it is many times sick of he Spleen, for the cure whereof you must give them Prunes of Tamariske pressed into water, to be drunk by them when they are a thirst; this disease cometh for the most part in the Summer, when they eat of sweet and green fruits, according to this verse;

Strata jacent paffim sua quaq; sub arbore poma.

The vertue of these Prunes of Tamarisk is also very profitable against the diseases of the Milt. and therefore it is to be given to Men as well as to Beafts, for if they do but drink out of pots and cups made out of the wood of the tree Tamariske, they are easily cleared from all diseases of the Soleen; and therefore in some Countries of this great tree they make Hog troughes and mangers, for the safegard of their Beasts, and where they grow not great, they make pots and cups. And if a Hogdo eat of this Tamarisk but nine dayes together, at his death he shall be found to be without a Spleen, (as Marcellus writeth.) When they become loose in their bellies, which happeneth to them in the Spring time by eating of green Herbs, they either fall to be lean, or else to die. When they annot easily make water, by reason of some stoppage, or sharpness of Urine, they may be ealed by giving unto them spurge-seed. And thus much for the diseases of Swine. For conclusi on whereof I will add hereunto the length of a Swines life, according to Ariffule and Pliny, if it be notcut off by sickness or violent death, for in their dayes they observed that Swine did live ordinarily to fifteen years, and some of them to twenty; And thus much for the nature of Swine in general.

The medicines of the Hog.

The best remedy for the bitings of venomous Serpents is certainly believed to be this, to take Actius. some little creatures, as Pigs, Cocks, Kids, or Lambs. and tear them in pieces, applying them whiles they are hot to the wound as foon as it is made, for they will not only expell away the poyfon, but also make the wound both whole and sound. For the curing of Horses which are troubled with the inflammation of the Lungs; Take a lucking Pig and kill him neer unto the fick Horse, that you may instantly pour the bloud thereof into his jawes, and it will prove a very quick and speedy remedy. The panch of a fucking Pig being taken out and mingled with the yolk which flicketh to the inner Marcellus. parts of the skin, and moistned both together, doth very much ease the pain of the teeth being poured into that ear, on which fide the grief shall lie.

The liquor of Swines flesh being boyled, doth very much help against the Bupreflis. The same is allo a very good antidote against poylon, and very much helpeth those which are troubled with the Gowt. Cheese made of Cowes milk being very old, so that it can scarce be eaten for tartness, being in the liquor or decoction of Swines flesh which is old and salt, and afterwards throughly tempered, doth very much mollifie the stifness of the joynts, being well applyed thereunto.

The Indians use to wash the wounds of the Elephants which they have taken first with hot water, Elianus, afterwards if they fee them to be somewhat deep, they anointed them with Butter: then do they affwagethe inflamation thereof, by rubbing of Swines field upon them, being hot and moist with the fresh bloud issuing from the same. For the healing of the wounds of Blephants, Butter is chiefly commended, for it doth eafily expell the iron lyrage hid therein, but for the curing of the Ulcers, there is nothing comparable to the flesh of Swine. The bloud of Swine is moist, and not very hot, being in temper most like unto mans bloud, therefore whosoever faith that the bloud of men is profiable for any difeafe, he may first approve the same in Swines bloud : but if it shew not the same, it may in a manner thew the like action.

For

Marcellus.

Pliny.

Galen.

For although it be fomewhat inferiour unto mans bloud, yet at the least it is like unto it; by For although it be iomewhat interior and the by the use thereof, more full and ample profit unto knowledge whereot, we hope we man werto our expectation, notwithstanding there is no such men. For although it do not fully answer to our expectation, notwithstanding there is no such men. For attnough it up not turny an word. For the encouraging of a feeble and diminished great need that we mould prove mens bloud. For the second in wine, and given in drink, to Horfe, Eumeline reporteth, the flesh of Swine being hot, mingled in wine, and given in drink, to Horie, Eumenine reportetin, the ment of swinted by Swine another excellent medicine against be exceeding good and profitable. There also ariset by Swine another excellent medicine against be exceeding good and profitable. There also ariset by Swine another excellent medicine against be exceeding good and prontable. There also attricts by distributed exceeding good and prontable. I necessity attributed good and prontable. I necessity attributed good and prontable against divers perillous difeases, which is this, to kill a young gelded Boar Pig, having red hairs, and being divers perillous difeases, which is this, to kill a young gelded Boar Pig, having red hairs, and being divers perillous diteales, which is this, to kin a young general right arms red hairs, and being of a very good strength, receiving the fresh bloud in a pot, and to stir it up and down a great while together with a stick made of red Juniper, casting out the clots of the bloud, being gathered while

15 thirring.
Then to cast the scrapings of the same Juniper, and stir the berries of the Juniper in the same to the quantity of feven and twenty, but in the stirring of the same, let the clots be still cast out. Afterwards mingle with the same these hearbs following. Agrimony, Rue, Phy, Scabious, Betony, Pimpernel, Succory, Parsly, of each a handfull. But if the measure of the bloud exceed three pints, put unto it two ounces of Treacle! but if it shall be bigger, for the quantity of the bloud pints, put unto it two ounces of the Treacle. (But all things ought to be for prepared that they you shall diminish the measure of the Treacle.) These being the prepared that they you man duminity the meaning hot from the Boar.) These being mixed all together, you must may ne put to the blond coming which you must dry in the sun, being diligently kept in a glassed draw forth a dropping liquor, which you must dry in the sun, being diligently kept in a glassed draw forms dropping inquot, which you must do once every year, for it will last twenty year, vessellell for eight dayes together, which you must do once every year, for it will last twenty year. This medicine is manifestly known to be a great preservative against these diseases following, namely the Plague, impostumes in the head, sides, or ribs, as also all diseases whatsoever in the namely the Plague, importunces in the head, itues, or they, as who has desired in the look, Lungs, the inflammation of the Milt, corrupt or purified bloud, the Ague, swellings in the body, thaking of the heart, the Dropsie, heat in the body above nature, evill humors, but the principal left and chiefest vertue thereof is in curing all poysons, and such as are troubled with a noysome

Let him therefore who is troubled with any of the aforesaid diseases, drink every morning a spoonful, or four or five drops of the same liquor, and sweat upon the same, and it will in very thort time perfectly cure him of his pain. Some also do use Almonds pounded or beaten in the bloud against the Plague, the liquor being extracted forth by the force of fire. A young Pig being killed with a knife, having his bloud put upon that part of the body of any one which is troubled with warts being as yet hot come from him, will prefently dry them, and being after washed, will quite expell them away. The bloud of a Sow which hath once pigged being anointed

upon women, cureth many diseases in them. The brains of a Boar or Sow being anointed upon the fores or Carbuncles of the privy members, doth very effectually cure them, the same effect also hath the bloud of a Hog. The dugs of a woman anointed round about with the bloud of a Sow, will decrease leffe and leffe. A young Pig being cut in pieces, and the bloud thereof anointed upon a Womans dugs, will make them that

they shall not encrease. Concerning the greafe of Swine, it is termed diversly of all the Authors, for the Greeton call it Stear Choirion, and Oxungion, for the imitation of the Latin word Axungia; but Marceller allo applyeth Axungia to the fat of other creatures, which among the ancient Authors I do not finde: for in our time those which in Lain, do call that fat Azungia, which encreaseth more solid between the skin and the flesh, in a Hog, a Man, a Brock or Badger, a Dor-mouse, a Mountain-mouse, and

The fat of Swine they commonly call Lard which groweth betwist the skin and the fiethin expressing the vertues of this, we will first of all shew how it is to be applyed to cures outwardly, and then how it is to be received inwardly; next unto Butter, it hath the chiefest commendation ons among the antients, and therefore they invented to keep it long, which they did by calling fome falt among it, neither is the reason of the force of it obscure or uncertain, for as it seedeth upon many wholesome herbs which are medicinable, so doth it yeeld from them many vertuous operations; and besides the physick of it, it was a custom for new marryed wives when they first of all entred into their husbands house, to anoint the posts thereof with Swine grafe in token of their fruitfulness while they were alive, and remainder of their good works when they

The Apothecaries for preparation of certain Oyntments, do geld a male fucking big, especially fuch a one as is red, and take from his reins or belly certain fat, which the Gorman call sebinar, and the French, Oing, that is, Unguennum: the husbandmen use Swines grease to anoint the axie trees of their Carts and carriages, and for want thereof they take putrified Butter, and in some Countries the gam that runneth out of Pine trees, and Fir trees, with the frum of Butter mingled together and this composition taketh away scabs and etters in Men: but it is to be remembred that this great must be fruste and and first composition taketh away scabs and tetters in Men: but it is to be remembred that this great must be fruste and and first contains the state of the contains t must be fresh, and not salted, for of salt grease there is no use, but to skowre those things that at

The antients deemed that this is the best Grease which was taken from the reins of the log washed in rain water, the veins being pulled out of it, and afterwards boyled in a new earthen poly and fo preserved. The fat of Swine is not so hot and dry as the fat of other beasts, the chief of of it is to moisten, to fasten, to purge, and to scatter, and herein it is most excellent when it has been washed in Wine, for the state salt grease so mixed with Wine, is profitable to anoint the

that have the Plutifle and mingled with after and Pitch, eafeth inflammations, filtulaes. and tuthat have and the fame virtue is afcribed to the fat of Foxes, except that their fat is hotter then the more, and lesse mother likewise ashes of Vines mingled with stale grease of Hogs, cureth the wounds of Scorpions and Dogs, and with the spume of Nitre, it hath the same vertue against the binite of Dogo. It is used also against the French disease (called the French pox) for they say if the bings of a Man be and inted therewith, and he stand gaping over it, it will draw a filthy matter out of his flomach, and make him vomit.

of the serents it is prescribed, to be anointed upon the knees, against the stifness of the Neck. Mingand walt Quickfilver and Brimstone, it is foverain against the itch and scabs. This Lard being fod with the fact, and applyed to the body, doth mightily expell corruptions that cleave to the skin. The fac of Swine with Butter and Oyl of Roses, is instilled into the broken skins of the brain for the

Likewife Bugloffe plucked up by the root, and the roots cut off, and curioufly washed, beaten and pounded into a Ball, and mixed with Swines greafe, is good to be laid to any incurable wound. It is also profiteble for the wounded Nerves of the body, beaten together with Wormes of the earth according to these Verses of Serenue : in creffed by

> Terra lumbricos indere tritos. Quen vetus & tanis sociari axungia debet.

When bones are broke i, if they be anointed with the fod greafe of Swine, and fo bound up falt together, after they be well fet and closed, grow wonderful falt, fure and folid again; Serens writeth thus of it;

> Si cui forte lapis teneros violaverit artus, Nette adipes vetulos, O tritum chamaciffon.

By the fat (he meaneth the fat of Swine) because presently after he maketh mention of the dung of Swine to be good for the same cure. Being mingled with P.tch, it scattereth all bunches and fellons. The hardness of the brests, Ruptures, Convulsions and Cramps, and with white Hellibor, it closeth wo cliffs and chinks in the flesh, and maketh the hard skin to be fort again. It is very profitable against inflamations of Ulcers, especially the fat of the Boar Pig, mixed with liquid gum,

Women do also use the fat of a Sow that never bore Pig to cleare their skin, and to mix it will Pitch, and one third part of Asses grease against the scabs. The same mixed with white Lead, and the spume of silver maketh the scars of the body to be of the same colour with the residue; and with Sulphur, it taketh away the spots in the Nails, mingled with the powder of Acorns : if the grease be salt, it softneth the hardness of the flesh. Rue mixed with Swines sewet or Buls grease, taketh away spots and freckles out of the face, and it is also profitable against the Kings evill, being mixed with the powder of a Sea Oy ster shell, and being anointed in a Bath, it taketh away the itch andblifters. Featherfew and stale Swines grease, is also prescribed against the Kings evill. This ame alone or with Snow, easeth the pain of burnings in the flesh, and when there is an Ulcer, by reason of the burning, mix it with toasted Barly, and the white of an Egge, according to these Verses:

> -Combustis igni, Hordea vel fruges, atq: ovi candida junges, Adfit adeps porce (mira est nam forma medele) Junge chelidonias, ac fic line vulnera fuccis, Quoda; recens uffit clacies, axuncia simplex Mulcet. & ex facili grata est medicamine cura.

Fresh greafe is very profitable for those members that are surboted or riven of their skin, and likewise to anoint them that are weary with long journies. The ashes of womens hair burned in a shell, and mingled with the fat of Swine, are said to ease the pain of St. Antonies fire, and to stanch bloud, and to cure Ring-worms.

The gall of a Swine, or of a Boar, and the Lights with the fat, filleth up the Kibes; and the stalks of Cabiges with the roots burned, and mingled with Swines grease being applyed to the fides, do cure the dayly pains thereof. And thus far of the use of this greate for the

Now also it followeth in a word to touch the use thereof for the bodies of Beasts. When the horns of Oxen or Kine are broken, they take a little Lint, Salt, Vinegar, and Oyl, and lay them upon the broken horn, powring in the liquid, and binding the reft close on the outside, and this they renew three dayes to gether; the fourth day they take the like quantity of Swines greafe, and liquid Pitch, and with a smooth rind or batk of pine they bind it to close, and so it is fastened again. When the hoof or anchies of an Ox are hurt with the plough fhare, then take hard Pitch, Swines greafe and Sulphur, roul them up all together in unwashed wool, and with hot burning Iron melt them upon the wound or horn.

The ears of Dogs in the Summer time are exulcerated by files, into the which force it is good to inftill liquid Pitch fod with Swines greafe, and this medicine also is negood to deliver Beafs from the tickes, for they fall off as many as touch it. When Lambs or Kids are troubled with the Sheep pox, fome use to anoint them with Swines grease and the rust of Iron, that is two parts of Sheep pox, tome the continuous and for warm them together. Also for the seas apon been seen and one part of rust, and so warm them together. Also for the seas apon been heels, that are called the scratches, which come for the most part in the Winter times they are them on this manner; They take the fat of Swine, and melt it on the fire, and pour it into told in them on this manner. They take it out and beat it well together, at last they mingle it with their ter, which afterwards they take it out and beat it well together, at last they mingle it with the stone beaten small, and so anoint the place therewith three days together, and the third day they open the scabs, and so continue anointing till it be cured.

When a Horse cannot hold his Neck right, it is good to anoint him with Oyl, Wine Hony and

Hogs-greafe; the manner of some Leeches is, when they have made a suppuration by Grania bur. ning, they first of all wash it with stale Urine, and afterwards mingle an equal quantity of aich and Hogs grease together, wherewithal they anoint and cure the fore:

Sometime the bloud of Oxen falleth down into their feet, wherein it congealeth and breakth forth into scabs, then must the place first of all be scraped with a knife, and the scabs cut away, afterwards with cloaths wet in Vinegar, Salt, and Oyl, moistened and pressed hard, and lest of all by an equal quantity of Hogs greafe, and Goats sewet sod both together, it will be cuted by laving it unto it. And thus much for the remedies of Swines greafe towards Beafts. The huster of Beans being beaten small to powder, and mixed with Swines grease, is very profitable against the pain of the hips and the nerves.

Some Phylitians take the grease of Swine, the fat of Geese, the sewet of Buls, and the Octom or sweat of Sheep, and anoint therewithal Gowty legs, but if the pain remove not, then do they add unto it Wax, Mirtle, Gum and Pitch, and some use it mixed with old Oyl, with the stone Sat. cophagy, Cinck-foyl beaten in Wine with Lime or aftes. This Swines greafe beaten in water with Cumin, is prescribed by Simeon Lethi against the Gowt. It remedieth the falling of the hair and the pain in the heads of Women, mingled with one fourth part of gals, and the like virtue it hath with wilde Roses, Lingulacu and Hippocampinus with Nitre and Vinegar. When the corners of ones eves are troubled with Worms, by anointing them with the fat of a Sow with Pig, beating them together both within and without, you shall draw all the Wormes out of his eyes.

When one hath pain in his ears whereby matter issueth forth, let him beat the oldest Lurd he can in a Morter, and rake the juyce thereof in fine wool, then let him put that wool into his ear, making it to work through warm water, and then infuse a little more of the juyce of that Lard and fo shall he work a great cure in short time. And generally the fat of Geele, Hens, Swine, and Fores. are prepared for all the pains in the ears.

If there arise any bunch in the neck or throat, seethe Lard and Wine together, and so by gargarifing that Liquor, it shall be dispersed, according to the Verses of Serenus;

> ----In rigore Cervicis geminus mulcebitur unguine poples, Hino longam pariter nervos medicina fequetur.

And it is no marvel that the vertue of this should go from the knees to the Nerves, seeing that Pliny affirmeth, that from the anointing of the knees the favour goeth into the stomach: there is to great affinity or operation of Rue upon the stones, that in antient time they were wont to cure burlings by anointing the Cods with wilde Rue and Swines greafe.

Also this Grease with rust of Iron, is good against all the impersections in the seat. Butter, Goose grease, and Hogs grease, are indifferently used for this infirmity. Also this is used to keep Women from abortments that are subject thereunto, being applyed like an eye salve. In the diseases of the Matrix, especially Ulcers, they first of all dip Spunges or Wool in warm water, and sociense the places infected, and afterwards cure it with Rozen and Swines greafe mingled together, and often using it in the day and night by way of Oyntment; but if the exulceration be vehement, after the washing they put Hony unto the former consection, and some make a persume with Goats Horn, Gals, Swines grease, and Gum of Cedars. And. Fernerius saith, that Lard cut small and beat in a Morter of Itone like paste, in a Limbeck of Glasse, rendereth a white water, which maketh the hair yellow, and also the face comely. If a man be poysoned with Hemlock, he cannot avoid it better, then by drinking Salt, Wine, and fresh Grease. A decoction hereof is good against the poyson of Bouprestin, and against Quicksilver. The sewet of a Sow sed with green Herbs, is profitable to them that are sick of a consumption of the Lungs, according to this Verse of Serenus:

Proderit & veterie fevi pila sumpta suilli.

This may also be given them in Wise, either raw or decocted, or else in pils to be swallowed down whole if it be not falted, and the fift day after they prescribe them to drink out of an Eggeshell Liquid Pitch, binding their sides, breast, and shoulder bones very hard. It is also used for an old Cough after it is decocted, the weight of a Groat being put into three cups of Wine with some Hony. It is given also to them that have the flux, especially old Lard, Hony, and Wine, being bester

together till they be all as thick as hony, whereof the quantity of a Hafil-nut, is to be drunk together cill they he all a torce as mony, whereouthe quantity of a Hasil-nut, is to be drunk out of Water. Also months on Swines greate, Butter, and Hony, being put down into a Horse throat, cureth him of an old Cough; and finally a piece of this Greate being old, moistened in old Water, is profitable to a Horse that been overheated in his journey. When Calves be troubled with belly. Wormes, take one part of Swines greate; and mingle it with three part of Hylop, assessands thrustoir down into the throats of the Calves, and it shall expell the Wormes. the Wormes. Stage and chaps wax black by a peculiar fickness of the mouth, which the Physicians

call Mother Epidemin, it is most wholesome to rub the tongue with the inner side of the rines of Bacon, and fo draw sout an extreme heat : and it is faid if a man be deeply infected, whose tongue is thus rubbed a the faid Bacon rine being eaten by any Dog, will procure his death. The fat of Wolves and the marrow of Swine is good to anoint blear-eyes withal. By swallowing down the marrow of Swine, the appetite to carnal copulation is encreased.

The ashes or powder of Hogs bristles which are taken out of Plaisterers Pencils, wherewithat they rub wals, and mixed with Swines grease, doth ease the pain of burnings, and also stayeth the bleeding of wounds, and the falling down of the feat being first of all washed in Wine and dryed Pitch mingled therewithal. The powder of the check-bones of Swine, is a most present remedy for broken bones, and also for ulcers in the legs and thins. The fat of a Boar is commended against Scroents, and so also is the liver of a Bore Pig when the Fibres are taken from it, if the weight of two pence be drunk in wine.

The brain of a Sow toasted at the fire, and laid to a Carbuncle, either disperseth or emptieth it. Likewise the bloud and brains of a Boar or a Sow, or Boar Pig being mixed with Hony, doth cure the Carbuncles in the yard, and the brains alone, openeth the gums of children, to let out their teeth, as Serenw writeth ; Section Committee

Aut tenerit cerebrum gingivie illine poroi.

There are naturally in the head of a Hog two little bones that have holes in them, one in the right part, and another in the left. Now if it happen that a man finde these bones by chance, either one or both of them, let him lay them up fafe, and whenfoever he is troubled with the Head-ach, let him use them, hanging them about his neck by a filken threed, that is to say, if thehead ach on the right fide, let him hang the right bone; and if on the left, the left bone; Thefe things I report uoon the credit of Marcellus. Galen also writeth, that if the pole of the Swines ear be hanged about onesneck, it will preserve him from all Cough afterwards.

They were wont, as Dioscorides writeth, to seethe a Gudgen in a Swines belly, by the eating whereof they flayed the falling down of the feat. If a man eat the lungs of a Boar, and a fow fodden and falling, they will preserve him from drunkenness all that day; and likewise the faid lungs doth keep the soles of the feet from inflamation which are caused by straight shooes. It also healeth the piles, clifts, and breaking of the skin, and kibes of the feet, by laying to it a Boars gall, and a Swines lungs.

If a Man drink the Liver of a Sow in Wine, it faveth his life from the bitings of venemous beafts. Aliothe liver of a Boar burned with Juniper-wood, cureth all the faults in the fecrets; and drunk in Wine without Salt after it is fod, ftayeth the loofeness of the belly. The gall of Swine is not very vehement, for as the whole body is waterish, so also is that; neither is there any beast herein comparable unto it, (except the wilde) and that is enemy to Ulcers, ripening the fore, scattering the evill humors, and resisting the bitings of venemous Beasts. Also the gall of Boars layed to brussed Articles, doth procure unto them wonderful ease. One shall take away an old scurse very easily by the gall of a Sow, which farrow if it be mingled with the juyce of the hearb Siclamine, and therewithal to rub the head well in a Bath, To keep hair from growing upon the browes when it is once plucked off; Take the gall and fat of a Boar, and put them into a smooth thick earthen pot, and of the sharpest Vinegar and oyl of Almonds four ounces a piece, pour that into it, and then binde the mouth of the pot close with a thick linnen cloth, so letting them stand seven dayes together, afterwards open them again, and you shall findeupon the top a certain scum like gold, wherewithal anoint those places, which you would have remain bald, after that you have beaten it together in a morter : likewise the gall of a Barrow Hog or Boar Pig, doth scatter Apostumes and bunches in any part of the body. The gall of a Hog dryed in an Oven, and laid upona Carbuncle, as much as will cover it, it cleaveth fast to the fore, and draweth out the root

It is likewise good against the Uicers of the ears, except the Uicer be of long continuance, and thenitis good to use a sharper gall, such as is a Sheeps, an Oxes, a Bears or a Goats, they mingle herewithal fometimes oyl of Rofes; but for old wounds in the ears, it is good to take one part of best Hony, and two parts of the sharpest Vinegar, and so let them boyl on the fire three walmes, asterwards set them far off from the fire, until it leave seething or boyling, and then put Nitre unto it, so long till you know by the Vapor that the Nitre is setled, then seethe it again upon a sentle fire so as it housest be until the vapor that the Nitre is setled, then see the gain upon a gentle fire, fo as it boyleth not over, and laftly put into this the gall of a Boar, or of a Goat, and then kethe it the third time, taking it from the fire, when it is luke-warm, infuse it into the ears, and this gal must not be the gall of a Sow, except of such as never bare Pig. Also this gall being dried

dothcure the Hemorrhoids and kibes. There dreatio certain flifters or clifts in the hoofs of Points, which are cured in one nights space, by applying tinto them the gall of a Barrow flog; inhighed with

which are cured industrial by the policy of the policy of

They were wont to give the stones of Swine against the Falling lickness; but when they were first dryed, and afterwards beaten to powder, and given to the fick party in Swines milk to be was commanded to abstain from wine many dayes before, and after he received it for many dayes together. It a says they take the stones out of a young Hog when they geld him, and work together. It a says they take the stones out of a young Hog when they geld him, and work together the fire so long, till they may be crushed to pieces, and this they prescribe to be days in

Wine against the Colick.

Some give the powder of Boars stones to men and women to increase copulation and conception. The Magiciam or wisemen of the East prescribed to be drunk for the incontinency of ception. The Magiciam or wisemen out of sweet wine, and then to make water in a Dogs urine, the powder of a Boar Pigs stones out of sweet wine, and then to make water in a Dogs urine, the powder of a Boar Pigs stones and two the be Englished. Some take the bladder of a cabile: but I will leave this superstition as not worthy to be Englished. Some take the bladder of a cabile: but I will leave this superstition as not worthy and some a certain siquorish poyson, which sow burned to powder, and drunk for this infirmity, and some a certain siquorish poyson, which droppeth from the Navel of a Boar Pig, immediately after it is farrowed.

Bacon beaten together, and made like meal, is good againt a continual Couph, or stayeth bleed.

Bacon beaten together, and made like meal, is good againt a continual Couph, or stayeth bleed ing at the mouth. Bacon to scatter gravelly matter in the bladder. The bones of Biconabour make an emplaister of Bacon to scatter gravelly matter in the bladder. The bones of Biconabour make an emplaister of Bacon to scatter gravelly matter in the bladder. The bones of Biconabour make an emplaister of lacentees and rub teeth, and by burning of them, not only the looseteeth mean the hips are kept to clense and rub teeth of beaths are killed. It a Horse be troubled with the are saftened, but also the wormes in the teeth of beaths are killed. It a Horse beath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, then let the broath where Glanders or any such liquid matter running out at his mouth and nose, the look liquid matter running out at his mouth and nose, the look liquid matter running of the liquid matter running of the liquid matter running of the liquid

finews.

The ancie bone of a Sow being burned untill it be white, and bruifed and taken indink, doth cure the swellings of the neck, and pains of long continuance. The ancie bone of a Sow burned and bruised, and given to drink only in Water, is a remedy against the Colick and some Theankle and bruised, and given to drink only in Water, is a remedy against the formach, and doth safe the pains bone of a Sow doth drive away those swellings which arise in the stomach, and doth safe the pains

of the head.

The ashes of the ancle bone of a Sow or Boar, doth cure Corns, clefts, or other rists in the skin, and the hardness of the skin that is in the bottom of the feet. It is also shewed, that if the bone shall be hung about the neck of those that are troubled with quartain agues, that then they bone shall be far better, but of what bone he speaketh, it is uncertain, but as he remembreth it is the next bone before the sat of the anckle bone.

The bones that are taken from the hoofs of Sowes, burned and beaten to powder, are very good to rub and clense the teeth: Also the bones next to the ribs of Bacon, being burned, are very good to fasten the teeth. The bones that are taken from the hoofs of hogs, and burned to powder, are used to clense the teeth, and it is very good also to fasten the teeth. The asherwhich are used of a Harts horne, or of the hoof of a Hog, are very good to clense or rub the teeth. The made of a Harts horne, or of the hoof of a hog burned and beaten to powder and sisted. The bones which are taken from the hoof of a hog burned and beaten to powder and sisted, and a listed bones which are taken from the hoof of a hog burned and beaten to powder and sisted, and a listed beat and added thereto, doth make the teeth very white, by often rubbing them therewith. The ashes of the hoofs of a Boar or Sow, put in drink, doth stay the incontinency of Unine, and also the Bloudy slux. Take as much Mercurial sodden, as ones hand can hold, sod in two pintes of Water unto one pinte, and drink the same with Hony and Salt, and the powder of a Hogs hoof, and it shall loofe the belly.

and it shall loose the belly.

The milk of a Sow drunk with sweet Wine, helpeth women in travell; and the same being drunk alone restoreth milk in Womens brests; it is also good against the Bloudy slux and Tissick. The alone sof Swine beaten to powder, and drunk in Swines milk, are good against the Falling sides to the wise men were wont to prescribe the less foot or leg of a Camalion to be bound unto the foot grainst the Government.

the feet against the Gowt.

There are also many uses of the dung of Swine, and first of all it being mixed with Vinegar, is good against the bitings of venemous beasts, and Aeriss maketh an Emplaister thereof, against the biting of a Crocodile. It is to be applyed single against the stinging of Scorpions, and also the biting of a Crocodile.

biting of any other reptile creature. If a Serpent bite an Oxe or a Horfe, or any other Four-footed Beaft, take the stalk of Nigella, and beat it into a pinte of old wine, so as all the juyce may go out thereof, then infuse it into the Nostrils of the Beast, and lay Swines dung to the fore, so also it may be applyed unto men, whereunto some do add Hony Attick, and the Urine of a man, and so It is to be applyed warm, it being also warmed in a shell, and dryed to powder, mixed with Oyl, and layed to the body, easeth outward pains. It is likewise prostable against burnings, itch, scabs, and biliters, and trembling of the body, according to these Verses of Serense;

Stercoris ex porco cinerem confundito lymphis i Sic pavidum corpus, dextra pascente soveto.

This is also commended against hard bunches in the body, hardness of the skin, clifts and chinks in the fielh, freekles, lice, and nits, and also the breaking of the finews;

Si cui forte lapu teneros violaverit artus, Non pudeat lutea stercus producere porca.

It is also good to stay bleedings at the Nose, if it be layed to the Nostrils warm, and to stay the bleedings of Beasts, if it be given them in Wine; the same being mixed and covered with Hony, is anointed upon Horses for the Quinsie, or swellings of the throat. If the breasts of a Woman do swell after her delivery of childe, it is good to anoint them with water, and the dung of Hogs, also the powder thereof mixed with Oyl, is prositable for the secrets of men and women. If a man have received any hurt by bruises, so as his bloud stayeth in his body, or suffer Convulsion of the Nerves through Cramps, those evils are cured by the dung of a Boar gathered in the Spring time, dryed and fod in Vinegar, and some of the later Physitians prescribe it to be drunk in Water, and they say that Nero the Emperor was wont to use that medicine, when he would try the strength of his body, in a running Chariot: also the powder of the same being drunk in Vinegar, is prositable for the Rupture and inward bruises, and warmed in Wine against all manner of sluxes and Issaes. For the pains of the Loins and all other things which need mollifying, rub them sirth of sall with Deers grease, and then sprinkle them with old Wine mixed with the powder of Swines dung.

The Urine of a Swine is also good against all bunches and Apostemations being layed to in wool. The urine of a Boar Pig dryed in the smoak, and drunk with sweet Wine, the quantity of a Bean, is profitable against the Falling evill; against the whiteness of the eyes, and the stone in the reins and bladder. And thus much of the Swine in general.

Of the Wilde BOAR.

This Beast is termed by no other name then the common Swine among the Hebrews, namely, Chajir, as you may see in Plat 80, where the Prophet speaketh of Chasir de silva; that is, the Boar out of the wood. The Greeians call him Capros and Syagros, and Clunie, although some take Clunie for a Boar of an exceeding great stature. Aristophone saith, that there are some of this kinde

The Epithets.

Of the Smine.

which are called Monit, which word by St. Cyril upon the Prophet Hofes is interpreted a wilde Affe which are caused month, which word by that Chlunis, Monior, and Chauliodon are Poetical words but I rather incline to their opinion which fay, that Chlunis, Monior, and Chauliodon are Poetical words for cruell Boars. Arifotle is of opinion, these Boars being gelt when they are young, grow grener and more fierce, whereunto Homer also yeeldeth as he is thus translated.

Nutriit exetum sylvis borrentibus aprum Inftar non brutt, (ed dorft mont is opaci.

But this is to be understood of such Boars, as by accident geld themselves by rubbing upon any tree. But this is to be understood of fucil Doars, as by actioning generally troubing upon any tree. The French call this Beast, Sanglier and Porco Sanglier; the Italiane, Cingbiale and Cingbiare, and Porco. The Spaniards, Puerco Sylvestre, and Puecco montes, and Javali; the Germans, Wild Schwein; the Ilynians Wepra; and the Latins, Aper; for Porces fignifieth the tame Swine, and Aper the wilde. The reason of this Latin name oper, is derived from Afper, because he liveth among the sharp thorns and woods. but I rather think, that Aper is derived from Capres the Greek word, or else Aper a feritate, from fierce ness and wildeness, by changing one letter into another.

The Epithets of this Beaft are many, both in Greek and Latin, such as these are; sharp, wilde. Arcadian, Atalantean, troubler, bloudy, toothered, hard, Erymanthean, cruell, outragious, fierce frong, gnafhing, lightning, yellow, raging, Acorn-gatherer, quick, rough, rough-haired, homble Menalian, Misan, Meleagrean, threatning, woodwanderer, cruel, Sabelican, briftle bearer, foaming, find filthy, Tegean, Thusean, fearful, wry-faced, truculent, devourer, violent, Umbrian, wound-maker im. petuous, mountain-liver, armed on both fides, and fuch like

But of these Epithets there are only three, Erymanibean, Calydonian, and Mysian, which do offer unto us peculiar stories, according as we finde them in the Poets, which we will prefix by way of moral discourse before we enter into the natural story of this beast. First of all, Erymanibu was a hill of Arcadia, wherein was a wilde Boar, that continually did descend down and depopulate their Corn-fields; Hercules coming that way, and hearing of that mischief, did kill the said Boar, and carrved him upon his back to Eurysthem, whereat Eurysthem was fo much afraid, that he went and hid himself in a brazen vessell, whereof Virgil speaketh thus:

Placarit fylvam, & Lernam tremefecerit arcu.

And of this Erymanthean Boar Martial Speaketh :

Quantus erat Calydon, aut Erymanthe tuus.

Of the Calydonian Boar there is this story in Homer; When Oeneus the Prince of Etolia sacisfied the first fruits of his Countrey to the Gods, he forgot Diana, wherewithal she was very angry, and fent among the people as favage Boar, which destroyed both the Countrey and Inhabitants : against whom the Calydonians and Pleuronians went forth in hunting, and first of all that wounded the wilde Beast was Meleager, the son of Oeneus; for reward whereof, he received his head and his skin, which he bestowed on Atalanta a Virgin of Arcadia, with whom he was in love, and which did accompany him in hunting: wherewithal the fons of Theflim', which were the Ulefee of Milinger, were greatly offended (for they were the brothers to his mother Althea) those men lay in wait to destroy him, whereof when he was advertised, he killed some of them, and put the residue to fight. For which cause the Pleuronians made war against the Galydonians: in the beginning of which war Milasger fell out with his Mother, because she did not help her Countrey. At last when the City was almost taken, by the perswasion of his wife Cleopatra, he went out to fight with his enemies, where in valiant manner he flew many of them, others he put to flight, who in ther chafe running away, fell down upon steep rocks and perished. Then Alibea the mother of Meleager, began to rage against her fon, and flung into the fire the torch which the Fates had given unto her to lengthen his dayes; fo when the faw her fon was dead, the repented and flew her felf, and afterwards was call into the very felf fame burning fire with him. In the hunting of this Boar Ancaus the companion of Jason to Colchie was flain. This Boar is also called a Meliegran and Atalantas Boar, of whom Martial writeth thus :

> Qui Diomedeis metuendus Setiger agris Ætola cecidit cuspide, talis erat.

And again in another place;

Latte mero pastum pigra mihi mortie alumnum Ponat, & Ætolo de sue dives edat.

It is said that this Boar had teeth of a cubit long, and the manner of his hunting was expressed the pinnacle of the Temple of Tegea, for which caufe he is called the Tegean Boar. Upon the of fide of the Boar against his middle, were painted Atalanta, Meleager, These word Islamon, Peless, Polis, and Islamon and Islam and lolain the companion of all Hercules travails. Prothin and Cometes, the fons of Thiefin and brethen

of Albee, on the other fide of the Boar flood Ancau wounded, and Epochus fultaining his hunting foear; next unto him food Caller and Amphiarem, the fon of Oiclem. After them Hippothus, the fon of Cercion, Agemedes the fon of Stymphelus, and lattly Pyrisbous. The teeth of this Boar were taken of Lereinn, by Augustus after the time that he had overcome Anthony, which he hung up in the Temple of Bacchur, standing in the Gardens of the Emperor. And thus much for the Cali-

Now concerning the Mysian Boar, I finde this flory recorded of him; When Adrastus the Phreian, who was of the Kings bloud, had unawares killed his brother, he fled to Sardis, and after his expiation dwelt with Cresus. It happened at that time that there was a wilde Boar came out of Oliment, and wasted a great part of the Countrey of Mysia: the people oppressed with many losses and terrifyed with the presence of such a Beast, besought the King to send his own Son Atter with much company to hunt and kill the Boar. The King was affraid thereof, because in his dream he saw a villon, his Son perishing by an iron spear; yet at last he was perswaded, and committed the safegard of his body to Adrastus. When they came to the wilde Beast, Adrastus bent his spear at the Roar, and while he cast it to kill him, the fon of Crefus came betwirt them, and so was flain with the focar, according to the dream of his Father. Adrafius feeing this misfortune (that his hands which hould have defended the young Prince, had taken away his life) fell into extreme passion and forrow for the same, and although the King knowing his innocency, forgave him the fact. vet he slew himself at the Funeral of Auys, and so was burned with him in the same fire. And thus much for the Milian Boar.

Now we will proceed to the particular story of the wilde Boar, and first of all of the Countries breeding Boars. The Spaniards say, that in the new found world, there are wilde Boares much lesse Of the wilde thenours, which bave tails fo thort, that one would think they had been cut off, they differ alfo in Boars parts their feet, for their hinder feet are not cloven, but fland upon one claw, and their forefeet are and other accicloven like common Swines. Their flesh also is more sweet and wholesome then common Swines dente. flesh, whereof Peter Martyr giveth reason in his Ocean Decads, because they feed under Palm trees, neer the Sea-shore, and in Marshes.

Olaus Magnus writeth, that in divers places of Saudinavia, they hunt wilde Boars which are twelve foot long. The wilde Boars of India according to Pliny have teeth, which in their compass contain a Cubit, and besides their teeth growing out of their chaps, they have two horns on their head like Calveshorns. In the Islands Medera, there are abundance of wilde Boars, likewise in Helvetia, and especially in those parts that joyn upon the Alpa, where they would much more abound, but that the Maguitrates give liberty to every man to kill and destroy them. There are no Boars in Africa, except in Ethiopia, where their Boars have all borns, and of those it was that Lyongs the Countryman faw in a publick spectacle at Rome:

Et niveos lepores, & non fine cornibus apros.

that is, Hares white like Swine, and Boars that have hotes. It is a wonderful thing that there are no Boars in Creet, and no leffe admirable that the Boars of Macedonia are dum and have no voice. and thus much concerning the Countries of Boars.

Now concerning their Colour, it is observed, that wilde Boars for the most part are of a black and brown colour, especially at the top of their hair, and somewhat yellow underneath, and yet Pausanies writeth, that he hath feen Boars all white; howbeit that is not ordinary. Their bloud is sharp and black like black wine, and fuch as will never be thick, their eyes like to the eyes of wrathful beafts. as Wolves and Lyons. Their tuskes are most admirable, for with them while they are alive, they cut like tharp knives, but when they are dead, they have lost that cutting property, the reason of it is in the hear of the tooth for it is certainly affirmed by Hunters of wilde Boars that when the Beaft falleth Orpignus. first on the earth down before the Dogs and Munters, if one pull off a briftle from his back, and Gillim. lay it upon the tusks, the heat thereof will make it thrink up and turn together, like a hot Iron, and if Dogs do change to bouch them, they burn their hairs from their back, whereby the ardent and fiery nature of this beaft is manifelt, as an evenlefting monument of the work of God, and yet notwithflanding all their wrath shey have no gall, (as Pliny writeth) their head and face are their frongest parts, and therefore upon them they receive the Hunters blowes as upon a bucket.

Their tears which they lend jorth of their eyes are very livest, and of all paher things they cannot abide their own prine, for it is thought to be to bot that is burneth them, and they can never run away in flight till they have emptyed their bellies chereof. The place of their abode is for The places of the most part in the Marthes and Woods: for the Sorbian didhunt Harrand wilde Boars in the their abode. Marines, but Roes and wilde Affes in the plain fields. Sometimes they hide themselves among Fern, which they have gathered together in the fields, and they dig holes and dirches for themfelves, wherein they reft : And this is observed that shey love not to much so mallow in the mire, as the tame and domesticall Swines, although they be of a hox and firry nature. Their voice is like the voice of common Swine, but the females is somewhat more thrill. They livedor the most part folitary and alone, and not in heards as the other do, sand feed upon such meats as the vulgar Swine. Tragus faith, that there is a kinde of gegen Corn in Garnany, which is armed with very harp stalks and points at both ends like Barley, this the people do feethe and earlike peafe.

Now forasmuch as wilde Boars are destroyers of their Corn, they sow that grain need the

woods fides where the Boars abide, whereby they defend and fafeguard their better Corn.

Bores do also eat the worms of the earth, which they dig out with their noses; and in Pampbille and

the mountains of Gilleia, they do eat Salamanders without hurt or danger to themselves, and the mountains or chief, they do to vanish have so devoured them, they die afterwards through yet it men chance to eat of their helit which that there is danger in eating wilde Hogs flesh the poylon: whereby it maintenly appearance, which they never eat but unawares, and having eaten it, presently they lose their strength in their hinder parts, whereby they are faintodraw

eaten it, presently they for manner they crawl to the water fides, where they gather toge. them after them, and in that manner whereof they are restored to their former health. Ity is ther Snais and Sea-traus, by satisfy and old age maketh them altogether unfit to be prefer-

in the constant of the control of th

The generatian of wilde Swine.

Boars past four year old, because after that time they waxed lean and pined away. Dars pail four year old, securities or copulation to engender, it is certain that they do not Now concerning their general Swine, but only once, and that in the beginning of Winter, or the middle, so that they may bring forth in the Spring time of the year; and they choose the or the miled, narrow, hollow, and steep places to couple in. The male abideth with the semale thirty dayes together, and the female beareth her young ones, both for the number and the time answerable to the vulgar Swine. When the Boar is in copulation before-hand, while he worker the Sow, he carrieth a mouth as white as any Horse, which as in the Horse it riseth through vehement stirring, so in the Boar it riseth through vehement heat and servor. In the time of their nement titting, to the caser, and cruell, fighting with all males that come in their prefence. and therefore they arm their bodies by rowling in the durt, and also by rubbing them against trees, that so they may be hard to withstand one another. This fight of Boars is thus described of Virgil !

> Per filvas tum savus Aper, tum pesima Tigris, Ipfe ruit dentefque (abelliene exacuit Sm. Et pedibus subigit terram, fricat arbore coftus, Aig; binc aig; illinc bumeros ad vulnera durat.

The fight of Being inflamed with venereal rage, he so setteth upright the bristles of his neck, that you would boars.

Boars. Being inflamed with venereal rage, he so setteth upright the bristles of his neck, that you would be take them to be the sharp fins of Dolphins; then champeth he with his mouth, gratesh and anasheth his teeth one against another, and breathing forth his boyling spirit, not only the eyes, but at his foaming white mouth, he defireth nothing but copulation, and if his femiliendure him quietly, then doth the fatisfie his luft, and kill all his anger; but if the refuse, then doth he either constrain her against her will, or else layeth her dead upon the earth. Sometime they force a tame Sow, and then the Pigs so begotten are called Hibride, that is, by way of contonely, Bastards : And it is to be observed, that never any wilde beast being tamed, doth engender bycopelation, except they be tamed very young, only wilde Boars do quickly mingle with vulgar swine.

The female of this kinde hath no teeth standing out of her mouth like the male, except very flort ones, and therefore the refidue are more like a faw then the teeth of a Boar, for it is a general rule;

Nulli dentes exerti quibus ferrati.

Concerning the disposition of Boars in generall, it is brutish, stubborn, and yet couragons wrathfull, and furious, because their blood is full of fibres, and ministreth unto them sudden matter of anger; neither are there any beafts so cloathed with hair as Lions and Boars; wherefore both of them are of like flerce and angry nature, yet we have shewed in the story of the Hart, how they were drawn from their meat and dens by the voice of Musick. It is said, that they at not capable of any discipline or instruction, and yet Scaliger affirmeth, that he faw a Borethal belonged to the Lord of Salvimont, of an exceeding great stature, tamed by his master, who at the founding of the horns, would come running like a Dog to hunting, and go abroad with himaster among the Dogs, contending with the most swift in race to attain the prey.

They naturally defire to bury their own footsteps in wet miery places, that they may not be found out by the Hunters; and as the rage of the Boars is greatest in the time of their luft, fo is his the Sowes after their farrowing; and therefore it was an excellent speech of Grander unto C) that Swine when they see the Hunter, although they be many, yet run away with their pigs; but if the Hunter follow one of the young ones, then doth the Dam turn again, and with all her force endeavour to destroy him that would deprive her of her young ones. Before the Boars do fight, they go and whet their teeth, but while they are in contention; if it happen that a Wolf content in fight, then they for fake their mutuall combats, and all of them joyn together to drive away the Wolf. The Beare dareth not to enter upon the wilde Boar, except behinde him, and unaware, Heffod faith, that Vulor pictured upon the filed of Hercules, the images and shapes of many will beafts fighting one with another, neither of both yeelding to other; till both of them fell down ded, which caused Aloisem to make this Emblem of a Vulture standing by to see their contention,

and the state of t like Wolves, and many times in flogies and heards like Roes; for fuelt is their ardent nature and Boars. heles of meets this other fear not the highest Mountains, now the deepest waters. Now concerthe flesh of wilde Boars, although we have spoken abundantly in the former discourse of sing me nemotive adde fomething in this place; for although generally the flesh of teme fivine is vikous and cold, were the flesh of the wilde is more temperate and nourishable, and therefore of Habter concoction and dronger nouriffmenty. Therefore whole which had a Timpany were seeferibed to ear Boars flefth and wilde Sowes, feir it drieth, firengthneth, and moveth; and men hardes vexed with Saint Anthonies fire, are forbidden to cat all falt meats, and leavened bread. recommitted to eat of Boars fielh. It is reported, that Publius Servillus Rullus, was the very first among all the Ramoneichat did fet at his Table a whole Boar, most delicately dreffed and stuffed with variety of divers costly diffies; which Bear by Varro is called Aper Millianius, that is, Mille bleaun, of a thousand pound worth; against which intolerable gluttony and cost, suvenel made thefe Verfes :

Quanta oft gula que fibi wtos the indicate and a strange Ponit Apres, animal proprer convivia netum.

Some in the beginning of his eight book, prescribeth the manner how to dresse the steff of wilde Boars, wherewithall if any be delighted, let him read that book; for it is not my purpofe in this Treatile, to blot day paper with any long inftruction for Cooks and Bellv-gods, neither were it any part of this naturall History; nor yet agreeable to my calling or enterprise : and therefore I will only adde this observation of Misaidus, that Boars fielh salted in powdering tubs, doth change both colour and tafte, at that time of the year wherein the living Boars do rage upon their females: And thus much shall suffice to have spoken of Boars sieth.

Nowin the next place we will proceed to talk concerning the hunting of Boars, which is not Of the hunting only a patime for Lords and Princes; but also a necessary labour for meaner men's for as the of wilde Boars, brinthat cometh by Boars is exceeding great, and fo much the greater by how much he is poormint doth fultain 12/10, the utility to learn the means of defiroying this beaft is is more commodious, because the common proverbis more true in this then in the vulgar Swine, that they neverdo good till they are dead. would be to the same

It is reported of Disclettan, when he was Agent for the Romans in France, there came an old Woman called Dryss unto him, and reproved him for his coverousnesse, telling him that he was over sparing, and parsimonious; to whom he answered in jest, When I am Emperour I will be more liberall: Dryas replyed unto him, Noll jocare Divolettane, nam Imperator orle cime Apram occiderie. That is, Jeft not, O Diseletians for thou shaft be Emperour when thou haft killed aper; (that was a Boar as he thought) and therefore he gave himfelf to the hunting of Boars, never fouring any time that was offered unto him, alwayes expeding the event of that speech; whereof he was frustrated until he killed Arius Aper, the Governour of the Judgement Hall, and then afterwards being Emperour; he knew that the woman did not mean a Boar, but a man. Now therefore the hunting of Boars, and the manner of their taking is many wayes, either by violence in chafe, or by policy in diches and traps, or elfe by impoylohed baits. The best time of their hunting is in the middest of Winter, as some say ; but I think the Winter is the worst time, because then they are strongest, and feeing all Swine are impatient of heat, the Summer will quickly end their life; if then they be dafed. It behoveth therefore the Hunter of Boars to be very wary, and therefore the Ancients ordirect that fuch a one should wear a rough garment of a brown colour, and likewise that his Horse should be of a yellow and fiery colour, and that the Boar-spear should be strong and sharp, for this beaft is armed with a very strong head and skin, and besides they cover themselves with dried durities t were with a Coat of mate to blunt the weapon, and therefore he runneth willingly either without dread or fear upon the Munters. In which encounter if he receiverh not a deadly wound, he overthroweth his adversary except he fall flat on the ground; for the Boar's reeth cannor out upward, but downward ; therefore if the Hunter boa foot-man, to mult feat himfelf neer fome tree, and then alfo provide that if the mille the Boar, he may safily climb into the bought, and for ave himfelf; but if the Swine that is raised be a female, the will all to tear and bice the Hunter with her teesh if the get him within her clatches . wherefore, for the more speedy ending of the hanting is is good to mift the beaft early in the morning before he finth made water, for the burning of his bladder on quicky make him wearly. To diable, and a native of the liberty and reft in the chafe to easily the Boar have either made water before, or got liberty and reft in the chafe to easily home.

infelf, then will his taking be very difficult and tedious, such is the nature of this couragions but that he never ceafeth running till he be weary, and being wearied diffembleth the fame by

There is also another manner of hunting wilde Swine, which is this. First of all they fet up their

fitting upon his buttocks, and offereth combate to his Hunter, and yet he is not wont to brike a man, until he be wounded firth by him. When the Boar is first raised out of the Wood, he smitch in the winde, lifting up his nose to smell what is with him, and what is against him.

The hunting Spear must be very sharp and broad; branching forth into certain forks or home. I he nunting spear that be very many them upon the blinter, and when he bendeth the to as by no means the boar man tread with one leg before another like a Wrestier, holding his lest same before the beast, he must stand with one leg before another like a Wrestier, holding his lest hand upon the middle of the Spear to direct the fame, and the right hand behinde, to thrushir for. nand upon the middle of the open to distance on the beaft, and if it be a Boar to wound him in the ward with violence, having his eye intent upon the beaft, and if it be a Boar to wound him in the ward with violence, having his eye-lide, or elfe upon the shoulder, for in both those places the middle of his forehead betwixt his eye-lide, or elfe upon the shoulder, for in both those places the miscate orms foreness between the chance to hit him on the cheek, the greatest harm that he doth him, is wound is deadly; but if he chance to hit him on the cheek, the greatest harm that he doth him, is wound is deadily; but in the time to use his susks; of this lie must be very carefull that if the Boar lespup. on him, he likewise must give back and draw out his sword; and if he chance to be overturned, then to lye down in some hollow place where the Boar cannot come at him with his teeth.

Now concerning the instruction of Dogs; and the choice of fuch Hounds as are appointed for the hunting of Boars, you must note, that every Dog is not fit for the same, but great massives, the numing of Doars, you many of Bears. For the Boar first of all terrifieth the Dog with his voyce, such as are used for the baiting of Bears. and if he be not ready to fight but to run away, then are the Hunters in worse tale then at thebe. ginning. Therefore they must be sure to have them well instructed before they give the onset, and be likewise at hand to encourage them. When they come first of all to the place wherein they conjecture the Boar is lodged, if there be no appearance either by his footsteps, or by the wounds of his teeth upon the trees and boughs, then let them let loofe one of the best Hounds, and cashing about

the Wood, follow with the refidue whither the crie goeth.

The Dog presseth into the thickest bushes where commonly the Boar lodgeth, and when he hath found the beast he standeth still and bayeth, then must the Hunter come and takeup that Dog, for the Boar will not fir very eafily out of his lodging, and go and fet up his nets and toyls in all the by-places, whereby it is likely the beaft will paffe, and these must be hang to some trees, for postes in the earth will not suffice, alwayes making the inside of them very light, that the best may suspect no harm. The nets being thus setup, let him return again to his Dogs, loosing them all; and every Hunter arming himself with darts and a Boars Spear, so let the most skilfull sollow the Dogs close to exhort them and set them on, the residue follow one after another a good difance, scattering themselves into sundry angles, for their better safeguard and end of their sport: for if they should come all together, the Boar might light upon them, and wound some of them, for upon whomfoever he falleth in his rage he hurteth them : furthermore when the Dogsbeginto come neer to his lodging, then must they be set on more eagerly, and so heartned that they be no wayes appalled at the raising of the Boar, for his manner is to make force at the foremost Dog that is necrest to him, so must be be followed in chase even unto the nets, but if the nets stand upon a fide-hill, or a fleeprock, then when he is infnared he will get out with no difficulty; but if it stand upon plain ground, the toyls will hold him till the Hunters come, who must prefently take care to wound him with darts and spears before they meddle with him, compassing him round about very warily, fo that he nor they hurt any of the Dogs, and especially they mult wound him in the face or shoulders, where the wounds are mortall, as I have faid before: but if it happen that the beaft getteth loofe when he feeleth the blowes, the Hunters must not start away, but the frongest of them to meet him with his spear, setting his body as we have formerly expressed, having an especiall eye to the beasts head, which way soever he windeth and turneth the same, for such is the nature of the Boar, fometimes he fnatcheth the spear out of the Hunters hands, or elserecoyleth the force back again upon the smiter, for by both these means the Hunter is overcome and overthrown: Whenloever this hapneth, then is there but one means to fave the Hunters life, which is this; another of his companions must come and charge the Boar, making as though he would wound him with his dart, but not casting it for fear of hurting the Hunter under his see. When the Boar feeth this, he forsaketh the first man, and rusheth upon the second, who must look to defend himself with all dexterity, composing his body, and ordering his weapons, according to artificiall Boar-hunting, and in the mean season the vanquished Hunter must arise again, taking fresh hold on his spear, and with all courage setting upon the adversary beast, to wound him either in the shoulders or in the head, for it is no credit to escape with life, except he kill and overcome

When he feeleth himself thus wounded that he cannot live, if it were not for the cross and forks upon the Boar-spear, he would presse in upon the vanquisher to take revenge in his death: For so great is the servent wrath of this beast, that he spareth not to kill and wound, although he feel upon him the pangs of death: and what place foever he biteth either woon Dog on the hough he feel upon him the pangs of death: upon Dog or man, the heat of his teeth inflicteth a dangerous inflaming wound: and for the cause if he doth but touch the hair of Dogs, he burneth it off: but if it be a semale that is ruled, (for there is as great a rage in females as in males, though not fo great power) then must the hoter take head he can fill as the males as in males, though not fo great power) then must the head he can fill as the manual files ter take heed he never fall to the ground, for as the male hurteth not but when a man funded of lierh high. Go the formal human the first high. lieth high, fo the female hurteth not but when a man falleth or lyeth low : therefore if the thate chance to fall, he must raise himself with all speed, using no lesse dexterity and courage against the female, then he doth against the male.

nets in all passages, through which it is likely the beath will go, then do the men and Dogs with a gallant crie, filling the woods and fields, raife them out of their lodgings. In the mean feafour the cris of men, and purfued by a multitude of greedy Dogs, forth he runneth in some of his usuall waves, cerefully looking behinde him, to avoid the train that followeth, until he fall fast enclosed into the Hunters nets, then cometh the keeper of the nets, and woundeth him with his Boar-foear. as I faid before: but if it fortune that he fall out of the nets, or never cometh to them, then mult they profecute him, both men and Dogs, untill they have wearied him, for fuch is the heat of his body, that he cannot long stand, and although he shall lodge himself in some Marish or woods where the Hunters can have no use of their nets, yet must they not be afraid to approach unto him, and with such hunting inftruments as they have, shew the magnitude and courage of their minde, by attaining their game by the strength of hand, when they are deprived from the belp of Art: And to conclude, the same devices, diugence, labour, prosecution, and observations, areto be used in the hunting of the Boar, which are prescribed for the hunting of the Hart. It feldome falleth out that the Pige of wilde Swine are taken, for they run and hide themselves among the leaves, and in the Woods, seldome parting from their parents untill their death, and as we have faid already, the dams fight for their young ones most irefully. For it is not with these as with the vulgar Swine; that they beat away their young ones from following thom, but because they conceive but feldome, they fuffer their Pigs to accompany them a whole year: And thus much for the violent and forcible hunting of Boars. Now followeth the artificiall devices and politick means policies which have been invented for the fame purpose, whereby to take them without pursuit of to take Boars. Dogs: And first of all, the same engine which we have prescribed for taking of the Hart, are also inule for taking of the Boar, and Retrus Creftentienfis theweth how a multitude of Boars may be taken together in one ditch ; and first of all (he faith) neer to the place where Boars make their abode. they fow in some plain fields a kinde of fatting corn which Hogs love, and about that field they make abigh and firong hedge, of the boughs of trees in the one part, whereof they leave a great gap, yet not skogether down to the ground. At the time of the year when the grain waxeth ripe, the Boars gather thereinto in great number: now right over against the faid gap on the other fide, there is nother little low place of the hedge left, over which the Swine may eafily leap. When the watch-men hunter feeth the field full, he cometh alone and unarmed to the first gap, and therein he standesh lewring and making a terrible noise to affright the Swine; now on the other lide where the hedge is left low, there is also made a vast and deep ditch, the Hogs being terristed with the presence and noise of the Hunter, and seeing him stand in the place of their entrance, run to and fro to feek another escape, and finding none, but that low place of the hedge before the dithover they presse headlong as fast as they can, and so fall into the trench one upon another. Again, neer Rome there be divers that watch in the woods, and in the night time when the Moon hinth, fet up certain Iron instruments through which there gliftereth fire, unto which the Boars and wilde Swine will approach, or at the leaftwife fland fill and gaze upon them, and in the mean featon the Hunters which fland in fecret come and kill them with their darts; and to conclude, in Armenia, there are certain black venemous fishes, which the inhabitants take and mixe with meal and cast them abroad where Boars and wilde Swine did haunt, by eating whereof as also Hemlock and Henbane, they are quickly poisoned, and die: And thus much we have shewed out of Xenophon

and other Authors, the severall wayes of hunting and taking of wilde Swine.

Now for a simulating thereof hath been often shewed to be dangerous both to men Men that have and Dogs, I will a little adde some histories concerning the death of them, which have been killed perished by

by Boars. For if that cometh not to passe which Mertial writeth;

Boars in hunt-

Thusca glaudie Aper populator. & ilice multa. Impiger Ætole fema fraunde fera, Quem mene intravit splendenti cuffide culter. Prada jeces nostrie invidiose focie.

lay, if the Boar be not killed by men, the Hunter is confirmed many times to say with Lydis in the same Poet,

Fulmines framantis apri fum dente perempta.

halis reporteth of one Leoplemus, that he loved the wife of Throfilm; now to the interest that he might possesses, he took her husband abroad with him to the hunting of a Boar, that ander colour thereof he might kill him, and fay the Boar flew him : Being abroad the nets railed, and the Dogs loofed, there appeared unto them a Boar of a monitrous thape, wonderfull fat, with horrible hair, a skin fee with flanding briftles, rough upon the back, and his mouth continually foaming out a bundance of froath, and the found of his gnathing teeth ringing like the ratling of arthor; having fre-burning eyes, a despiteful look, a violent force, and every way fervent he flew the noblest Dogs which fiff fet upon him, not flaying till they came to him, but he fought out for them, breaking their cheeks

The History of Four-footed Beasts.

and legs afunder, even as a Dog will do some small bones; then he trod down the nets in disdain, nas and legs alunuer, even as a bog with the first encounter, and yet remembring his own vigor and strength fing by them that onered nim the first counter, and yet remembring its own vigor and strength turning back again upon them, first overthrowing them, and grinding them betwirt his teets like Apples, at length he meets with Thrafillus, and first teareth his cloth from his back, and then like. Apples, at length he meets with Thrafillus, and first teareth his cloth from his back, and then like wife tore his body in pieces, and this man I remember in the first place to be killed by this monfler. Boar, whether he was a beast or a man. Martial in his book of ipectacles remembreth a fory of the results for the young ones leaved out of her believed. Diana, who killing of a wilde Sow with Pig, the young ones leaped out of her belly, and this I thought good to remember here, although it be fomewhat out of place;

> Inter Cafarea discrimina sava Diona, Fixifet gravidam cum levis bafta fuem. Exiliit partus mifera de vulnere matrie, O Lucina ferox boc peperiffe fuit?

Ancew the father of Agopenor was killed by the Calidonian Boar, as we have faid already. Comment was flain by a Boar in the mountain Imolus. There was one Attas a Syrian, and another an Areadian, and both these were flain by Boars, as Plutareb writteth in the life of Sectorius. It is reported of one Atter a Phrygian, that as he kept his Sheep he did continually fing fongs in commendation of the mother of the Gods, for which cause she loved him, honoured him, and often appeared man him , whereupon Jupiter fell to be offended, and therefore fent a Boar to kill Attes. Rea after his death lamented him, and caused him to be buryed honourably. The Phrygians in his remembrance did every year in the spring time lament and bewail him.

Adone alfo, the Leman of Venm, is faigned of the Poets to be killed by a Boar: and yet Marshim faith, that it is an allegory of the Sun and the Winter, for Adonis fignifieth the Sun, and the Boar the Winter: for as the Boar is a rough and fharp beaft, living in moyft cold, and places covered with frost, and doth properly live upon winter fruits, as Acorns, fo he is the fitter emblem for Winter, that is, a devourer of the Suns heat and warmth, both which fall away by death from all living creatures. When Tembras a King of Myfia went to hunt in the mountain Thrafillus, he flatted a huge great Boar, which he and his guard followed and hunted unto the Temple of Diana Ortholia. whereinto the Boar entred for fanctuary.

The poor beaft feeing the Hunters at hand, cryed out with the voice of a man: Pane & ren smull Dee, O King spare Dianaes Boar : But the king being nothing at all moved therewith, flew him in the Temple; which wickednesse the Goddess could not endure, and therefore first of all the reflored the Boar to life, and afterwards afflicted the King with madnesse, who was therefore driven into the Mountains, and there lived like a beaft.

When Lysippe his mother knew hereof, she went to him into the Woods, and carryed Gnenius the Prophet, who instructed him to pacifie the Gods by a facrifice of Oxen, which when it wasperformed, the King recovered again his right minde, and fo his mother in remembrance thereof, built there a Chappell to Diana, and fet thereupon the picture of a Boar in Gold, with a mans mouth, There was also a custome in ancient time for champions and their fathers brethren and kindred to fwear by a Boar cut in pieces. And thus much for the naturall and morall flory of the Boar, which I will conclude with those verses of Horace, describing the prodigious habitation of Boers in the waters, and Delphins in the Woods, as if one had changed with another;

> Delphinum filvis appingie, fluttibus aprum, Qui variare cupit rem prodigialiter unam.

> > The Medicines of the wilde Swine.

There are declared a M. things concerning the remedies of Goats, but a larger and more ample power shal be shewn of a wilde beast of the same kinde. Also the same regard shall be had concerning the remedies of a tame Sow and a wilde Boar, yea, of all other tame and wilde beafts, that is, that the same or things like to either of them may be ended, differing only according to more or leffe, because the same parts of wilde beafts living, are lesse moist and cold then those that aretame. That which we repeat here concerning the common remedies of a Boar and Sow tamed, in some of the parts of them, to wit, the blood, the brain, the scheek-bone, the lungs or lights, the liver, the

gall, the ankle bone, the hoof, the dung, and urine, is not in the Sow repeated before.

The brains of a Boar taken with blood, is very much commended against the bitings of Serpents.

Again, the brains and blood of a Boar, doth help those that sear the coming of Carbuncles. The make lard and fat of a Boar being fodden and bound fast together, doth with a wonderfull celerity make firm those bones that are broken. The fat of a Boar mingled with Hony and Rozin, is very much

commended against the bitings of Serpents. The fat of a wilde Boar mingled with the fat of the lungs or lights, doth very much profit those which have their feet broken or bruised by any mischance. The fat of a Boar being mixed with Oyl of Roses, is very good for those that are troubled with blisters or pushes, it being anointed thereupon. The brains of a Boar is very profitable for Carbuncles, and the pains of a many part. of a mans yard. The brains of a Boar being bruised very small in Hony, and put thereto, doth

wonderfully make it found. The brains of a Boar fodden and drunk in wine, doth cafe all the pains wonderfully There are more things spoken concerning the remedies of the brain in the medicines of the Sow. The after of the cheek-bone of a Boar doth cure thosoulcers which do encrease bigger by little and little. The off to 1 dec 1240.

Alfo the fame thing doth make firm those bones that are broken. The lungs or lights of a Boar mixed with horry, and put upon the feet after the manner of a mollifying emplaifier, they shall be freed from all expicerations: Dissibilities also doth commend the lungs or lights of Sowes. Lambs and Bears. The liver of as Boar being new killed and foorched by a fire, and beaten to physics, and so being taken in wine, is an especiall remedy against the bitings of Serpents and Dogs. The liver of a Boar being old, and drunken in wine with Rue, is very much commended against the hitings of Serpents. The Fibres of the liver of a Boar, and those especially which are neerest to the entrance of the gall and liver, being taken in Vinegar or rather wine, is much profitable against the

The liver of a Boar is good to revive those whose spirits are drowsie. The liver of a Boar doth much profit, being fropped in the ears, for those that are troubled with Apostumes or any running fores therein. The liver of a Boar being new killed and drunken in wine is very effectuall against the loofenesse of the belly. There are certain little stones in the liver of a Boar, as there is in a common or vulgar' Sow, or at leastwife like unto little stones, and they are also white, which being fodden and taken in wine, are very effectuall against the disease of the Stone. Thou shalt read, many more things Concerning the remedies of the liver of a Boar in the medicines of the Sow. The gall of a Boar is very much commended for Wennes or swellings in the neck.

The gall of a Boar being mingled with Rolin and Wax, doth cure those ulcers which do encrease the gail of a Boar being imiged with teams wilk, being mingled together, and dropped in the ears, is very profitable for all pains therein. The body of a man being anointed with the gall of a Boar, doth thirte him up to carnal copulation. The gall of a Boar being mingled with fewer and applyed upon every joynt of the body, doth immediately cure all pains of the Gowt. We have declared also many things in the medicines of the Sow, concerning the remedies of the gall of a Boar. The ftones of a Boar being eaten is very good against the Falling sicknesse, or the stones of a Boar being taken in Mares milk or water, is also very effectual against the same disease. The hoofs of a Boar being burned to ashes, and sprinkled upon drink, and so taken, doth very much help those that cannot easily make water.

The hooves of a Boar being burned and beaten to powder, and given in drink, is very effectual against the stopping of urine. The hooves of a Boar or Sow being burned, and given to drink in wine, is very much commended for those that cannot hold their urine in their sleep. The dung of a Sow (which liveth in the Woods) being dryed and drunk in water and wine, doth ftay the voiding ofblood, and doth ease also old pains of the sides: And again being taken in Vinegar, it doth stay all ruptures and convultions, and also being mingled with the syrup of Roses, it doth remedy or helpthose places which are out of joynt.

The dung of a Boar being new made, and hot, is a speciall remedy against the flux of blood which issueth forth of the Nostrils. The dung of a Boar being mingled in wine, and applyed after theform of an emplaister, do presently draw away and make found any thing which cleaveth to the body. It being also bruised and sodden with hony, and afterwards kneaded like Dough, and so applyed to the joynts, doth eafe all pains that grife therein.

An emplaister made of the dung of a Boar, is very profitable against all venemous bitings, for it draweth forth the poyson. All other ulcers are filled up and cleansed with the dung of a Boar, except those which anise in the thighes. The dung of a Boar dried and beaten to powder, and sprinkled upon drink, doth cure all pains of the fides. Again it being dried and beaten to powder, and administred in wine, doth not only cure the pain in the Spleen, but also the pain in the kidneys The dung of a Boar being burned to the aftes, and given to drink in wine, doth ease all pains in the knees and legs. The dung of a Boar new made and anounted upon those places that are out of joynt, is very profitable for them. The dung of a field-boar mixed with brimstone, and taken in Pliny. wine, and strained Pitch, is very commendable for pains in the hips. The dung of a Boar being min- Marcellus. gled with wine, and afterwards strained, and given to drink, about the measure of two little cuphis at a time, doth speedily help those which are troubled with the Sciatica.

. It also being sodden in Vinegar and Hony, doth mitigate all pains that rise in the seet or ankles The dung of a Boar burned to ashes, and sprinkled upon wine luke-warm, and so given to drink, doth help all those that are troubled with the bloody-flix. The rest of the remedies which concem the dung of a Boar, thou shalt find in the medicines of the Sow. The urine of a Boar mingled with Hony and water, and so taken, is a special I remedy for those that are troubled with the Falling fick neffe.

Again, the urine of a Boar being taken in sweet Vinegar, doth drive out those things which are dryed in the bladder. The urine of a Boar being kept in a glasse, doth cure all diseases and pains in the cars, but it is especially profitable for those which cannot hear. The urine of a Boar being Sextm. kept in a glasse, and made luke-warm, and dropped into the ears, is a speciall remedy for all Aposlumes that are therein. The urine of a Boar which is kept long, is far more profitable, if so be that it be kept in a vessel of glasse. Again, the urine of a Boar being dryed in smoak, and moistened with Hony, and so powred into the ears, doth cure the deafnesse of the ears-

Aaa 3

The

Sextus.

Marcellus.

The urine of a Boar, and Oyl of Cypresse, each of them being equally mingled, and made lukewarm, is also good for the same disease.

warm, is an o good for the latine diese.

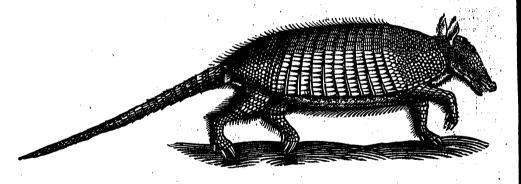

The urine of a wilde Boar alfo is of the same force and vertue. The bladder, of a wilde Boar also is of the same force and vertue. The blather of a Gott doth stay the incontinency of the urine, if it be eaten, rosted, or boyled. The blather of a Gott being burged to powder, and given to drink in water and wine, is very good and profitable for the which cannot make water easily. The urine of a Boar being drunken, doth help those that are troubled with the stone in the bladder, but it is more effectuall if it be first of all mingled with are troubled with the stone in the bladder, but it is more effectuall if it be first of all mingled with the dung. The Bladder of a Boar moistened with the urine, and hung up until the waterish has the sum of the stone which are true ulent with the Strangury, is more cometh forth, and then boyled and given to those which are true ulent with the Strangury, is

very profitable and good for them.

The Bladder of a Boar being dried and given in drink, is very profitable for those which are troubled with pains in the bladder and wringings of the guts. The urine of a tame Boar hing up in the smoak in the bladder of a Sow, and mixed with drink, is very profitable for those up in the smoak in the bladder of a Sow, and mixed with drink, is very profitable for those that are troubled with the Strangury. The urine of a Boar, or at least wise the bladder better that are troubled with the Strangury ing good for those that are troubled with the Stone. The urine of a Boar being taken in drink, is very good for those that are troubled with the Stone.

Now forasmuch also as Hunters are hurt by some, I thought it good to set down what remedies some forasmuch also as Hunters are hurt by some, I thought it good to set down what remedies is fit for them. Therefore the wounds made of them are dangerous, because they are not only deep, but also large and great, and it is also impossible to bring them to a glutination with medicines, for the lips of the wounds which is made by contusion, are cut off and burned. They use remutuall gnashing and striking of their teeth together, as it were against a whethone, to take remutuall gnashing and striking of their teeth together, as it were against a whethone, to take rewring upon those which pursue and sollow them. Therefore they cause a certain scab to gow upon the lips of the wound, wherefore it is meet to use a suppurative and not a glutinative manner of cure in them. It is meet to use in running and moist ulcers, not hot things, but cold both in Winos cure in them. For it is an easie matter for a Boar to hurt a Horse in the inside of his knee, in ter and Summer. For it is an easie matter for a Boar to hurt a Horse in the inside of his knee, in the time of his hunting, which doth breed to a waterish ulcer, and there doth also sollows welling. To this cold things are to be applyed, and it is to be cured by anointing it with a medicine which ing. To this cold things are to be applyed, and it is to be cured by anointing it with a medicine which is called Diackaleanthers, or the head of a Dog, being burned about the tongue, and beaten into powder, and so to be applyed after the manner of a Cataplasme. And thus much concerning the medicines of the Boar.

Of the TATUS, or Guinean Beaft.

This is a four-footed strange Beast, which Bellonius saith, he found in Turchia, among the Mountebanks and Apothecaries. It is brought for the most part out of the new-sound world, tebanks and therefore may be saiely conveyed into these parts, because it is naturally covered with a hard shell, divided and interlined like the sins of fishes, outwardly seeming buckled to the back like Coat-armor, within which the beast draweth up his body, as a Hedge-hog doth within his prickled skin; and therefore I take it to be a Brassian Hedge-hog. It is not much greate then a little Pig, and by the snout, ears, legs, and feet thereof, it seemeth to be of that kind, saing that the snout is a little broader, and shorter then a Pigs, and the tail very long like a Lizards of that the snout is a little broader, and shorter then a Pigs, and the tail very long like a Lizards or Rats, and the same covered all over with a crust or shell. The gaping of the mouth is wider that Swines; and one of these being brought into France, did live upon the eating of seeds, and fruits of the Gardens, but it appeareth by that picture, or rather the skin stuffed, which addianus Marcellus the Apothecis

thecary of Viner, fent unto Gesner, from whence this picture here expressed was taken, that the reet thereof are not cloven into two partslike Swine, but father into many like Dogs, for upon the hinder seet there are five toes, and upon the fore seet four, whereof two are so small that they are scarce visible. The breadth of that same skin was about seven singers, and the length of it two spans, the shell or crust upon the back of it did not reach down unto the rump or tail, but broke off as it were upon the hips, some four singers stom the tail. The Merchants as I have heard, and Citizens of London keep of these with their Garden worms.

Of the AIOCHTOCHTH.

There is another beast that may be compared to this, (whereof Cardanus writeth) and he calleth the name of it Aistochib. It is a strange creature found in Hispania Neva, neer the River Alvaradus, being not greater then a Cat, having the bill or snowt of a Mallard, the seet of a Hedge-hog, and a very long neck. It is covered all over with a shell like the trappings of a Horse divided as in a Lobster, and not continued as in an Oyster; and so covered herewith, that neither the neck nor head appear plainly, but only the ears; and the Spaniards for this cause call it Armanot indeed so cloven, that they remain unequal, but are like to a Horses, I mean the severall cloves. There are of these as I have heard to be seen in Gardens in London, which are kept to destroy the Garden worms.

Of the TIGER.

HE word Tigris is an Armenian word, which fignifieth both a swift Arrow, and a great The names of River, and it should seem that the name of the River Tigris was therefore so called, because of the swiftnesse thereof; and it seemeth to be derived from the Hebrew word Gir and Gitra, which signifies a Dart. Munsser also in his Dictionary of three languages, doth interpret Tigrs for a Tiger. In the 4. of Job the word Lairk by the Septuagints is translated Marmelon, and by S. Irom, Tigris. The Jewes call the same beast Phoradei, which the Greetans call Tigris; ladians, Tigre and Tigra, the French Un Tigre, and the Germans Tigerthier.

Now concerning the name of the River Tigris, which the Greetans Togerthier.

Now concerning the name of the River Tigrie, which because it joyneth in affinity with this Of the River healt when the concerning the name of the River Tigrie, which because it joyneth in affinity with this Of the River healt when the concerning the name of the River h

beatt, it is necessary that I should say something in this place, because that we finde in holy scrib beatt, it is necessary that I mound say tomother through Paradife; which according to prure that it is one of the four Rivers which runneth through Paradife; which according to Jaffallerh into the Red Call State of the R maketh many compasses and windings in the world, and at last faileth into the Red least and they maketn many companies and white many further fay, that there is no River of the world that runneth fo swiftly as this: And therefore The further lay, that there is no kiver of the world that the relief aquet: That is, it is called a Tigor a Datt, gris vocatur, id eft Sagitta, quod jaculum vel fagittam velocitate aquet: That is, it is called a Tigor a Datt, or Arrow, because it runneth as fast as an Arrow flyeth : and for this cause we finde in Thank tus, that a River in Sicilia was called Acis, that is, Spiculum, a Dart.

Some of the Poets do derive the name of the River Tigris from this Tiger the wilde beaft, where-Some of the Poets do derive the hands, that when Baechus was distracted, and put out of his upon these Histories are told. They say, that when Baechus was distracted, and put out of his upon these Histories are told. Interview of his wits by Juno, as he wandered to and fro in the world, he came to the River Sylax (which was the wits by Juno, as he wandered to and froin the world, he came to the River Sylax (which was the wits by Juno, as he wandered to and froi in the world, he came to the River Sylax (which was the first name of this water) and being there definous to pass over, but found no means to accomplish nrit name or this water, and of his effate did fend unto him a Tiger, who did willingly the him it, Jupiter in commiferation of his effate did fend unto him a Tiger, who did willingly the him upon his back, and carry him over; Afterward Bacobus called that fwift River by the name of that swift beaft, Tiger. Others do report the tale thus. When Dionysia fell in love with the Nymph Alphefibaa, whom by no means either by promises, intreaties or rewards he could slugg unto him, at last he turned himself into a Tiger, and so oppressing the Nymph through fear, and unto min, at last the turned minder med the begot upon her his fon Media, who when he came to agg, remembring the fact of his father and mother, called the name of the River Tigris, because of his Fathers transformation. But to leave this matter as not worth the standing upon, whether the Bi. ver was called after the name of the beaft, or the beaft after the name of the River. or rather both of them after the name of the dart or fwift Arrow, we will proceed to the natural flory of the Tiger, commending that to the Readers judgement which is effential to this flory, containing init neceffary learning, and garnifhed with all probability.

Countries breeding Tigers.

Quantity of

First of all therefore, Tigers like Lyons are bred in the East, South, and hot Countries becau se their generation desireth abundance of heat, such as are in India, and near the Red sea, and the people called Alanga, or Besingi, which dwell beyond the River Ganges, are much troubled and annoyed with Tigers. Likewise the Prassans, the Hyrcanians, and the Armenians. Applimin with his companions travelling betwixe Hiphafis and Ganges, faw many Tigers. In Brigges and Dachinabades, which is beyond the Mediterraneau Region of the East, there are abundance of Tigers, and all other wilde beafts, as Arrianu writeth. In Hispaniola, Ciamba, and Guanasa, Peter Martyr saith, by the relation of a Spainiard inhabiting there, that there are many Lyons and

The Indians fay, that a Tiger is bigger then the greatest Horse, and that for strength and swiftness they excel all other beasts. There be some which have taken them for Tigers, which are called Thoer, greater then Lyons, and leffer then the Indian Tigers, as it were twice to big as Lyons; but I rather agree to the relation of Arrianus; Strabo, Megasibener, and Mearcus; for they lay this Tiger feareth not an Elephant, and that one of them hath been feen to fly upon the head of an Hielbant, and devour it: and that among the Prassans, when four men led one of these Tigers tamed by the say they met with a Mule, and that the Tiger took the Mule by the hinder leg, drawing him as a basic big in his teeth, notwithstanding all the force of the Mule and his four leaders; which is unto me 4 miles ent argument not only of his strength, but of his stature also: and if any have been seen the stature, they have been mistaken either for the Linxes, or for the Thoes.

The leveral

The similitude of the body of this beaft is like to a Lionesses, for so is the face and the mount; the lower part of the fore-head, and gnashing or grinning teeth, and all kinde of creatures which are ravening, are footed like a Cat, their neck thort, and their skins full of spots, not round like a Panthers, nor yet divers coloured, but altogether of one colour and square, and sometimes long, and therefore this beaft and the Panther are of fingular note among all the four-footed: yet Solina and Seneca feem to be of opinion that their fpots are sometimes of divers colours both yellow and black, and those long like rods in these fayings:

> Tibi dant varia pectora Tigres. Ubera virgata fera Caspia. And Silim faith : Corpore virgato Tigris.

Oppianus.

It were needless to speak of their crooked claws, their sharp teeth, and divided feet, their long tail, agility of body, and wildeness of nature which getteth all their food by hunting. It hash been falfely believed, that all Tigers be females, and that there are no males among them, and that they engender in copulation with the winde; whereupon Camerarius made this witty riddle in his the torical exercises:

> A fluvio dicor, fluvius vel dicitur ex me, Juntiaq; sum vento, vento velocior ipso, Et mibi dat ventue natos, nec quero maritos.

The Epithets of this beafts are thefe : Armenian Tigers, sharp, Ganiellean , Hyrcanian, fieres The Epithett

cruel, and wicked, untamed, spotted, divers coloured, straked, bitter, ravenous, African, greedy, Cabian, Corcefian, Caucasean, Indian, Parthian, Marsian, straight-sooted, mad, fiffe, feartul, strong, foaming, and violent, with many such others, as are easie to be found in every Author. The voice of this beaft is called Ranking, according to this verse:

Tigrides indomita rancant, rugiuntq; Leones,

Now because that they are strangers in Europe, as we have said already, never breeding in that part of the world, and as feldom feen, we must be constrained to make but a short story of it, because there are not many divers things concerning the nature of it, and in the Phylick none at all. For Their food. the manner of their food; they prey upon all the greatest beasts, and seldom upon the smaller, as Oxen, Harts, and Sheep, but Hares and Conies they let alone.

It is reported by Plutarch, of a tame Tiger that was brought up with a Kid, the faid Kid was kil. A billory. led and laid before him to eat, but he refused it two days together, and the third day oppressed with extremity of hunger, by her ranking and crying voice she made signes to her Keeper for other meat, who cast unto her a cat, which presently it pulled in pieces and devoured it. The like story unto this we have shewed already in the Panther. Generally the nature of this beaft, is according to the Epithites of it, sharp, untamed, cruel, and ravenous, never so tamed, but sometimes they return to their former natures; yet the Indians do every year give unto their King tamed Tigersand Panthers, and fo it cometh to pass, that sometimes the Tiger kisseth his Keepet as Seneca

In the time of their lust they are very raging and furious, according to these Verses of Virgil:

Per sylvas tum sevus aper, tum pessima Tigrus Heu male cum Libya solis erratur in agrus.

They ingender as Lions do, and therefore I marvel how the fable first came up, that they were all Their copulafemales & had no males among them, and that the females conceived with young by the West wind. tion and gene-We have shewed already in the story of the Dogs, that the Indian Dog is engendered of a Tiger and ration, a Dog, and so also the Hircanian Dogs: Whereby it is apparent, that they do not only conceive among themselves, but also in a mingled race. The male is seldom taken, because at the sight of a man he runneth away, and leaveth the female alone with her young ones, for he hath no care of the whelps, and for this occasion I think that the fables first came up that there were no males among the Tigers. The female bringeth forth many at once like a Bitch, which she nourisheth in herden very carefully, loving them, and defending them like a Liones from the Hunters, whereby theis many times enfoared and taken. It is repoted by Ælianur, that when they hear the found of Bels and Timbrels, they grow into fuch a rage and madness, that they tear their own flesh from

For the taking of Tigers, the Indians near the River Ginges have a certain herb growing like Bu-The taking gloß, which they take and press the juyce out of it, this they preserve beside them, and in ftill significant calm nights, they pour the same down as the maight of the Translation of t lent calm nights, they pour the same down at the mouth of the Tigers den, by vertue whereof it Plutarch. is faid the Tigers are continually enclosed, not daring to come out over it through some secret opporations. fition in nature, but famish and dye, howling in their caves through intolerable hunger. So great is the swiftness of this beast, as we have shewed already, that some have dreamed it was conceived by the winde. For as the swiftest Horses, and namely the Horses of Dardann, are likewise fabled to be

begotten by the Northern winde, so the Tigers by the West winde.

Therefore they are never taken but in desence of their young ones, neither is there any beast Philostraim. that liveth upon preying fo swift as they : Solam Tigrim India insuperabilem effe dicunt, queniam sugiendi celetitate, que ventos equare dicitur, è conspettu aufugit. Only the Tiger, the Indians say can never be conquered, because when he is hunted he runneth away out of sight as sast as the winde. For this cause they diligently seek out the caves and dens of the Tigers where their young ones are lodged, and then upon some swift Horses they take and carry them away: when the female Tiger teturneth and findeth her den empty, in rage the followeth after them by the foot, whom the quickly overtaketh, by reason of her celerity.

The Hunter feeing her at hand, casteth down one of her Whelps: the distressed angry beast knowing that the can carry but one at once, first taketh up that in her mouth, without setting upon the Hunter, contented with that one, returneth with it to her lodging; having laid it up fafe, back again the returned like the wind to pursue the Hunter for the residue, who must likewise set her down anothe, if he have not got into his ship, for except the hunter be near the water side, and have a ship ready, the will fetch them all from him, one by one, orelfe it will cost him his life: therefore that enterprise is undertaken in yain upon the swiftest Horses in the world, except the waters come betwint the Hunter and the Tiger: And the manner of this beaft is, when she seeth that her young ones are shipped away, and she for ever deprived of seeing or having them again, the maketh so great lamentation upon the Sea shore howling, braying and rancking, that many times she dyeth in the same place, but if the recover all her young ones again from the Hunters, she departeth with unspeakable in the same place. speakable joy, without taking any revenge for their offered injury.

die no

For this occasion, the Hunters do devise certain round sphears of glas, wherein they picture their For this occasion, the runters to be seen by the dam, one of these they cast down before her at her apyoung ones very apparent to be seen by the samples that her young ones are inclosed therein, and proach, the looking upon it, is deluded, and thinketh that her young ones are inclosed therein, and proach, the looking upon it, is using a still the state of it is apt to rowl and thir at every touch, this the the rather, because through the roundness thereof it is apt to rowl and thir at every touch, this the the rather, because through the roundness the test it with her feet & nails and so feeing the that driveth along backwards to her den, and there breaketh it with her feet & nails and so feeing the that driveth along backwards to ner uen, and the Hunters for her true Whelps; whileft they in the mean is deceived, returneth back again after the Hunters for her true Whelps; whileft they in the mean is deceived, returneth pack again and a state of elegone on some shipboard. It is reported by Jibamei season are safely harbored in some house, or else gone on some shipboard. It is reported by Jibamei season are sately narpored in some flow of a male and female Tiger. In the Island Dariene, flanding Ledefina a Spaniard, this excellent flow of a male and female Tiger. In the Island Dariene, flanding Ledefine a Speniard, this extended from Right and the found World, fome eight days fail from Hiffmiele, it fell out in the Occidental Ocean of the New-found World, fome eight days fail from Hiffmiele, it fell out in the Occidental Ocean of our Lord 1514, that the faid Island was annoyed with two Tigers, a male (saith ne) in the year of our said a year together, so that there was no night free, but they loft some of their and a temale, for mail a year together, or a Mare, or a Hog, and Swine, and in the time that cattel, either a Horse, or an Ox, or a Cow, or a Mare, or a Hog, and Swine, and in the time that catter, entirer a rione, or all the same take for men to go abroad in the day time, much left in the their young ones und mes, is weather they did not first of all meet with another beaft: At leight night; but they devoured a man, if they did not first of all meet with another beaft: At leight might; but they devoured a many street they confirmed them to device a remedy, and to try fome means the Countrey thus oppressed, necessity confirmined them to device a remedy, and to try some means to mitigate their calamities, wherefore they fought out all the ways and paths of the Tigers to and to mitigate their talantities, why might take vengeance upon the raveners for the lofs of fo much from their dens, that fo they might take vengeance upon the raveners for the lofs of fo much bloud: At the last they found a common beaten way, this they cut afunder and digged deep into a large dungeon: having made the dungeon, they frewed upon the top of it little flicks and laves, fo covering it to diffemble that which was underneath, then came the heedless Tiger that way, and 10 covering it to uniterible that which harp Iron flakes, and pointed inftruments as they had there fer, with his roaring he filled all the places thereabout, and the Mountain founded with the eccho of his

The people came upon him, and casting great and huge stones upon his back killed him, but first of all, he broke into a thousand pieces, both the stones, Weapons, and Spears, that were cast against of all, he broke into a thousand pieces, both the stones, weapons, and Spears, that were cast against of all, he broke into a thousand pieces, both the stones. him; and fo great was his fury, that when he was half dead, and the blond run out of his body, he terrified the standers by beholding and looking upon him. The male Tiger being thus killed, they followed the footheps into the Mountains where the female was lodged, and there in her absence took away two of her young ones, yet afterward changing their mindes, carryed them back sgain, putting upon them two brazen collers and chains, and making them faft in the same den, that so when they had sucked till they were greater, they might be with pleasure and safety conveghed into Spain. At last when the time appointed was come that they should be taken forth to be fent away, the people went to the den, wherein they found neither young nor old, but their collers fastened in the same place that they had left them, whereby it was conceived that the envious mother had killed and torn her young ones in pieces, rather then they should fall into the hands of the honters; fo that this beaftly love of hers, ended in horrible cruelty, and for this occasion is it that Me.

dea thus speaketh in Ovid;

Hot ego fi Pallar, tum me de Tigride natam, Tum ferrum & scopulos gestare in cor de videbor.

And for this cause it was faigned, not without fingular wit by the Poets, that such persons as latisfie the fulness of their wrath in extremity of revenge, are transformed into Tigers. The fame Poet compareth the wrath of Perfem standing betwixt two advantages unto a Tiger betwint two preysor herds of cattel, being in doubt whether of them to devour, in this manner;

> Tigrie ut auditie diverfa valle duorums Extimulate fame, mugitibus ermentotum, Nefcit utro potint ruat, & ruere ardet utroq; Sie dubius Perfeue dextra lavave feratur.

In ancient times these Tigers were dedicated to Bacobin, as all spotted bealts were, and that the faid Tigers did draw his Charriot whileft he did hold the rains; and therefore Ovid faith they;

> Bacthus in curru quem fummum tenerat uvis, ... Tigribus adjunctis aurea lora dabat. And Herace in this manner; Her te merentem Bacche pater tue Vexere Tigres indocili jugum collo trabentes.

Tigers, notwithstanding their great mindes and untamable wildeness, have been taken, and brought in publike spectacle by men, and the first of all that ever brought them to Rome, was Angulus, when Quintum Tubero, and Fabius Maximus were Confuls, at the dedication of the Theater of Marcelus, the which Tigers were fent unto him out of India, for presents (as Dion writeth.) Afterwards Cla dius presented sour to the people; and lastly Heliogabatus caused his chariots to be drawn with To gers, whereunto Martial alluded when he faid;

or at Infall copie which to refely believe as years to

Leichard of whom we pake before affirmeth, that he did eat of the Tigers field that was taken in Ening of Tithe dich in the Island Darless, and that the field there of was nothing inferior to the field of an Ox, gers, but the Indians are forbidden by the laws of their Countrey, to eat any part of the Tigers field, except the hanches. And thus I will conclude this flory of the Tiger, with the Epigram that Martial made of a Tiger, devouring of a Lion.

Lambere securi dextram & consueta magistri, Tibris ab Hyrcano gloria rara juge, Sava ferum rabido laceravit dente Leonem:

Res nova, non ullis cognitatemporibus. Aufa est tale nibil sylvis dum vizit in altis : Postquam inter nos est, plus feritails babet.

Of the UNICORN.

7B are now come to the history of a Beast, whereof divers people in every age of the world Whave made great queltion, because of the rare vertues thereof; therefore it behoveth us to use some diligence in comparing together the several testimonies that are spoken of this beast, for the better satisfaction of such as are now alive, and clearing of the point for them that shall be born hereafter, whether there be a Unicorn; for that is the main question to be resolved.

Now the vertues of the horn, of which we will make a particular discourse by it self, have been the occasion of this question, and that which doth give the most evident testimony unto all men that haveever feen it or used it hath bred all the contention; and if there had not been disclosed in it any extraordinary powers and vertues, we should as easily believe that there was a Unicorn in the world, as we do believe there is an Elephant although not bred in Europe. To begin therefore with Many beafts this discourse, by the Unicorn we do understand a peculiar beast, which hath naturally but one with horns, horn, and that a very rich one, that groweth out of the middle of the forehead, for we have improper'y hewed in other parts of the history, that there are divers beafts, that have but one horn, and called Uninamely some Oxen in India have but one horn, and some have three, and whole hoofs. Likewise corns. the Bulls of Aonia, are faid to have whole hoofs and one horn, growing out of the middle of their Solinus.

Likewise in the City Zeila of Ethiopia, there are Kine of a purple colour, as Ludovicus Romanus Offianus. Writeth, which have but one horn growing out of their heads, and that turneth up towards their backs. Cafar was of opinion that the Elk had but one horn, but we have shewed the contrary. It is faid that Perioles had a Ram with one horn, but that was bred by way of prodigy, and not naturally. Simeon Sould writteth, that the Music cat hath also one horn growing out of the fore-head, but we have showed already that no man is of that opinion beside himself. Allenus, writteth, that there be Birds in Ethiopia haying one horn on their fore-heads, and therefore are called Unicornes: and Albertus faith, there is a fish called Monoceres, and hath also one horn. Now our discourse of the Unicorn is of none of these beasts, for there is not any vertue attributed to their horns,

and therefore the vulgar fort of Infidel people which scarfely believe any herb but such as they see and therefore the vulgar lott of animals fuch as is in their own flocks, or thy knowledge but fuch as in their own Gardens, or any beaft but fuch as is in their own flocks, or thy knowledge but fuch as in their own brains, or any birds which are not intelled in their own nests, have never made uestion of these, but of the true Unicorn, whereof there were more probs in the world, because queition of these, but of the true unicorn, which state by which diffraction it appearsh be any Unicorns in the blindeth the eyes of God his people, from beholding and believing the prefitness of God his people, from beholding and believing the prefitness of God his people, from beholding and believing the prefitness of God his people, from beholding and believing the prefitness of God his people, from beholding and believing the prefitness of God his people.

The Historycof Four-fabled Beasts.

World.

Torks, Rile to the purpose, that there is such a beast, the Scripture it self witherfeth, for Day the foeaketh in the 92. Plaim: Et erigetur cornu meum tanquam Montecerotie. That is, my horn find be lifted up like the horn of a Unicorn; whereupon all Divines that ever wrote, have not only collected that there is a Unicorn, but alfo affirm the similitude to be betwint the Kingdom of David and the horn of the Unicorn, that as the horn of the Unicorn is wholesome to all beafts and crea. tures, fo should the Kingdom of David be in the generation of Christ, And do we think Hards. vid would compare the vertue of his Kingdom, and the powerful redemption of the world unto a thing that is not, or is uncertain or fantaffical. God forbid that ever any man should so despite the holy Ghost. For this cause also we read in Suidas, that good men which worship God and solutions. low his laws are compared to Unicorns, whose greater parts as their whole bodies are unprofitable and untamable, yet their horn maketh them excellent: fo in good men, although their fleshy parts be good for nothing, and fall down to the earth, yet their grace and piety exalteth their fouls to

Unicorns.

We have shewed already in the story of the Rhinocerot, that Reem in Hebrem signifieth a Unicorn, although Munfter be of another opinion, yet the Septuagints in the translation of Deut. namesin Scri- 33. do translate it a Unicorn, for the Rhinocerot hath not one horn, but two. Rabbi Solomon, Da. vid Kimbi, and Saadius do always take Reem and Karas for a Unicorn, and they derive Remfrom Rom, which signifieth Altitudinem, height, because the horn of the Unicorn is lifted up on high. Hereunto the Arabians agree, which call it Barkeron; and the Persians, Bark; the Chaldeans, Remana. In the 39. of Job, the Lord speaketh in this manner to Job: Numquid acquiescet Monocaros at series. na. In the 39.01 Just the Local peaceta that Numquid ligabis Monocerotem fune suo pro sales faciones, aut ut moretur junta praserie tas? Numquid ligabis Monocerotem sune suo pro sales faciones, aut complanabit glebas vallium post te? That is to say, will the Unicorn rest and serve thee, or tarry beside thy cratches? Canst thou binde the Unicorn with a halter to thy plough to make surrows, or will he make plain the clots of the Vallies? Likewise in the prophesie of Esa. the 34 chap, and in many other places of Scripture, whereby God himfelf must needs be traduced, if there be no

Unicorn in the world.

Befides the Arabians, as And Bellin, writeth, call this beaft Alcherceden, and fay that it hath one horn in the fore-head which is good against poylons. The Grecians call it Montherer, from whence Pliny and all the ancient Grammarians do call it Monoceres, yet the divines both elder and later do name it by a more learned proper Latine word Unicernis. The Italians, Alicorne, Unicerne, Licorne, Leocorno; the French, Licorno; the Spaniards, Unicorno; the Germans, Einborne; and the linim, Gednorozecz: And thus much for the name. All our European Authors which write of beals, do make of the Unicorn divers kindes, especially Pliny, Ludwicus Romanus, Panlus Venetus, Nicholam Venetus, Eneas Sylvius, Albertus Magnus, out of whose words we must gather the best description that we can of the Unicorn. The Arcean Indians (faith Pliny) do hunt a certain wilde best wife is very curft, untamable, having one horn, which in the head resembleth a Hart, in the feet an Bkphant, in the tail a Boar, and in the residue of the body a Horse; the horn he faith, is about two cubits long, and the voice like the lowing of an Ox, somewhat more shrill, and they deny that this bealt is ever taken alive. Elianus writeth hereof in this manner, there are (faith he) dertain Mountains in the midit of India, unto the which the passage is very difficult, whereare abundance of wilde beafts, and among other Unicorns, which the Indians call Cartazonens, who in their tipe age are as big as a Horle, and their mane and hairs are yellow, excelling in the celerity of their feet and bodies, having feet cloven like an Elephants, the tail of a Boar, and one black horn growing out betwixt their eye-brows, not smooth, but rough all over with wrinchles, and the same groweth to a most sharp point, these things (faith Elianus) by comparing of whose words with Play, it is apparent they describe in these words but one and the same beast, and so also doth Phylos whereby I gather, that it is no other beaft then the wilde Ass, or at the least the wilde Ass cometh nearest to the Unicorn of all others, for they agree in these things, first, in that both of them have one horn in the middle of the fore-head; secondly, in that both of them are bred in India; thirdly, in that they are both about the bigness of a Horse; fourthly, in their celerity and solitary life; fifthly and lastly, in their exceeding strength and untamable natures; but herein they differ both in their feet and colours, for the feet of the wilde Affes are whole and not cloven like the Unicorns, and their colour white in their body, and purple on their head; and Elianus faith, that the hora all differeth in colour from the Unicorns, for the middle of it is only black, the root of it white, and the top of it purple, which Bellenim doth interpret, that the superficies or upper face of the born is all purple, the inner part white, and the inward part or middle black; but of this Indian wild.

As we have spoken already, and therefore I will adde nothing in this place but the words of Phillipse in the belief. first w in the life of Apollonia, who writeth in this manner;

The kindes of

Countries of Unicorns.

There are many wilde Affes which are taken in the Fens, near the River Hiphafis, in whole forehead there is one horn, wherewith they fight like Buls, and the Indians of that horn make pots, affirming that whofoever drinketh in one of those pors, shall never take disease that day, and if they be wounded, shall feel no pain, or safely pass through the fire without burning, nor yet be poysbred in their drink, and therefore firch cups are only in the possession of their Kings, neither is it lawful for any man except the King, to hunt that Beaft, and therefore they fay that spotonia looked upon one of those Beasts, and considered his nature with singular admiration.

Now there was one Dam's in his company, who asked him whether he did believe that the vulgar report of the Unicorns horns were true or no, Apollonia made this answer: Adhibeo si bnjus regini immortalen regem esse intellekero, qui enim mihi aut altert talquam poculum ita salubre potest dare,
name verisimile est ipsum qualidie illo uti, & ek eo corna frequente vel ad trapulam usq; bibere, nemo caim ut puto illum calumniabitur qui in tali poculo ctiam inebitetur. That is to lay, I would believe that report, if I found in this Countrey a King that were immortal and could never dye, for if a man would give me fuch a cup, or any other man, do not you think that I would believe he drunk in the ame cup? and who would blame a man if he drunk in fuch a cup till he were drunk? for it were lawful to use that horn unto surfeiting : whereby we may gather the minde of that wife man concerning the Asses horn, and the Unicorns; namely, that they may give one some ease against accicidental difeafes, although they cannot prolong a mans life the space of one day: these things said he. There be Beasts (faith Ariffule) as the Oryx and Indian As, which are armed with one horn, and the cloven footed Oryx is no other than the whole footed As, for in the middle of their forehead they have one horn, by which both fides of their head are armed, Cum medium pariter commune urig; extreme fit, Because the middle is equally distant from both the extremes; and the hoof of this Beaft may well be faid to be cloven and whole, because the horn is of the substance of the hoof. and the hoof of the substance of the horn, and therefore the horn is whole, and the hoof cloven; for the cleaving either of the horn or of the hoof cometh through the defect of nature, and therefore God hath given to Horses and Asses whole hooss, because there is greatest use of their legs, but unto Unicorns a whole and entire horn, that as the ease of men is procured by the helps of Horses, so the health of them is produced by the horn of the Unicorn. These things The use of a (aith Arisate.) And Strabe also writeth, that there are Horses in India, which have Harts heads, Unicorns born. with one horn; of which horn their Princes make cups, out of which they drink their drink against poylon, and therefore by this which hath been laid it appeareth unto me, that either the liden Afsis a Unicorn, or differeth from it only in colour; and the objection of the hoofs is answered by Aristotle. Unto this discourse I will adde the travails of Ludovicus Reman, wherein he faw two Unicorns at Mecha in Arabia, where Mahomers Temple and Sepulcher is. There are preferved (faith he) wirling the walls and Cloysters of that Temple two Unicorns, which by way of miracle they bring forth to the people, and truly not without cause, for the fight is worthy ad-

Now their description is on this fort: One of them and the elder was about the stature of a Colt of two years and a halfold, having a horn growing out of his fore-head of two cubits length, and theother was much less, for it was but a year old, and like a Colt of that age, whose horn was some four spans longs or thereabouts. The colour of them was like a Weaseled coloured Horse, the head ike the head of a Hart, the neck not long, and the mane growing all on one fide. The legs flender and lean, like the legs of a Hinde, the hoofs of the fore-feet were cloven like a Goats feet, and the hinder-legsare all hairy and thaggy with the outfide; the Beafts although they were wilde, we by Artor superfittion; they seemed to be tempered with no great wildeness; it was faid that the King of Albippia, did fend them to the Sultan of Mecha; with whom he is constrained to obferve perpetual amity. Now these Unicorns are of another kinde, then the Unicorns of Pling and Alianus, because their Unicorn hath a whole hoof, and this cloven, but this objection was answered before: and although Pliny and Ariffolle do acknowledge no other Unicorn then the Oryx, whole horn is black, as hard as Iron, and sharp at the point, yet it is clear that there is another Unicorn be-

Now Paulus Venetus faith, that in the Kingdom of Bafman, which is subject to the great Cham, that there are Unicorns somewhat lesser then Elephants, having hair like Oxen, heads like Boars, feet he Blephants, one horn in the middle of their fore-heads, and a marp thorny tongue, wherewith they destroy both man and beast; and besides he addeth, that they muddle in the dirt like Swine. Now if it were not for the horn in the middle of the fore-head, I would take this Beaft for a Rhinocerot, but because the horn of the Rhinocerot groweth out of the nose, I deem this to be a second kinds of Unicorn; for there is no man that shall read this flory, but will think that the learned Author had reason to differn betwixt the eyes and the fore-head, and therefore there can be no exception taken

to my observation.

Niclam Venetue an Barl faith, that in Mafinum or Serica, that is, the Mountains betwirt India and Caba, (as Anem Sylvine writeth) there is a certain Beaft having a Swines head; an Over tail, the body of an Blephant (whom it doth not only equal in flavore, but also it liveth in continual variance with them) and one horn in the fore head: now this if the Reader shall think it different from the former, I do make the third kinde of the Unicorn; and I trust that there is no wife man that will be offended at it: for as we have shewed already in many stories, that fundry Beasts have not only their divisions, but sub-divisions, into sub-alternal kindes, as many Dogs, many Deer,

554

many Horses, many Mice, many Panthers, and such like, why should there not also be many Marimany Horfes, many Mice, many Pantiners, and happy his the fire they me better reason, (which come ? And if the Reader be not pleased with this, let him either flew me better reason, (which t know he shall never be able to do) or else be filent, lest the uttering of his dislike, bewray envy and

The History of Four-footed Beasts.

O her ditcourles of the boots.

Philes.

norance. Now although the parts of the Unicorn be in some measure described, and also their Countries. namelle India and Ethiopia, yet for as much as all is not faid as may be faid. I will add the refidue in name to And first of all there are two Kingdoms in India, one called Niem, and the other Lamthis place: And mile of are flored with Unicorns: And Aloftus Cadamuffus in his fifty Chapter of the Name found the Condition of t his Book of Navigation, writeth that there is a certain Region of the New-found World, wherein his Book of Navigation, writering the Baft, and South, under the Equinoctial there is a living are found live Unicorns; and toward the Baft, and South, under the Equinoctial there is a living are found live unicoting; and his crooked, and not great) having the head of a Dragon, and a creature (with one norn winell and and firetched out like a Serpents, the refidue of his body like to beard upon his chin, his neck long, and firetched out like a Serpents, the refidue of his body like to beard upon niscuin, his feet, colour, and mouth are like a Lions: and this alfo (if not a fable or a Harts, faving that his feet, colour, and mouth are like a Lions: and this alfo (if not a fable or a Harts, laving that his leet, fourth kinde of Unicorn; and concerning the horns of Unicorns, rather a Monster) may be a fourth kinde of Unicorns. rather a Montter) may be a louist, which is to relate the true history of them, as it is found in now we must person the start proming out of the fore-head betwixt. the eye-lids is neither light for hollow, nor yet smooth like other horns, but hard as Iron, rough as any file, revolved into nor nonow, nor yet mooth may dart, ftraight and not crooked, and every where black except at

e point. There are two of these at Venico in the Treasury of S. Marks Church, as Brasavolus weiteth, one at Argentarat, which is wreathed about with divers Spires. There are also two in the Treasury of at Argentaria, which is western as long as a man in his stature. In the year 1520, there was found the horn of a Unicorn in the River Arrila, near Bruga in Helvetia, the upper face or outfide whereof was a dark yellow, it was two cubits in length, but had upon it no plights or wreathings. It was very odoriferous (especially when any part of it was set on site) so that it smelled like musk: assoon as it was found, it was carryed to a Nunnery called Gampurejus, but afterwards by the Governor of Helvetta it was recovered back again, because it was found within his territory. Now the vertues of this horn are already recited before, and yet I will for the better justifying of that which I have said concerning the Unicorns horn, add the testimony of our learned men which did write thereof to Gefner, whole letters according as I finde them recorded in his work, fo I have here insetted and translated word for word. And first of all the answer of Nicholas Gerbelius unto his Epistle, concerning the Unicorns horn at Argentum, is this which followeth, for, faith he, The horn which those Noblemen have in the fecrets of the great Temple, I have often feen and handled with my hands; It is of the length of a tall man, it lo be that you shall thereunto add the point thereof : for there was a certain wil disposed person amongs them, who had learned (I know not of whom) that the point or 190 of the fame horn would be a present remedy both against all poyson, and also against the Plague or Pestilence : Wherefore that facrilegious thref plucked off the higher part or top from the refidue, being in length three or four fingers.

For which wicked offence, both he himfelf was cast out of that company, and not any everafterwards of that family might be received into this fociety by an Ordinance gravely and maturely ratified. This pulling off the top brought a notable deformity to that most splendant gift. The whole horn from that which Ricketh to the fore-head of this beaft, even unto the top of the horn is illogether firm or folid, not gaping with chops, chinks or creviles, with a little greater thickness then a tile is usually amongst us. For I have oftentimes comprehended almost, the whole hern in my right hand. From the root unto the point it is even as wax candles are rowled together most elegantly k-

vered and raised up in little lines.

The weight of this horn is of fo great a massiness, that a man would hardly believe it, and it bath been often wondred at that a beast of so little a stature could bear so heavy and weighty a burden. I could never finell any sweetness at all therein. The colour thereof is like unto old Ivory, in the midst betwixt white and yellow. But you shall never have a better pattern of this, then where it is fold in little pieces or fragments by the Oylmen. For the colour of our horn is life unto them But by whom this was given unto that same Temple I am altogether ignorant.

Gerbellius. A fecond Hifory of a Unio corns born.

Another certain friend of mine, being a man worthy to be believed, declared unto me, that he faw at Paris with the Chancellor, being Lord of Praise, a piece of a Unicorns horn, to the quantity of a cubit, wreathed in tops or spires, about the thickness of an indifferent staffe (the compals there. of extending to the quantity of fix fingers) being within and without of a muddy colour, with a for lid lubstance, the fragments whereof would boil in the Wine, although they were never burned, having very little or no smell at all therein.

When Joannes Ferrerius of Piemont had read these things, he wrote unto me, that in the Temph of Dennia, near unto Paris, there was a Unicorns horn fix foot long, wherein all those things which are written by Gerbelim in our Chronicles were verified, both the weight and the colour: but that in bigness it exceeded the horn at the City of Assentante, being also hollow almost a foot from that part which sticketh unto the fore-head of the Beast, this he saw himself in the Temple of S. Per that part which sticketh unto the fore-head of the Beast, this he saw himself in the Temple of S. Per that part which sticketh unto the fore-head of the Beast, this he saw himself in the Temple of S. Per that part which sticketh unto the fore-head of the Beast, this he saw himself in the Temple of S. Per that part which sticketh unto the fore-head of the Beast and the saw himself in the Temple of S. Per that part which sticketh unto the fore-head of the Beast and the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the saw himself in the Temple of S. Per that part which sticketh unto the saw himself in the s A third Histonia, and handled the horn with his hands as long as he would. I hear that in the former year ty of a Unicorns horn.

(which was from the year of our Lord 1553.) when Vercella was overthrown by the French, there was horned to the hought from the transfer of was brought from that treasure unto the King of France, a very great Unicorns horn, the

price whereof was valued at fourscore thousand Duckets. Paulus Poeius describeth an Unicorn in this manner; That he is a Beaft, in shape much like a young Horse, of a dutty colour, with a Another dein this manner; trush and a fore-head armed with a horn of the quantity of two cubits, being feripion of maned neck, a hairy beard, and a fore-head armed with a horn of the quantity of two cubits, being feripion of the discounties and trush and trush or forces, which is reported by the smoothness and trush whiteness there. feparated with pale tops or spires, which is reported by the smoothness and Ivory whiteness thereof, to have the wonderful power of diffolving and speedy expelling of all venom or poylon whatfoever.

For his horn being put into the water, driveth away the poyfon, that he may drink without harm, if any venomous Beaft shall drink therein before him. This cannot be taken from the Beaft being alive, foralmuch as he cannot possibly be taken by any deceit : yet it is usually seen that the horn is found in the Deferts, as it happeneth in Harts, who cast off their old horn through the inconveniences of old age, which they leave unto the Hunters, Nature renewing another unto

The horn of this Beast being put upon the Table of Kings, and set amongst their junkets and hankets, doth bewray the venom if there be any such therein, by a certain sweat which cometh over it. Concerning these horns, there were two seen, which were two cubits in length, of the thickness of a mans arm, the first at Venice, which the Senate afterwards sent for a gift unto Sofines, the Tarkift Emperour: the other being almost of the same quantity, and placed in a silver pillar, with a short of cutted point, which Clement the Pope or Bishop of Rome, being come unto Maffelt, brought unto Francis the King for an excellent gift, Furthermore concerning the vertue of fuch a gift, I will not speak more of this Beast, then that which divulged same doth perswade the

Peris Bellonius writeth, that he knew the tooth of some certain Beast in time past, fold for the Of adulterated horn of a Unicorn, (what Beaft may be fignified by this speech I know not, neither any of the Unicorns French men which do live amongst us) and so a small piece of the same being adulterated, fold some-borns. times for 300. Duckets. But if the horn shall be true and not counterfeit, it doth notwithstanding feem to be of that creature which the Ancients called by the name of a Unicorn, especially Alianu, who only aftribeth to the same this wonderful force against poylon and most grievous dileases . for he maketh not this horn white, as ours doth feem, but outwardly red, inwardly white, and in the

midt orfecretest part only black.

But it cannot be denyed, that this our Unicorns horn was taken from some living wilde Beast. For there are found in Europe, to the number of twenty of these horns pure, and so many broken two of the which are thown in the treasury of Saint Marks Church at Venice, (I heard that the other was offate fent unto the Emperor of the Turks for a gift by the Venetions) both of them: about the length of fix cubits: the one part which is lowest being thicker, and the other thinner, that which is theker, exceedeth not the thickness of three inches just, which is also attributed unto the horn of the Indian Als, but the other notes of the fame are wanting.

I doalfo know, that which the King of England possesseth to be wreathed in spires, even as that accounted in the Church of S. Dennu, then which they suppose none greater in the world, and I never swany thing in any creatures more worthy praise then this horn. The substance is made by nature, not Art, wherein all the marks are found which the true horn requireth. And for somuch as it is fomewhat hollow (about the measure of a foot which goeth out of the head, and the bone growing from the same is comprehended) I conjecture that it never falleth, as neither the horns of a Muske cat, a wilde Goat, and an Ibex do ; but the horns of these beafts do yearly fall off, namely, the Buck, the Hart, Field-goat, and Camelopardal. It is of fo great a length, that the tallest man can scarsely touch the top thereof, for it doth fully equal feven great feet. It weigheth thirteen pounds with their affize, being only weighed by the guess of the hand, it seemeth much heavier. The figure doth plainly signific a wax candle, (being folded and wreathed within it self) being far more thicker from one part, and making it felf by little and little less towards the point, the thickest part thereof cannot be thut within ones hand, it is the compass of five fingers, by the circumference, if it be measured with a thread, it is three fingers and a span.

That part which is next unto the head hath no sharpness, the other are of a polished smoothness. The splents of the spire are smooth and not deep, being for the most part like unto the wreathing turnings of Snails, or the revolutions or windings of Wood-bine about any Wood. But they proend from the right hand toward the left, from the beginning of the horn, even unto the very end. The colour is not altogether white, being a long time fomewhat obscured. But by the weight it is an easie thing to conjecture, that this Beast which can bear so great burden in his head,

in the quantity of his body can be little less then a great Ox. There are found oftentimes in Polonia certain horns which fome men guess to be of the Unicorns, Of the Uniby a double argument. First, because they are found several, never by twains which as yet is heard, corns hours although sometimes they may be found with the skull and bones of the rest of the body: furthernia. more, because their strength or vertue is approved against great and most grievous diseases: concerning which thing Antenius Schnebergerus, a Physitian of great learning amongst the Sarmatians, and an excellent observer of nature, writ unto me some five year past, to see some of these horns, having seement observer of nature, writ unto me some five year past, to see some of these horns, having seement observer of nature. ving fent them by the labour of my very good friend Joachinnus Rhaticus, a most excellent Physician in Sarmalia, and incomparable in the Mathematick Arts in this age.

The first of these horns (saith he) I saw being of the length of my sadom, with a duskish or darkish colour : the point thereof being exceeding sharp and smooth. The compass about

The History of Four-footed Beasts.

the root of the horn did exceed fix fpans. The outfide was plain, with no turnings of fpires; the the root of the norn and exceeding plans. The colour exceeding white within; which if it be fubfiance easie to be crumed, the higure crooked, the colour exceeding white within; which if it be fubitance eatie to be crumeu, entengure croncel. Eight fuch divitions were joyned to the lime drunk in Wine, doth draw over it felf a dark colour. Eight fuch divitions were joyned to the lime. as you shall fee in the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend, but that part is not of the horn, but either the greater part which I fend trance of the palar, or fome other things as I conjecture.

ance or one paint, or lone other than a foot, in a folitary and high place, as he. Inis norn was found under the River ranneth) by Countrey-men that were digging to lay the tween two mis, through which a Arte with an Ax, and fevered into very small pieces. thandation of a house. But the norn was minten with an Ax, and revered into very mail pieces; that noble and excellent man Jodines Frikajk (in whose field the horn was found, being diffair than that noble and excellent man Jodines Frikajk (in whose field the horn was found, being diffair thom Oracovia two miles) by 41 diligence he tould, left that the finall pieces thould be call about the foot to the top it was took deliberate need, that they should be taken out of the earth. From the root to the top it was took deliberate field, the control of the contr all round and smooth, but touching it with ones tongue, it cleaveth fast unto it, the tooth was in the all round and imooth, but touching in the apper or outward part bony or hollow within, white

in the middle, and toward the end formewhat reddiffimathe middle, and toward the Beaft, as by the greatness of his bones might early be perceived be. and there was round and the Bears, a tris most certain that it was a four-footed Beart, by the bone ing bigger in quantity then a Horfe. It is most certain that it was a four-footed Beart, by the bone of the shoulders, thighs and ribs. But if this horn were the tooth of an Elephant, as some to sup. of the mountain, tinguismouth of which I have heard) were never found together. But thereh or rather horns of Elephants are intither to crooked that they might come almost to half a sich or rather norms of the firength of this horn a penny weight thereof being put in Wine or water of Bo. rage, healeth old Fevers, as also tertian or quartern Agues of three years continuance, and with many diseases in mens bodies, as asswaging the pain of the belly, and making of those to vomit, who can by no means ease their stomacts. Hitherto shall suffice to have spoken concerning one of who can by no means care that tomach was like unto this, but less pure, for the tolour was owned those four horns which I saw. The other was like unto this, but less pure, for the tolour was owned by most black, inwardly most white being found in the River The third, and fourth most had fo that a man would think it were by the couching thereof from of iron, being folid even who the point, for I have not feen them wholly, but the part of one, to the length of a cubit; of the other, to the length of half a cubit, with a dark colour, being almost of the same thickness as the two former : But forasmuch as the two former have no rifts or chinks in them, these have by their longi-

mer: Dut foramuch as the two former have no fines of chinas in them, there have by their longitude, being like herbs bending of wreathing in their stalks.

There was another found in a certain field, so much appearing out of the earth, that the rule or Countrey sort did think it to be some pile of stalks. Many also are cured and freed from hising or Countrey for thick think it to be some pile of stalks. There is no cured and freed from his freed to the charge with the charg are fofter, for as much as one of them will ly in the water for lo long a time, but the otherwider the earth being scarfe well hid. I afterwards faw a fifth like time the first, more of them being fraight or direct up, but also crooked, some almost with a half circle : Hitherto Schnebnight, who aifb addeth this: That there are more of there to be found in Polonia, and therefore for the most

part to be contemned. .

There are moreover found in Helvetia forme of thefe horns: one in the River Aidlagaing the Town of Bruge, the other in the last year, in the River of Birle, but it was broken, even as the third with that fathous Earl of the Combrians, William Warner in a Tower near unto the City Rangin, who gave unto Gefrer a good piece thereof, who found another piece as he was a filling at Brid in the River. And it is no great marvail that they are found there, where through length of time ties, are

broken into small pieces, and carryed by the force of the waters into divers places.

But it is most diligently to be observed, whether they are found in the earth, as also to be known whether that great horn be of this beaft, which hangs alone in the great Temple at Argenium, by the pillar, for it hath hanged there many years before, as now it appeareth, for that doth plainly feem the fame magnitude, thickness, and figure which Schnebergerw hath described in his own horn, that we have allowed before for wilde Oxen. The Ancients have attributed fingular horse to the Unicorn, whom some have cald by other names as it is said : and furthermore to the Oryx (a wide Beatt unknown in our age except I be deceived) which Ariffelle and Pliny call a Unicorn, Edans a Quadrucorn. Oppianus doth not express it, but the seemeth to make it a two horned Beath. Simon Sethis doth also write, that the Musk-cat or Goot which bringeth forth Musk, hath one horn Certain later writers (as Scaliger reporteth) fay, that there is a certain Ox in Ethiopia which hath one born coming out in the midst of his fore-head, greater then the length of a foot, bending up wards, the point being wreathed overthwart, and they have red hair, whereby we gather that the horn of all Unicorns is not pure. But the reason why these horns are more found in Public, then in any other place, I cannot well guess, whether from thence we shall suspect them to be of certain Wries, which at this day abide in the Woods of Sarmatia; in times past, there were maky more, which have lived both in greater and larger Woods, neither were they killed with fo often hunting. fome whereof it is most like have come to great age, as appeareth by their great and stately hors, which things we leave to be considered of others. I suppose that the Apothecaries never have the true horn of a Unicorn, but that fome do fell a kinde of false adulterated Horn, other the fragments of this great and unknown horn, of which we have spoken, and not only of the horn, but allo of the horn, but all of the horn, b bones of the head; some of which are so affected by longinguity of time, that you may take a thirtfold substance in them, although it be broken by a certain distance, one being for the most part with and hale shooth much be broken by a certain distance, one being for the most part with and hale shooth much be broken by a certain distance, one being for the most part with and hale shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance, one being for the most part with the shooth much be broken by a certain distance. tifh and pale, the other whiter and fofter, the third ftony and most white. I heu

I hear that in the new Islands there was a horn bought in the name of a Unicorns horn, being much praifed for expelling of poyson: which what it is I have not as yet examined, but it is to be inquired, whether it be Rhinocerots or not, for both the ancient and late Writers do mingle this with the Unicorn. I do verily conjecture that the same strength is pertinent to both the

Of the Unicorn.

And thus much shall suffice concerning the true Unicorns horn, and the Vertues arising therefrom. In this place now we will proceed to the refidue of the history, referving other uses of this

horn to the proper medicines.

These beasts are very swift, and their legs have no Articles. They keep for the most part in the The natural Deferts, and live folitary in the tops of the Mountains. There was nothing more horrible then the properties of voice or braying of it, for the voyce is strained above measure. It fighteth both with the mouth and with the heels, with the mouth biting like a Lion, and with the heels kicking like a Horse. It is beaft of an untamable nature, and therefore the Lord himself in Job saith, that he cannot be tyed with any halter, nor yet accustomed to any cratch or stable. He feareth not Iron nor any Iron infrument, (as Isidorus writeth) and that which is most strange of all other, it fighteth with his own kinde, yea even with the females unto death, except when it burneth in lust for procreation ; but unto stranger-beasts, with whom he hath no affinity in nature, he is more sociable and familiar, delighting in their company when they come willingly unto him, never rifing against them, but proud Philes. of their dependence and retinue, keepeth with them all quarters of league and truce, but with his Elianus. female, when once his flesh is tickled with lust, he groweth tame, gregal and loving, and so continueth till she is filled and great with young, and then returneth to his former hostility. He is an enemy to the Lions, wherefore assoon as ever a Lion seeth a Unicorn, he runneth to a tree for succour, that so when the Unicorn maketh force at him, he may not only avoid his horn, but also defroy him; for the Unicorn in the swiftness of his course runneth against the tree, wherein his sharp horn flicketh fast, then when the Lion feeth the Unicorn fastned by the horn, without all danger he falleth upon him and killeth him. These things are reported by the King of Elbiopia, in an Hebrer Epistle unto the Bishop of Rome.

It is faid that Unicorns above all other creatures, do reverence Virgins and young Maids, and The taking of at many times at the fight of them they grow tame, and come and fleen helide them, for there that many times at the fight of them they grow tame, and come and fleep befide them, for there is in their nature a certain favour, wherewithal the Unicorns are allured and delighted : for which occasion the Indian and Æibiopian Hunters use this stratagem to take the beast. They take a goodly Albertus. frong and beautiful young man, whom they dress in the apparel of a woman, besetting him with Alunness.

divers odoriferous flowers and spices.

The man to adorned, they fet in the Mountains or Woods where the Unicorn hunteth, fo as the windemay carry the favour to the beast, and in the mean season the other Hunters hide themselves : the Unicorn deceived with the outward shape of a woman and sweet smells, cometh unto the young man without fear, and so suffereth his head to be covered and wrapped within his large sleeves, never stirring but lying still and asleep, as in his most acceptable repose. Then when the Hunters by the fign of the young man perceive him fast and secure, they come upon him, and by force out off his horn, and fend him away alive: but concerning this opinion we have no elder authority then Tzetzes, who did not live above five hundred years ago, and therefore I leave the Reader to the freedom of his own judgement, to believe or refuse this relation; neither was it fit that I should omit it, seeing that all Writers since the time of Tzeizes, do most constantly be-

It is faid by Ælianus and Albertus, that except they be taken before they be two years old they will never be tamed; and that the Thracians do yearly take some of their Colts, and bring them to their King, which he keepeth for combat, and to fight with one another: for when they are old, they differ nothing at all from the most barbarous, bloudy, and ravenous basts. Their fiesh is not good for meat, but is bitter and unnourishable: And thus much shall suffice for the natural story of the Unicorn; now followeth the medicinal.

The Medicines arifing from the Unicorn.

Concerning the horns of the Unicorn, I have sufficiently already written, as the Antients have delivered in their remedies: but in this place I will handle the remedies which late Writers have attributed thereunto, as also our own observations of the same. I remember that in times past, I saw a piece of this horn of the weight of nine Inches, with a certain Merchant in the market, being black and plain, and not wreathed in circles or turnings, but at that time I did not so much observer it. Now amongst our Apothecaries I do not not only finde small or little frag-ments out of which there issued (as they say) some certain marrow, which are rounder, whiter,

But both the same colour, as also the substance being put too much, and eaten, if it be easily crummed, and not stuft as other horns, doth signifie the same not to be good or perfect, but counterfeited and corrupted : as perhaps the hord of some other beast burnt in the fire, some ceruin sweet odors being thereunts added, and also imbrued in some delicious or aromatical persume; peradventure alfo Bay by this means, first burned, and afterward quenched or put out with certain weet smelling liquors. There is great care to be had, that it butaken new, and while it smelleth

fweet, not either abolished by age, nor the vertue thereof diminished by often or frequent cups.

For rich men do usually cast little pieces of this horn in their drinking cups, either for the prevent-For rich men do ulushy can little pieces of this are also some which inclose it in gold or fiver, and ing or curing of some certain disease. There are also some which inclose it in gold or fiver, and ing or curing or tome certain uncare. Another could remain many years, notwithstanding the continual foaking in Wine.

ntinual loaking in vyine.

But that which is fo used and drunk in Wine doth bring upon it a certain dark or obscure colour. the whiteness which before remained upon the same being quite lost, expelled and utterly abolished Most men for the remedies arising from the same, command to use the horn simply by it self: Most men for the remedies arising from the cast in Wine doth boil, which some men either through Others preser the marrow therein. It being cast in Wine doth boil, which some men either through ignorance or deceit, impute to be a fign of the true horn, when as contrarily any other horns being burnt, do in water or wine cause bubbles to arise. There are some wicked persons which do make a mingle mangle thereof, as I faw amongst the Venetians, (being as I hear fay, compounded with lime and sope) or peradventure with earth or some stone: (which things are wont to make bubbles

arise) and afterward sell it for the Unicorns horn.

wherefore it shall be more safe to buy it out of the whole horn if it may be done, or of greater crums, and which may well describe the figure of a horn; then small fragments where you may receive less deceit. A certain Apothecary which was at Novemberg, in a stately mart Town amongst ceive leis deceit. A ceitain Apolitically in the Gymans, declared the way unto me how to deface the colour of an adulterated Unicorn horn, the Gymans, declared the way unto me how to deface the colour of an adulterated Unicorn horn, being made by fome with Ivory, either macerated or boiled with certain medicines (by Set-foil as I suppose, and other things) by which means having scraped it, I sound within the true substance to be Ivory. Antonius Brajavolus writeth, that all men for the most part do sell a certain stone for Unicorns horn: which truly I deny not to be done, who have no certainty therein my felf: notwithstanding also it may to come pass, that a very hard and solid horn, about the point of asword especially (which part is preserved to inferior, as also in Harts horns) to which either stones or iron may yeild, fuch as Authors attribute to the Rhinocerot. And other Unicorns may bear the shape of a stone before it fels. For if Orphess concerning Harts horns rightly doubted, whether the same or nones were of greatest strength: I think it more to be doubted in the kinde of Unicorns, for the horns of Harts are not only solid (as Aristotle supposed) but also the horns of Unicorns, as here

The horn of an Unicorn is at this day used, although age or longinquity of time hath quite abolished it from the nature of a horn. There are some which mingle the Rhinoceros with the Unicorn. for that which is named the Rhinoceros horn, is at this day in Physical use, of which notwithstanding the Authors have declared no effectual force. Some fay that the Unicorns horn doth sweet. having any poylon coming over it, which is false, it doth perhaps sometimes sweat, even as some folid, hard, and light substance, (as also stones and glass) some external vapour being about them,

but this doth nothing appertain to poylon.

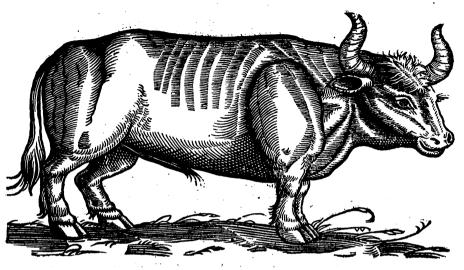

It is in like manner reported, that a kinde of stone called the Serpents tongue doth sweethaving poyson come over it. I have heard and read in a certain book written with ones hands, that the true horn of a Unicorn is to be proved in this manner. To give to two Pigeons poylon (red Arfack or Orpin) the one which drinketh a little of the true Unicorns horn will be healed, the other will die, I do leave this manner of trial unto rich men. For the price of that which is true, is reported at this day to be of no less value then gold. Some do sell the weight thereof for a floren, or eight pence: some for a crown, or twelve pence. But the marrow thereof is certainly of a greater price, then that which is of harder substance. Some likewise do sell a dram thereof, for two pence half penny, fo great is the diversity thereof. For experience of the Unicorns horns to know whether it be right or not : put filk upon a burning coal, and upon the filk the aforesaid horn, and if so be that it be true the filk will not be a whit confumed.

The horns of Unicorns especially that which is brought from new Islands, being beaten and drunk in water, doth wonderfully help against poyfon: as of late experience doth manifest unto us and, who having taken poy fon & beginning to swell was preserved by this remedy. I my self have heard of a man worthy to be believed, that having eaten a poyfoned cherry, and perceiving his belly to swell, he cured himself by the marrow of this horn being drunk in Wine, in very short space.

The same is also praised at this day for the curing of the Falling sickness, and affirmed by Ellanne who called this difease cursed. The ancient Writers did attribute the force of healing to cust made of this horn, Wine being drunk out of them: but because we cannot have cups, we drink the subflance of the horn, either by it felf or with other medicines. I happily fometime made this Sugar of the horn, as they call it, mingling with the same Amber, Ivory dust, leaves of gold; coral, & certain other things, the horn being included in filk, and beaten in the decoction of Raifins and Cinamon, I can them in water, the rest of the reason of healing in the mean time not being neglected. It is moreover commended of Physicians of our time against the pestilent seaver, as Alossus writtens against the bitings of ravenous Dogs, and the strokes or poysonsome stings of other creatures; and privately in rich mens homes against the belly or maw worms to conclude, it is given against all poyson whatsoever, as also against many most grievous diseases. The King of the Indian Unicorns horn, and being asked wherefore he did it, whether it were for the love of drunkenness made answer where her drinks drunkenness was both expelled for the love of drunkenness, made answer, that by that drink drunkenness was both expelked and refifted, and worfer things cured, meaning that it clean abolished all poylon whatform. The horn of a Unicorn, doth heal that detestable difease in men called S. Johns evill, otherwise the

Of the Ure-ox. curfed disease. The horn of an Unicorn being beaten and boiled in Wine, bath a wonderful effect in making the teeth white or clear, the mouth being well cleanfed therewith. And thus much shall fuffice for the medicines and vertues arifing from the Unicorn,

Of the URE-OX

This beaft is called by the Latines, Urus; by the Germans, Aurox, and Urox, and Groffe vefent; by The leveral the Lituanians, Thur; the Southians, Bubri; and these beatts were not known to the Grecians, names, (as Pliny writeth) of whom Seneca writeth in this manner;

> Tibi dant varia pellora Tigres, Tibi villoft terga Bisontes, Latifq; feri cornibus uri.

And Vigil also maketh mention of them in his Georgicks, writing of the culture or tilling of

Texenda supes estam & pecus omnie tenendum: Pracipue cum frons tenera, imprudenfe ; laborum, Cui super indignas byemes, folema; potentem,

Silveftres uri affidue, capreaq; fequaces

These wilde beasts or Ure-oxes are wilde Oxen, differing from all other kindes, already rehearsed in the flory of Oxen, Bugles, Bisons, or any other, although some have unskissully taken them for Bisons, and Sir Thomas Elios in his Dictionary, doth English True a Bugil, but beside him no body, that I know, and for this cause he is reprehended by other. Now although there be nothing in this best has adjusted to the control of the c beaft but ordinary, yet seeing it is a creature so well known, we have less reason to omit his shape and story, lest we should justly be condemned of negligence and carelesness.

In outward proportion of the body it differesh little from the Bull, It is very thick, and his back The several

somewhat bunched up, and his length from the head to the tail is short, no ways answerable to the Paris. proportion of his stature and sides: the horns (as some say) are but short, yet black, broad, and thick, his eyes red, a broad mouth, and a great broad head, his temples hairy, a beard upon his chin, but flort, and the colour thereof black, his other parts, as namely in the face, fides, legs, and tail,

These are in the wood Hercinia, in the Pyriney Mountains, and in Magovia, near Linguist Places of their These are in the wood Hercinia, in the Pyriney Mountains, and in Magovia, near Linguist Places of their They are call'd Uri of Orin, that is the Mountains, because their savage wildeness is so great, that abode: they seldom descend from those safeguards. They far excel Bulls, and other wilde Oxen, coming nearer to the quantity or stature of Elephants, then to the Bull. In resemblance a man would think them to be compounded of a Mule and a Hart, for their outward resemblance so seem, It is said they could never be sales by man although they were taken when they were It is faid they could never be taken by men, although they were taken when they were

. 141.

their breed.

young, yet they love other heards of Cattel, and will not forfake them eafily after they have once young, yet they love other nearus of Catter, and will stress they are deceived and killed, twenty, thirty, or forty at a time. Caligula Cafar brought of these alive to Rome, and did shew them in publick or forty at a time. Cangula occupies brought by were taken for wilde Bulls. Some affirm that there Countries of spectacle to the people, and at that time they were taken for wilde Bulls. Some affirm that there spectacle to the people, and at that they are so wilde, cruel, and untamable, as they fear or spare are of these in Prussa, and that they are so wilde, cruel, and untamable, as they fear or spare are of there in Frague, and when they are set upon and wounded by the Hunters in the Woods neither man nor beait; and when they are let upon and woulded by the runters in the Woods among the trees, feeling their hurts, and perceiving their bloud ifluing out of their body, they rage above measure; for having no means to take revenge upon the Hunter, by reason that he standard forme great tree, for very wrath and sury they kill themselves with their own head-standard formers. This said that their forcheads are so broad and large shown itandeth beninde ionie great tree. It is faid that their foreheads are fo broad and large, that two men may easily fit betwixt their horns. They are able to take up an armed man and his Horse, and to may earnly no Detwint their north, and the heads of these or such like beasts are to be seen publiquetotle him into the air like a Dull, and the sand Wormes, which are worth the observation, because in ly fixed up in common places at Menix and Wormes, which are worth the observation, because in all proportion they are twice so big as the vulgar Bull or Oxe.

The History of Four-footed Beasts.

Now although their large bodies and manes do also appertain to the Bisons, yet it is not unfitto attribute the same also to the Ure-oxe. For if it be in the pleasure of any man to make it also a attribute the lame and to the deny that this must be remembred, that both the body of this bealt is

much larger, and also the aspect not so grim or fierce as is the Bison.

There are many of these sound also in Angremannia, and the Confines of Lapponia, and other Northern parts of the world, where they are called by the Illyrian term Zubrones, and thefe are fo high as a tall man can hardly lay his hand upon the top of their backs, although he train himfelf

Very much.

And some of them are fifteen cubits in length, of whom, beside their admirable strength, their velocity and nimblenesse is also remarkable, for it is said of them, that when they empty their bellies, they can turn about to take their dung or excrement upon their horns before it fall to the ground, which they cast upon the Hunters or pursuers, Dogs or men, whereby they blinde and burn them. They which accustome or practife to kill and hunt these beasts, are greatly commended and rewarded when they have killed many of them, whereof they make proof, by bringing thehorns of them that they have killed into the common Market-place.

In ancient time before the invention of Iron weapons, they did take them in those Countreys in ditches, and great caves of the earth, whereunto the strongest and most active young mendid aoply themselves, having both Dogs and all other needfull instruments to take away the life of this beaft; and if it did not happen that he fastned his horns into some tree, then was all their labour loft, for they could never come neer to touch him, only when in his speedy swift fury among the woods, he ran his horns into the body of some Oaks or such like, whereby he was stayed, sforit is not fo easie to pull them forth as to fixe them, because they are rugged, crooked, and standupward) then he was overtaken and killed by some Hunter or other. And if at any time he met with a Hunter, it was fatall and deadly to the man, except he could avoid the beaft by getting unto

Sigismundus Baro, that honourable man writeth thus hereof, that in Malonia neer Lituatio, it is bred, and called Thur, and they are a kinde of wilde Oxen, not differing from the vulgar, (except as aforesaid) but in their colour, and a spotted strake or line which goeth all along their backs. And those Ure-oxen are kept as it were in Parks and Chases, having a peculiar designment by the King, and the inhabitants of certain Villages to keep and watch them. Sometimes when they meet with a common or vulgar tame Cow, they leap upon her, and fill her; but such a Calf liveth not long, but dyeth as if it were not perfect, and if it do chance to live, it never resembleth the sire, nor yet is admitted into their fociety and herd, but are refused for bastards and ignoble breed. And when he was Ambassador to Sigismundus the Emperour he received for a gift one of these killed, and bowelled, having the skin of the forehead cut off and taken away, whereat he wondred much but durst not ask the question or reason thereof, yet afterward he understood that there were girdles made of that part of the hide, whereby the women in that Countrey were perswaded that they should be made apt to conceive and bring forth children: and Bona the mother of Steffmander gave unto him two girdles for that purpose, whereof he said he bestowed one upon the Queen of of Romans, who did take the same at his hand very graciously and thankfully. And it is certain, that out of the hides of these beasts are made girdles, which are two fingers thick, and strong, and yet the hair upon them is fost and gentle like any Wooll.

The flesh of these beats is rank and heavy, and if it be eaten fresh it causeth looseness, but if it be falted a day or two it is nothing inferiour to Beef, for fo the humidity is taken away. With the horns are made drinking Cups, and for that purpose the richer fort of people do edge or lip them over with silver and gold: they hold or contain as much as two ordinary Pitchers of water. Other the people do edge of the people take off the points and fasten them to spears, being very sharp, and not easily blunted or broken, and other make of them cut into flices or panes the belt Lanthorns in the World. And thus made for the Ure-ox, unto whose History it is needfull for me to adde the fory of divers other wide

Oxen not vet described.

Strabo faith, that there are Oxen called Rhizes, among the Heferian Ethiopians, who in outwid proportion are much like the vulgar Bulls, but in other parts, as quantity, ftrength, and vigor, comparable to the Elephants.

Theuetus writerh, shat betwirt Florida and Palina, in the new found World, there are very many france thaped boatts, and among other a kinde of wilde Bull, whose horns are a foot long, but on his back he hach a tumout or bunch like a Camel, and is therefore called Bos Gamelits, his hair all over his body is very long, but especially under his chin, and this colour like a vellow Mule. and this beaft is a continual enemy son Horfe. Like unto thefe are the tame Southin Oxen, and fome other in Afte, willo carry packs upon the bunthes of their backs, and also bend their knees like Camels

Of the Lybian OX E. the Husters are thany times debeived in hunting them, and so do certainly chance or fall upon other wilde beatla sor! the same they raised, and he in the mean while doth hide himself in a place of brambles and briars, keeping himself there lafe, while other wilde beats doth appear like unto them, and fo do deterve the eyes of the Hunters : therefore if any man do begin to follow after sither of them, in will be but labour loft, for he is not able to comprehend or attain them with a Horse, except he may take them being wearied by longitude of time. But if any Hunters shall finde a young Calf, spare the life thereof, and shall not presently kill it, he shall reap a double profit by it : and first it doth bring profit to it self, and doth induce or lead his Dam into captivity. For after that the Hunter hath bound the Caif with a rope, fhe being inflamed by the love or affection which she beareth to her Calf, returneth back again unto it, coveting with an ardent desire to loosen and take away her Calf out of the bond or halter, therefore she thrusteth in her horn to look and take away not can out of the bond of natter, therefore the thankets in her north that the may too for the cord, and pluck her young one away, whereby the is kept fast bound with her Calf, her florid being intanged in the rope. Then cometh the Hunter and killeth her, and Elianus. Then for the liver, and also cutteth of her dugs or udder, and doth likewise plock off her skin, and leavesth her flesh for the Birds and wilde Brasts to feed upon. There is smoother hinde of Ox in and leavest nor ness for the Bires and wilde Beatte to reed upon. There is mother sinde of Ox in Libia, whole horns do bend downward, and for that caule they are fain to feed going backwards. Of the layings of Hepadotm and Elimin. I have fooken before. Philes doth write; that they are an lad oxen going backward, becaule the broadness of their horns doth cover their tye light, when at the same that them in no use to go forward, but is very commodious to go backward. There is an one which liveth in the Woods of Africk, which doth resemble a domestical Oxe, yet lesse in the unique of the desert. Their and the last found in the deserts, Leo African. orinthe Marches or limits of the deserts. Their flesh is also of a persect or absolute savour and tale, good for the nourishment of men.

Of the Indian wilde OXEN.

The horns of the Oxen of the Garamanions do grow downwards toward the earth, and there Pliny. forewhen they feed they bowithe hinder part of the neck, (as Solinus writeth) and as we have spoken before in the diversities of wilde Oxen. The Woods also in India are filled with wilde Oxen. In the Province of India where the Gymnin inhabit, are great multitudes of Oxen which live in the Forrests or Woods. In the Kingdoms which are upon the borders or confines of India, (in the Strabo, mid of the day) are many fair and great Oxen which live in the Woods. There are Mountains in Strabo. the inmost Regions of India, which are very hard to come unto, where they say live those beasts wilde, which are among us domesticall and tame, as Sheep, Goats, Oxen, and fo forth. The great King of India doth elect or choose a day every year for the runnings and combats of men, and also fightings of Beafts; who fetting their horns one against another, do fight irefully with admirable rage, untill they overcome their adversaries. They do also labour, and strive with all their nerves Elianus. and finewes, even as if they were Champions, or fought for fome great reward, or should get honour by their battell.

Wilde Bulls, tame Rams, Asses with one horn, Hyenaes, and lastly Elephants, as if they were capable of reason, they wound them among themselves, and the one doth oftentimes overcome and kill the other, and sometimes fall down together being both wounded. I have also recited beforein another place of the intreaty of Oxen, those Indian Oxen which are faid to be most swift in their joynts in running to and fro, when they are at combate, because there we had not diftinguished whether these were wilde Oxen or not : but it doth appear in this place, that they are wholly taken for wilde Oxen: and the thing it felf doth manifelt that domeffical! Oxen are not fo fwift nor

The Oxen in India have altogether whole hoofs, and also but one horn. Æthiopia also doth Pliny. breed Indian Oxen, that is to fay, Oxen that are like to those of India, for some have but one horn, and other some three. Solinus faith, that there are found in India some Oxen which have but one horn, and othersome which have three horns, with whole hoofs and not cloven. The Indian Ogen are faid to be as high as a Camel, and their horn four foot broad. Ptolemens doth report, that he aw a horn of an Indian Oxe which did hold in the breadth of it thirty gallons.

Use of their

Sant Harle & Some

Ariftotle.

There are also Oxen which are bred in India which in greatnesse are no bigger then a Buck, or Goat, they do run yoaked together very fwift, nor do end their race with leffe speed then the Goat, land Horses, and I did not take them to be Oxen living in the Woods; for our Rangistrand Oxen which live in the Woods, age the swiftest of all beasts in this kinde, and most apt to combats Oxen which here in the vy 0013, Bre the livingtone horn, and parely Oxen having one horn, and parely Oxen having three and runnings, and they may parely be called Oxen having one horn, and parely Oxen having three and runmings, and they may some sendinavia, but also in other Regions and Dominions of Afaits norns: nettuer are they round in oranamana, our and Solinus doth not rightly call those Indian we believe that Indian Oxen are of the fame kinde. Solinus doth not rightly call those Indian Oxen, which Elianus calleth Ethiopicos, as I have declared above in the flory of the Ethiopian Oxen, for their horns are moveable. Clefias doth write, that there are fprung up among the same beafts, that beaft which is called Mantichora: which is manifested by Aristotle in his History of Pourbeauts, that beaut which is cancel and others have not confidered this error. Among the Arecotans there are Oxen which live in the Woods, which do differ from those that are bred in the City, sas much as wilde Swine from tame. Their colour is black, bending a little downwards, and their much as wilde Swine from tame. horns broad and upright. There is a City in India called Arachous, taking the name from the Richards ver Arachotus, which doth flow out of Couldows, what those beafts are which do bend their horns ver Arangum, which ared in the flory of the Bifon; for as there may be spoken something concerning the difference of the Plants of the Woods, for also concerning the beafts that are bred in the City, and those that are bred in the Woods. males our Call former in San and the territories of I also from the singlest

The History of Four-footed Beasts.

"Here are divers kindes of Weasels, but in this place we do intreat of the least kinde, whose form and shape we have also here set down. It is likewise properly named of the Latines, Mustela, a Weasel, for so we were wont plainly to name those which were common and domesticall, and to adde names to those which are more seldome seen, or live in the Woods for difference

The word Chold in Levit. 11. is translated a Weasel of all Interpreters. The Rabbin do call them Chuldah, and commonly Mustela, as David Kimhi writeth. The Chaldeans do translate it Chulda, the Arabians Caldab, the Perfians Gurba, and Hieron. Muftela. Oach is an Hebrew word, whereupon it was once called Ochim, plurally in Ifai. 13. Babylon subvertetur, & implebunt donnt terum Ochim, Munsterus cercopithecor vertit. That is to say, Babylon shall be overthrawn, and their bouses shall be filled with Ochim, that is, Weafels, but Munfterm doth call them Munkeys. David Kimbi, and the Master of Thalmud, do call it Nemiab, that is, like to a Cat, but commonly they call it a Marin, or Firmy, and Furon. The Authors of the Concordances of the Hebrewes, do interpret Koph, Cirolithecum, or Cephum, and Cullab, that is to fay, Mustela, a Weasel, as the Jewes do think: The Challe hath translated a Martin Ochijn. Symmachus also hath left or forsaken the Hebrew word. Aquile doth translate it Typhones, that is, a Whirle-winde, Hieronymus doth translate it Draco, that is, 2

Road is truly interpreted to be a kinde of Lizard, or a Chamelion; in Leviticus II. We also read in Albertus, His, and Hyrzus, (two barbarous words) for a Weafel, which he himselfdoth nor understand: but I have discerned or taken this signification out of the words of Aiffale; for Albertus doth most unlearnedly expound Hircum a Hare, being deceived, because both the living beasts do oftentimes remove their young ones from one place to another in their mouths. Fally allo doth feem to be according to Aristotle, no other thing then Gele, that is to say, a Wessill. For Feyton (faith he) it hath wit like a Fox, that is to fay, in fetting upon Hens or Chickins, and the other shape and form of it is Katiz, that is to say, Idia, a Ferret. Namfitza also is even to this day called a Weasel among the Grecians. Ibanauge is also called a Weasel, Ibinuers is a little four-sooted beaft. Bellula also doth seem to signifie a Weasel, by a feigned word prodeeding from the French or Italians, which do call also Belettam, Balottampro Mustela, for a Weasel, but some of the later Greeian do about the first control of the later Greeian do about the second control of the later Greeian do about the later do abuse it, in terming it a Cat, as I have spoken before in the History of the Cat.

Theodorm Gaza in Ariftolle doth interpret it sometimes a Wealel, and other sometimes a Cat; neither can I sufficiently gather wherefore he doth so change it, seeing that the Grecians call Calism for a Cat Aeluron, and the Latines Felem. Some say, that Mustela for a Weasel hath been interpreted or declared of late dayes, being only led (it I be not deceived) with the affinity of the German word, for the Germans do call Mustela a Wifel. The Greeians do whilly take to this day Mustela for a Weafel, as I have read in the Oration of Suidas. A Weafel is called in Italy Donnels, or Ballottale, It is apparent by the words of Aviren, that Donnula, and otherwise Dannula is barbarously used pro Malles Scept. apparents of the which and Niphon do write Damula for a Weafel, by the which word, the later Writers do very obscurely understand Dama for a Weasel, which is of the kinde of Goats living in the Woods. Damma or Dammula is a small and weak beaft, (as Indorus writeth) speaking of those that are wilde, and will not come to hand. When it doth bring forth young, it doth presently de-your the Seconds or those that come after birth, before they touch the earth, and yet it is a prey Albertus. is felf to other Four-footed beafts. You may also feem to take a little Dear, or a kinde of young Gost, or a Wealel, for that kinde of beast which dorn deyour her Seconds; But we read that neither of these do it.

either of these do it.

The Lizard is said to devour her first litter which she littereth in her old age. We also call Domesticall Weafels, Foines. A Weafel is, called in France, Belotte; or Belotte, and Albalotte. Some as I do hear, which do inhabit about the Towns of Meta, do call them Baccal. Garolus Figult doth interpreta Weasel in French, Fovinum, or Marurellum, of which I have showed before that there is two kindes, and also that there are Weasel's living in the woods. In Spain also they are called Coma deia, The people of Rheita which speak Latine, do keep the Latine name. The Germanic do call them Wifel or Wifele. Georgius Agricola saith, that it is called a Weasel by reason of the noise that it maketh. Othersome dwelling in Helvetia, do call it Hermelin, and some do call it by a corrupt word Hamin, but those ought only to be named so which are altogether, white, and are found in Winter time. But here in England it is called a Weafell, and forme do write it Weffl, or Weafell : But the white Weafel is called Minever, by the graniposition of the letters of the French word, it is called Herminne, and among the Illerians, Kolczauna.

derminne, and among the Illyrians, Kolezaupa.
Some do think at this day, that the beaft whole shape and form we have given for a Weasel, is the Shrew-moule, but not rightly, for their only reason is, that the bitings of it doth poylon and harm almost in like manner. Albertm alfo doth write, that the Sea Wealel is called the field Shrew, which is utterly falle and untrue; For the Shrew is called among the Grecions; Mygale, male or female. They do now allo commonly call Johnsuman the Indian Moule, and other ome the fallow Deer: But Damilla, or Donila, is of the Italians and some later barbarous Writers, altogether called acommon Weafel, and not Ichneumon, which is a peculiar beaft to the Egyptiant.

Now the Yeafon of the Latine name Muflela, Carolus Figulus is of opinion, that it is derived of Mys Niphus. and Stelle, two Greek words, because it devoureth Mice, and both the Germann and the English de- The etymolorivetheir word Steal, or Steller, to rob or flich, from the Greek word Steller, fo that it is so called, gy of Wealele, because this Wealer is a still, and secret, stealing, and devouring beath. Calegin saith, that Mustela is quefilungier Mus: This bealt is also called by Ariforle, Habeninum, and it is faid, that it bunteth Moles

The Brithers hereof are, fearfull, in-creeper, and swift, and beside these I finde not any mate. The epithets, rill, or worthy to be rehearsed. Now concerning their outward proportion, it is as we have colour, and seemed the colour the colour, and seemed the colour the colour the colour than the colour the colour than the colour t here described, a long and thin body, but the colour thereof warteth , for some of them are brown, veral parts. and branded, some black, and some clean white, which we have shewed already to be the Ermyn: for in some places of Germany, Helvetia, and the dier, the Weafels in the Winter become all white. But for almuch as there are two kindes of Wealels, one vulgar and domesticall, living in houses and Cities, and the other wilde, living in the Woods and Mountains it we finder also that they differ in colour, neither of both being constant in the same; for the domesticall Westel is upon the back, and fide fandy, red, and fometime yellowish, and alwayes, white, on the thebas; yea, fometimes as Geor. Agricola writeth, they are all white, whereat no man ought to wonder feeing the Hares of Helwill do in the Winter time turn white : And of thele white Weslels or Empry there are abundance in the Northern parts of Europe, where their Summers are fhort, and their Winters long & And thefe white Weafels differ nothing from the common vulgar Weafels of other colours, except that their hair flick fafter to tileir backs; and icis observed, that in Russa the Noblethwomen are apparelled with thefe skins ? And there is a Wood in Scandinavia (called Lanzetucca) which is fourfcore mile long, wherein are abundance of white Weafels : And the Kings tents, among the Tartariant are faid to be covered all over with the skins of Lyons without, and the walks o be hoog with these faming or white Weafels within, and although the price of thefe skins be very deer among them (for fometimes fo many as are lifed in one Common will east, swo thousand Crowns) yet do the prople earnestly feek after them, accounting it no small honour, to wear to much wealth upon the banks.

Now the reason why these beats came to be called Armilial, is from Armilla a chain, because they didwent them in fringes about their garments like chains, and although that fome of the Alpine. Mice be all white, and likewife the Pontique Moule, yet there, must be a difference observed betwine these Weslels which are properly called Armyri, and those Mice which are properly called Armyri, and those Mice which are no called only by way of resemblance, as we have newed already in their forces. And of the Pontique Moule, I may adde thus much more, that they live in the Winter time in hollow trees, whether they become as white as snow all one and of Min white as fnow all over, except their tails, and are in quantity, like squirrels; but in the end of Mey they then formewhat ted, because that then they give themselves to copulation and generation of young ones, when they lay alide their whiteheare, and live many, dayes, to gether in carnali copul-

Silvaticus.

The History of Four footed Beasts.

lation, among the green and fresh herbs; leaving behinde them such rank and unsavoury smells. lation, among the green and trem . And it is faid, that every three year their skins through abunas are very outous to a good term of the exceeding commodity of Merchants, and Skinners in Norway, and Helfyngia.

Of the Lem-

There are certain little four-footed beafts called Lemmar, or Lemmus, which in tempessuous and rainy weather, do feem to fall down from the clouds, and it was never yet found, whether their beginning arole first from heaven or earth, but this is certain that as foon as ever they have fallen beginning arose next from neaves of earth, but and in their bowels have been found green herb, to the ground, fome of them have been opened, and in their bowels have been found green herb, and therefore I marvel why ever it should be believed that these beath are bred of some seculent and therefore I marver why ever it amount ask me from whence then have they their beginning, I answer matter in the clouds; but if any man ask me from whence then have they their beginning, I answer from the earth, even as Locusts and Catterpillers, who are said in holy Scripture to be carried to and fro with the windes, and so these beasts being destitute of naturall food in their places of general states of the catterpillers. and tro with the winder, and fo are carried into other france and neration, do advance themselves into the winde, and so are carried into other france and me neration, and advance they fall like Locusts upon every green thing, living untill they haved. known Countrys, where they tafte of new grown herbs, they perifh and die, by means, whereof vource and or peftilence and corruption, but the Armins or Armins do eat and devour

Now the Skins of these beatts are exceeding delicate having in them divers colours, and therefore the people fleathem off from their bodies, and fell them by thirty or forty in bundles, for gran price; but of these skins I have said enough, both here and elsewhere. The wilde Wealels differ not from the vulgar domesticall Weafel, their foreteeth are short and not long like a Moule, the facebroad, their genital part like a Foxes, their tail short, their legs and clawes short, strong and tharp; and it is reported by Strabo, that the Weafels of Mauritania are as big as Cats, but their meping and opening of their mouth much longer, and wider. There is an Island called Discourse, on the one fide whereof (as Pliny writeth) there are Wealels, and through the middle there is way over which they never paffe, and on the other fide there are not only not any, bred, but allo if they be brought into it, they die and perifh, and fo likewife it is reported of Bestia,

abode.

They make themselves caves and holes in the earth, rocks, and walls, wherein they lodge into the which they frame two passages or doors, one into the South, the other into the Nonh, (refembling herein, the Squirrels) that so they may be free from the winde, on which side soeris bloweth, sometimes they get into stacks of Hay and straw, and there they lodge, those Wessels which live neer houses sleep not much, for they have been seen abroad all the Winter time, not only the vulgar but the Armins: neither are they unthankfull unto the Countrey means whole houses they lodge, for they kill, ear, and devour all manner of Mice, Rate, and Moles, for because of their long, flender bodies, they are apt to creep into the holes of the earth, and narrow pallages, fetching their prey from those places whither Cats cannot come; therefore in Historia the Countrey men nourish them more then Cats, because they destroy more vermin then Cats. The harm they do is to Hens, Chickens, and Bgs, and yet some fay they eat the Egs and let the Has alone: they are likewise enemies to Geele, and devour their Egs; and Elianus writers, that they come unto dead men, they will pull out their eyes in fuch manner as they do Egs, and therefore such Carkases are to be watched against them. Amontas writeth, that the Shrew mouses conceived betwire a Mouse and a Weasel, which opinion is not only ridiculous, but impossible for how is it likely that a Moule will ingender with that beaft which lyeth in wait to deftroy ber! Itin alfo faid, that a Weafel fighteth with those Serpents that hunt after Mice, for no other cause, but to gain the prey from him.

ception.

There is nothing in this bealt more strange, then their conception and generation, for they do not engender nor couple in their hinder parts, like other four-spoted beasts, but at their mouth, and for this cause Aristin written, the Jenn were bring forth their young ones at their mouth, and for this cause Aristin written, the Jenn were forbidden to eat them, for this their action was an emblem of folly, and of foolith man, which can keep no fecrets, but utter all that they hear (thus faith he) But we that are Christians bow other reasons why the Jewes were forbid to eat them. The Egyptians make of it another fign for they say, that their copulation at the ear, and generation at the mouth, are embleme of spech which is first taught to the ear, and then uttered by the tongue; there he other again, that hold this to be a fable: And Pope Clement writeth, that they conceive at the mouth, and bring forth as the ear. Many fay, it is true of the Weafel of the Sea, but not of the Weafel of the estib, which is therefore called Gollbara, and this they would confirm by another table of Medica, whole bead after it was cut off, it is faid to bring forth Coryfor and Pigajin; forme do alledge for this, epidion, that the Coryfor and the this do conscious the thing to the coryfor and the this do conscious the coryfor and the thing to the coryform and t that the Crowes and the Ibu do conceive at their mouths : but this is certain, that they have plant of conception underneath their tails like other four-footed healts, and therefore how is should come to passe, that their young ones should come forth at their mouths, I cannot askiy leads. It may be that the opinion thereof first arose from the fight of some old one carrying her young her mouth, for the young ones are very small like Mice, and therefore it is likely that they re move them to and fro, as Cats do their young ones, forthey are in continual fear, left shay should be taken and destroyed by men, or by some other enemy beast.

The dung of Weafels doth fmell many times like musk, the reason wheneof, we have thewed you in another place, all of them in generall have a most rank and filthy, sayour. It is a ravening and destroying beast; and although the body of it be very small, yet is the wit and understanding of it

very great, for with fingular art and subtilty it compasseth his prey, whereupon there lyeth this history of Galanthis the maid of Alemena, as Perottus observeth ont of Ovid. When Alemena was in long travel and childe-birth, it is faid that the maid perceiving the was hindered by Lucina, craftily obtained not only the knowledge of the cause by Lucina, but also the remedy; whereupon she eafed her Lady, (like a true and faithfull fervant) of many pains. Lucina feeing that the was beguiled by Galantbia, and that her crafty wit had over-reached a Goddeffe, the turned her into a wesfell, for her punishment, that as she had sinned by revealing of the counsell of the Goddess, the should be punished to bring forthall her young ones at her mouth, as Weafels do; and for this occasion, the Domesticall Weafel like a Maid doth continually live in houses, and her colour vellowish like the hair of Galambia: thus say they of metamorphosing and transforming

Other some say, that when Alemena was in travail of Hercules, having indured long torments, the was delivered by the fight of a Weafel which came in her prefence, and therefore the Theban Greians do religiously worship a Weasel, for they say, that as it was nourisht by Hecate the Goddesse, so it did nourish Hercules; but herein they take Gale for Galanthis aforesaid, that is, a Weafel, for Alemenaes maid; And feeing we have begun to talk of transformations, I will adde another thing out of Stobens, not impertinent to this common place, for he writeth in the difpraise of women, that the diversity of their dispositions perswadeth him that some of them are derived from one beaft, and some from another: and namely those which come of Weasels, are amilerable, fullen, and forrowfull kinde of women, to whom nothing is pleafing, delightfull, oracceptable, but having no minde to the pleasure of Venus, loathing her husband, hurteth her neighbours, robbeth her felf, and devoureth consecrated and hallowed things, even after the manner of Weasels, which will take a booty from the Altar: Thus faith he, which I beleive to be true inthe comparison, but not in the generation or transmutation of women from Wealels.

I do marvail how it came to passe, that a Weasel was called, an unhappy, unfortunate, and un. The signification beast among Hunters, for they held opinion here in England, that if they meet with a Weation of a Weating the significant was a significant to the s fel in the morning, they shall not speed well that day; therefore the Grecians say Galefteir, and Al-sels occurrence. ciatus hath an excellent Emblem, whereby he infinuaceth that it is not good to have a Weafel run upon ones lest hand, and therefore adviseth a man to give over his enterprize after such an Omen. Now although I would have no wife man to stand in fear of fuch a superstitious conceit, yet I will subscribe his verses, more for variety and elegancy, then for truth :

> Auspiciu res capta malis bene cedere nescit : Fælici que funt omine fatta, juvant. Quicquid ages, Mustela tibi si occurret, omitte: Signa male bec fortis bestia prava gerit.

It should feem that the beginning of this opinion did come from the punishment of a certain Generall of the Corinthians Navy, who being perjured in breaking his faith to that State, came running away from them; and they fay, that afterwards he could never fleep, but that he dreamed Weafels came and tore his flesh from his body : At last through anguish and grief of minde, hestew himself. These things are reported by Heraclides, which whether they be true or falle, are but a filly and slender foundation to build upon them a Propheticall opinion, or presage suture evils, and to I will leave the morall part of the Weafel, and return again to the naturall. They have knowledge like Mice and Rats, to run out of houses before their downfall. They live in hatred with the Serpent that hunteth Mice, for by eating of Rue they drive them out of houses wherein they inhabit, and this is a wonderfull work of God, that this filly beaft should have the knowledge of the vertue of that herb, and not only arm her felf with it, because it is hatefull to Serpents, and they in no wife in nature able to abide it, but also by it to restore to life again her young

There is a poyfon in Weasels which destroyeth the Cockatrice, for when the Weasel findeth the Cockatrices hole or den, the layeth her poylon in the mouth thereof, whereby two contrary natures meet and fight, and the lesser overcometh the greater; and this is affirmed both by Pliny and Solinus; wherefore all manner of Cattle do fear Weasels. They hunt all manner of birds, puling out their throat as a Wolf doth a Sheeps. They will play with Hares till they have wearyed them, and then destroy them; they are in perpetuall enmity with Swine, Ravens, Crowes, and Cats, for although Cats sometimes set upon them, yet they cannot overcome them. In many plathe of haly they are nourished tame, for as Ferrets are used to fetch Conies out of the earth, so are Weafels by tying a ftring about their neck, to fetch young Pigeons out of Dove-cotes, and birds out of their nells. If the powder of a Weasel be given unto a Cock, Chickens, or Pigeons, it is said, they shall never be annoyed by Weasels.

Likewife if the brain of a Weafel be mingled with a rennet in Cheefes, it keepeth them from being touched with mice or corrupted with age. The flesh of a Weasel is not used for meat, but dried and preserved for medicines. The powder thereof mixed with water, driveth away Mice, by cating the gall of Stellius in a house where Weasels are gathered together, and then by Oyl of bitter Almonds, or falt Ammoniak they are killed, but if one of their tails be cut off, all the residue do forfake the house. And thus much shall suffice concerning the History of Weasels, now followeth the medicines arising out of their bodies.

Ccc

The Medicines arifing from the Weafel.

V. linus.

Ætius.

A Weafel being applyed unto those which are troubled with Agues or Quartern Peavers, doin A Weater being approved unto the state of th in thort time cure them. It down ich are troubled with the gout, or any other infirmity in the joynt, mollifying medicine for those which are troubled with the gout, or any other infirmity in the joynt, molitying medicine for those which have a continual ache in the head, leaving a certain matter on the top and eafeth those which have a continual ache in the head, leaving a certain matter on the top thereof, and stroaking it from the forehead to the hinder part of the head

Pereot, and stroaking it from the sout, this is an excellent remedy. To take a little young whelp alive well fatted, and a living VVeafel in nine pints of Oyl, and unto the fame two or three pounds of well tatted, and a niving v value, in until the beafts be made lank or lither, and then to put your Butter, and to boyl them together, until the beafts be made lank or lither, and then to put your Butter, and to position to Better, will frained. Avicenna attributeth certain things to VVeahands or reet a whole day in health Authors rather ascribe to the powder of VVealels which are self-shell only, which the classical Authors rather ascribe to the powder of VVealels which are tels nein only, which the court, being drunk in wine against the Palling ficknesse, and the head ache, but it is accounted an especiali remedy against the bitings of Scorpions.

Avicenna.

I beophrastus.

Diofcorides.

ne, but it is accounted all expectations are good and effectually prefervative against all poylons.

The field of a VVealel being taken is a very good and effectually prefervative against all poylons. The same being taken in meat, the head and feet only cast away, doth help those which are troubled with wens or bunches in the flesh, being first anoyated with the blood of the same beast: The bloud of a VVeasel is very well applyed to broken or exulcerated fores in the flesh. The same vertue or a v veater is very with a Weafel, boyled in wine, being in the manner of a plaister placed therein. to. For the expelling of the gout take a dead Weafel, and boyl him in Oyl, untill it bemade it quid, (then strain forth the Oyl, and mingle it with wax, fashioning the same in the form of a plaister, and this being in good order applyed, will in very short time expell it quite away.

A house Weasel is wont to be burned for divers remedies, and to be embowelled with salt, and dryed in a shade. But there are some late writers which affirm, that a Weasel is better being dryed or burned for the faid difeafe, then used in the aforesaid manner, some also which are more solish

or purned for the fails shear, then shears the alore and the shear shear think it best, being only salted, but it is more proper, being used in the first manner.

The bodies of creatures which are dry by nature being dryed by the sprinkling of salt upon them, are unmeet for food, for a certain man going about to falt a Hare, made it like unto adred them, are unmeet for food, for a certain man going about to falt a Hare, made it like unto adred them. Some have written that the flesh of a Hedge-hog dried, doth very much profit the which are troubled with an outward or inward leprofie: which if it can effect, it will more from. ly have a drying force or power : even as the flesh of a VVeasel being dryed, and drunk in wine, cr. pelleth poylon. A vulgar VVeasel being kept very old, and drunk in wine, to the quantity of two drams, is accounted a present remedy against the venom or stings of Serpents.

A young VVeafel being prepared, as is before faid, that is to fay embowelled with falt, is of good force against all ill medicines. A VVeafel used in the same manner doth presently cure the bite of Serpents. A VVealet being burnt and dryed, especially the belly thereof, is accounted an excellent remedy against the bitings of any other wilde beast. Some small part of the belly of a young VVesfel, to the quantity of two drams being stuffed with Coriander, and drunk in wine, is given to those that are smitten by Scrpents, and is curable for them. The slesh of a VV casel being burnt, mingled with Rue and wine, and fo drunk, is very medicinable for the curing of the bites of all creatures. The young whelps of VVesfels being imbowelled with falt, is very profitable for the healing of the deadly stinging or biting of the Spider called Phalangium.

Pliny.

Galen.

Albertus.

The whelp of a Weafel doth cure the venemous bitings of the Shrew. The flesh of a Weafel being dryed, doth strongly drie and separate, by both which forces those are healed which are troubled with the Falling fickneffe having drunk it in wine. This vertue is also attributed unto the bloud of Weasels. A Weasel being dryed and drunk in wine, doth heal those that are troubled with the Palife or shaking of the joynts. Concerning the powder of Wealels, there are many things read : But Galen writeth, that he never burned this creature, that he might try the excellency thereof. The bloud and powder of a Weafel are very profitable, being anounted on those whose bodies are vext with the leprosie, according to the faying of Serenus in these verses;

Serenus.

Morbo adversme erit cedri de cortice succue, Mustelave cinia vel fusus sanguis ab illa.

The powder of a Weafel being mingled with the bloud of a young Swallow doth heal the Qualit or Squinzie, the inflamation of the jawes, as also those which are grieved with the strangury, being either taken in bread or in drink. The same is also very effectuall for the expelling of wens or bunches in the body, and healeth those which are troubled with the Falling licknesse, being dayly to ken in drink. The same diseases are both healed by this medicine, to burn a living Weasel alogother in an earthen pot, and to mingle with the powder thereof Hony, Turpentine, and Butter, of each a sufficient quantity, and in the manner of an Oyntment, to apply it unto the bodies of the grieved parties. The bloud of a Swallow and a Weafel are commended by some to be very gruent and agreeable, but Pliny, Avicenna, and the rest of the antient writers commend the blood of a Weafel only to be very medicinable for these diseases following; namely, the Falling sickness, the Foul evil, and the head-ache.

The powder of a Weafel being mingled in water, and given to one that is mad or frenzy to drink, Pliny. is reported by some to be very good and profitable for him, if so be that they can compell the frantick person to perceive it. The powder of a Weasel is very effectuall for the expelling or taking away of the pin and web in the eyes. There is a speedy remedy for the driving away of rheum in the away of the Catarrh swelling by rheum in the jawes, which is this, To take a Weafel upon a Thursday in the old Moon, and put him alive in an unburned pot, that in the Boyling he may be torn. day in the boying he may be torn, and dryed into powder, which powder being gathered together and well tempered with Hony, to

Of the Weasel.

will in thort space wonderfully ease him. A Weafel being burnt, and the powder thereof wrapped in some sear-cloth which is anounted over with the Oyl of Flower-deluces, doth help and heal all fores or impostumes proceeding from the head to the ears, being applyed thereunto. A VVeafel being beaten to powder, mingled with Galen. wax, and in the manner of a fear-cloth applyed unto the shoulders, doth expell all pains, aches, or eriefs therein what foever; it doth also purge or cleanse fores very effectually, according to the

give it to the diseased person every day in a spoon fasting, to the quantity of three drams, and it

Verses of Serenue following :

Obscanos si pone locos nova vulnera carpant, Horrentum man (a curantur fronde vuborum. Et si jam veteri succedit fistula morbo: Mustela cinere immisso purgabitur ulcue Sanguine cum ricini, quem bos gestaverit ante.

A VVcasel being burned in an earthen por, is very medicinable for the curing of the gour. The powder thereof being mingled with Vinegar, and in that manner thereunto applyed. The Dioferides. duft of a living VVeasel burnt, mingled with wax Rose-water, and anounted with a Feather upon gouty legs, cureth the same disease. The brain of a VVeasel being kept very long, and throughly dried afterwards mingled with Vinegar, and fo drunk, doth very effectually cure the falling lick-

The brains of a Camel mingled with the brains of a VVeasel, being both well dryed, and drunk Rasis. in Vinegar, speedily helpeth those which are troubled with the disease called the Foul evill. If a horse hall fall into a suddain disease (being for the most part termed dangerous) which our Countreymencall Reech, concerning which I have spoken in the Horse, he is cured by some Horse-coursers by asmall quantity of a VVeasels skin, being about the bignesse of a foresaid golden Crown) which is given to him inwardly, whether in a potion by some horn, or cut small and mingled with chasse. Iknow not. Some do give to the Horses troubled with the aforesaid disease the tail of a white Weafel being half black, and half white, cut exceeding small in their chaste or provender. If a Serpent or any other venemous creature shall sting or bite an Oxe, let the wounded place be stroked or smoothed with the skin of a VV casel, and it shall in short time be persectly cured. The famethey do in a manner command to be done to Horses which are so stung or bitten, rubbing the wound with a Weafels skin untill it wax hot, ministring in the mean time some certain Antidote within the Horses body. There are some also which are of opinion that the skin being in the said manner applyed, is of no efficacy, but that the whole beast being cut and applyed while it is hot, will rather profit, which both in a Shrew, as also in many other creatures is manifest.

The bloud of a Weafel being an oynted upon any impostume arising behinde the ear, doth in- Archigenes. stantly cause the swelling to cease, or being broken, doth speedily heal the fore. The same also being anounted upon any impostumes in the head either whole or broken, doth very effectually cure them. The bloud of a Weasel being anounted upon wens or bunches of flesh in any part of the body doth instantly expell them. The same doth also help those which are troubled with the Falling sicknesse: which disease is also cured by the whole body of a VVeasel either burnt or Isidorus. embowelled with falt. The head and feet of a VVeafel being cast away, and the body taken in any kinde of drink, doth perfectly heal those which are troubled with that pestiferous disease called 5. John evil. The bloud of the same same beast is an excellent remedy for the expelling of the foul evil. The bloud of a Weafel being anounted upon broken or exulcerated bunches in the flesh, doth not only mitigate the pain, but also heal the wounds. The bloud of a Weasel being anounted upon the jawes, doth heal all pains or fores therein what soever. The powder and bloud of a Weasel being both mingled together, and anounted upon the body of any leprous man, doth in short time drive away all scabs or scurfs thereon. The bloud of a VVeasel being anointed with a Plantain upon the kgor feet of any one that is troubled with the gout, doth very speedily mitigate or asswage the painthereof. The same being anounted upon the nervs or sinewes which are shrunk together, Galen. dotheafily mollifie them again, and loofen the grievous pain either in the joynts or articles. The liver of a VVeafel mingled with his own brains, being both well dryed, and taken in any kinde of drink, doth very much profit those which are troubled with the disease called S. John evil. The liver of a VVealel, being throughly dryed, and afterwards taken in water to drink, doth heal the diffuse called the Foul evil, taking hold of sense and minde together: but there must great are be had that this medicine be ministred unto the sick party, even when the disease is coming

on him. The gall of a Hare being mingled with the liver of a VVeafel to the quantity of three drams, one dram of Oyl of Beavers stones, four drams of Myrrhe, with one dram of Vinegar,

Myret fue.

Pliny.

and drunk in hony, or baftard wine, doth heal those which are troubled with a dizzinesse or certain and arunk in mony, or pattern wine, dott heart is reported to be very good and medicinable for the fwimming in the nead. Includer of a vyearer is reported to be red and including of the Lethargy, or Dropfic evil. The liver of a Weafel being bound to the left foot of a woman, doth altogether hinder her from conception. The gall of a Weafel is a very excellent and woman, doth altogether hinder her from conception. woman, does a segment and the venom or poylon of Afps, being taken in any kinde of drink. The enectuan remety against the ventors of poyton beaten to powder, and taken in wine, or any other yard of a Weafel, Hart, or Doe, being dried, and beaten to powder, and taken in wine, or any other yard of a Weatel, Hart, or Loe, being urieu, and bester to provide the first of Serpents. The yard of a Weaterink, is an excellent medicine for the curing of the bites or stings of Serpents. The yard of a Weaterink, is an excellent medicine for the curing of the bites or stings of Serpents. The yard of a Weaterink is commended for a very excellent remedy against the strangury, or disease talled the tel or retret, is commended lor a very excellent remedy against a fact of a female Weafel, is report.

Colick and stone. The stones of a male Weafel, or the secret parts of a female Weafel, is report. ed by some to be very medicinable for the curing of the Falling sicknesse. The stones of a Wassel being bound unto any part of a woman while she is in travail of childe birth, doth altogether himbeing bound unto any part of a woman while are a Weafel being bound in a piece of a Mule hide day her from her delivery. By the left stone of a Weafel being bound in a piece of a Mule hide. there is a certain medicine made, which being drunk by any woman not being with childe, caucht before is a certain medicine made, which being drunk by any woman not being with childe, bard and grievous pain in delivery. The efficacy or force in them, have the stones of a Weasel being cut off in the change of the Moon, and he for or force in them, have the Rolles of a vyealer being the woman in the hide of a Mule. The heel of a fered to go away alive, being tied upon any part of a woman in the hide of a Mule. The heel of a

Kiranides.

rered to go away anve, being tied upon any part of a woman, doth make her that the shall not contiving vyeater peing taken away and bound the value of a Dogs head dried, being put into anybroken ceive so long as she shall so bear it. The powder of a Dogs head dried, being put into anybroken or exulcerated fores, doth eat away all the corruption or dead flesh encreasing therein. The same vertue hath the powder of Weafels dung, being used in the said manner. The dung of Mice or of a Weasel, being anounted upon the head, is an excellent remedy for the

Æginetta.

falling off of the hair on the head, or any other part of mans body, and doth also curethe disease, called by some the Foxes evil. The biting of a Weasel is reported by some to be very venemous, and in his ravening or madnesse not to be lesse hurtfull then the bitings of mad Dogs. For Weasel is reported by some to be very venemous, and in his ravening or madnesse not to be lesse hurtfull then the bitings of mad Dogs. For Weasel is reported by some to be very venemous, and in his ravening or madnesse not to be lesse hurtfull then the bitings of mad Dogs. For Weasel is reported by some the property of the bitings of mad Dogs. fels and Foxes are very often mad. But Aradam is of a contrary opinion, and affirmeth that the Weafel doth more hurt by his biting, then by any venom he can put forth. Others allodosfirm, that there is venom in Weafels for this cause, that in all kinde of Weafels when they are angry the force of their smell is for ank and strong. The best way to drive away Mice, is by scattering the powder of Weasels or Cats dung up and down, the savour whereof Mice cannot abide, but the same being made into some certain kinde of bread will smell more frongly. That the bites of a Weiklare venemous and deadly, there is an example written by Aristides, of a certain man, who being bitten by a Weasel, and ready to die, gave a great figh, and said, that if he had died by a Lyon or Panther, it would never have grieved him, but to die by the biting of fuch an ignoble bealt, it grieved him worle then his death. The biting of a Weafel doth bring very quick and grievous pain, which is only known by the colour, being dusky or blewish: and it is cured by Onions and Garlick, either applyed outward, or taken in drink, so that the party drink sweet wine thereon. Unipe Figs also mingled with the flour of the grain called Orobos, doth much profit the same. Treacle in like manner being applyed in the manner of a plaister, speedily cureth them. Garlick being mingled with Fig-tree leaves and Cinamon, and so beaten together, are very well applyed to the hid bits. It cometh also to passe, that sometimes the Weasel biteth some Cattell, which presently kilkth them, except there be some instant remedy. The remedy for it is this, to rub the wounded place with a piece of a Weasels skin well dryed untill it waxe hot, and in the mean time give the best Treacle to drink in the manner of an antidote. The Weafel usually biteth Cowes dugs, which when they are swollen if they be rubbed with a Weafels skin they are instantly healed.

The leverall Æsculopim.

Wolf is called in Hebrew Zeeb, as it is faid in Gen. 49. and among the Chaldeans, Debt and Debt, among the Arabians Dib. The female is called Zebab a she-Wolf, and the masculine Zeeb, but in Read as it is called Zebab as the Wolf, and R. Hom Vica combuting Reads as it is called Zebab as the Country of the bim, but in Ezek, 22. it is called Zebeib, that is to fay, a Wolf. Alfebba (faith And. Bellun.) is a common name for all Four-footed beafts which do fet on men, killing and tearing them in piet, devouring them with their teeth and clawes, as a Lyon, a Wolf, a Tiger, and tuch like, whereon they are faid to have the behaviour of Alfebba, that is, wilde beafts which are fierce and cruel. from hence happily cometh it, that not only Albertus, but also some ignorant Writers do attribute unto a Wolf many things which Ariffotle hath uttered concerning a Lyon.

Of the Wolf.

Oppianus among the other kinde of Wolves hath demonstrated one which is bred in Cilicia. And also he doth write, that it is called in the mountains of Taurus and Amanus, Chryseon, that is to say, Aureum, but I conjecture that in those places it was called after the language of the Hebrewes or Syrium which do call Sahab, or Schab aurum, and Seeb Lupum for a Wolf, or Dahab, or Debah for Aurum: They also do call Deck or Decka for a Wolf. Dib (othertherwise Dijb) is an Arabian or Sarecenican word : Also the translation of this word in the book of medicines is divers; as Adib, Adep. Adbip, and Aldip: but I have preferred the last translation, which also Bellunenfis, doth use. Aldip Alambat doth fignifie a mad or furious Wolf. The Wolf which, Oppianus doth call Aureum, as I have faid even now, doth feem to agree to this kinde, both by fignification of the name Aurum. and also by the nature, because it doth go under a Dog close to the earth, to eschew the heat of the Summer, which Oppianus doth write, doth feek his food out of hollow places, as a Hyena or Dath doth out of graves where the dead men are buryed. The golden coloured Wolf is also more rough and hairy then the residue, even as the Hyena is said to be rough and maned. And also these Wolves necks in India are maned, but it differeth according to the nation and colour where there are any Wolves at all.

Lyon a Wolf among the Grecians, and Lugos, and Lucania, and Lycos, among some of the Arabi-can Writers, is borrowed from them, as Munster hath noted in his Lexicon of three languages. In Idly it is called Lupo. In Fren: b Loup, in Spain Lobo, in Germany Vulff, in England Wolf. In Illyria Vulk. as it were by a transposition of the letters of the Greek word. Now because both men, women, The notation Cities, places, Mountains, Villages, and many artificiall instruments have their names from the La- of Lupus and tine and Greek words of this beatt, it is not vain or idle to touch both them and the derivation Lycos. of them before we proceed to the naturall flory of this beaft. Lupus as fome fay in Latine is Quafi Leopos, Lyon-footed; because that it tesembleth a Lyon in his feet, and therefore Isidor w writeth, that nothing liveth that it preffeth or treadeth upon in wrath. Other derive it from Luker. the light, because in the twilight of the evening or morning it devoureth his prey, avoiding both extreme light, as the noon day, and also extreme darknesse as the night. The Grecians do also call Named apellathem Nyderinoi canes, dogs of the night. Lupa and lupula were the names of noble devouring Harlots, tives derived and from thenceforth cometh Lupanar for the stewes. It is doubtfull whether the nurse of Romulus from a Wolf. and Remus were a Harlot, or she-wolf, I rather think it was a Harlot then a Wolf that nursed thosechildren. For we read of the wife of Fostulus, which was called Laurentia, after she had playothewhore with certain Shepherds was called Lupa. In all Nations there are some mens names derived from Wolves, therefore we read of Lupus a Roman Poet, Lupus Servatus a Priest or Elder, of Lupus de Oliveto a Spanish Monk, of Fulvus Lupinus a Roman, and the Germans have Vulf, Vulfe, Hart, Vulfegang.

The Greetans have Lycambes, of whom it is reported he had a daughter called Neobole, which he promifed in marriage to Archilochus the Poet, yet afterwards he repented and would not perform bis promife, for which cause the Poet wrote against him many bitter Verses, and therefore Lycambes when he came to knowledge of them, dyed for grief. Lycaon was a common name among the Grecians for many men, as Lycaon Gnotius an excellent maker of edged tools. Lycaon the brother of Nessor another, the son of Priamus slain by Achilles: But the samous and notorious among all, was Lycaon, the King of Arcadia, the fon of Titan and the earth, whose Daughter Califto was deflowred by Jupiter, and by Juno turned into a Bear, whom afterwards Juno pitying, placed for a fign in heaven, and of whom Virgil made this Verse;

Pleiadas, Hyadas, claramque Lycaonia Arcioni.

There was another Lycaon the son of Pelasgus, which built the City Lycofui, in the Mountain Lyceus, this man called Jupiter Lyceus, upon a time facrificed an Infant upon his Altar, after which sacrifice he was presently turned into a Wolf. There was another Lycaon after him, who did likewise sacrifice another childe, and it was said, that he remained ten years a Wolf, and afterwards became a man again : whereof the reason was given, that during the time he remained a beast, he never tafted of mans flesh, but if he had tafted thereof he should have remained a bealt for ever. I might adde hereunto Lycopbron , Lycoflut, Lycimnius, Lycinus, Lycomedet, Lycurgus, Lycus, and of womens names, Lyca, Lyca, Lycafte, Lycoris, Ljoins, and many fuch others, besides the names of people, as Irpinia, of Mountains and places, as Lycabetus, Lyceus, Lyceina, Lycaonia, Lycifpus, Lycum Arifolles School. Of flouds and Rivers, as Lycu, Lycomus. Of Plants, as Wolfbane, Lepum salitarium, Lupinus, Lycantheum, Lycophris, Lycophone, Lycopsis, L)coscitation, and many such others, whereof I have only desired to give the Reader a taste following the same method that we have observed in other beasts : And thus much shall suffice to have spoken of the names of this beast,

The Countreyes breeding Wolves, are for the most part these that follow. The inhabitants of Guttwere wont to fay, that there was neither Wolves, Bears, nor Vipers could be bred in their Countreys Mind, because Jupiner was born there; yet there is in a City called Lycassus, (so named for the breeling multitude of Wolves that were abiding therein.) It is likewise affirmed of Sardinia, and Olympus, Wolves.

Ccc 3

kindes of

Oppianus.

Wolves.

a Mountain of Macedonia, that there come no Wolves in them. The Wolves of Egypt are leffer a Mountain of Maceaenta, that there could not the quantity of Poxes. The Wolves of Scanzia, by reason of entreespecially that part that normatical upon all their eyes: There are no Wolves bred in Lombardy mity of cold in those parts, are blinde and lose their eyes: There are no Wolves bred in Lombardy mity of cold in those parts, are onnue and to come into that Countrey, prefently they ring their beyond the Albes, and if any chance to come into that Countrey, prefently they ring their beyond the Alpes, and it any chains them, never giving over till they have killed him, or drove Bells, and arm themselves against them, never giving over till they have killed him, or drove Bells, and arm themielves against them, are three kinde of Wolves, and in Scandinavia the him out of the Countrey. In Norway there are three kinde of Wolves, and in Scandinavia the wolves fight with Elks. It is reported that there are Wolves in Italy, who when they look upon Wolves fight with Biss. It is that he cannot speak. The French men call those Wolves which

man, cause him to be ment Endbarnet. Among the Crotoniate in Meotie, and divers other parts have eaten of the flesh of ment Endbarnet. Among the Grotoniate in Meotie, and divers other parts have eaten or the nein of their entered there are fome few in France, but none at all in England, exof the world, vyolves an about the first the Tower of London, to be seen by the Prince and people, brought out cept such as are kept in the Tower of London, to be seen by the Prince and people, brought out cept fuch as are kept in the above fell out a rare accident, namely, a Maltive Dog was limed to of other Countreys, where there is not a fact account fix or feven young Whelps, which a she-Wolf, and she thereby conceived, and brought forth six or seven young Whelps, which

was in the year of our Lord 1605. or thereabouts.

as in the year of our Lord 1803. Of the the world, whereof Opplanus in his admonition to Shep.

There are divers kindes of Wolves in the world, whereof Opplanus in his admonition to Shep. There are givers kinues of violves in the work, which wolf, and runnerh fast, called therefore Texnerds, maketh mention of the, the fecond kinde are called Happager, and these are the enter, that is, Sagittarius, a shooter. The second kinde are called Happager, and these are the enter, triac is, sometiment, a modern Christ in the Gospel compareth false Prophets, when greatest raveners, to whom our Saviour Christ in the Gospel compareth false Prophets, when greatest raveners, to which out out which come unto you in Sheeps clothing, but are inwardh Lyco he faith, Take heed of falle Prophets which come unto you in Sheeps clothing, but are inwardh Lyco ne lattn, take need of faile respect, was the latter than the third kinde is called Laput aneut. Harpages, ravening Wolves; and these excell in this kinde. The third kinde is called Laput aneut a golden Wolf, by reason of his colour; then they make mention of two other kindes, (called Acmone) and one of them peculiarly lainus.

Comona, and one of them peculiarly available then other Wolves, and likewife greater legs fitted.

The first, which is swift, hath a greater head then other Wolves, and likewife greater legs fitted. to run, white spots on the belly, round members, his colour betwixt red and yellow, he is very bold, howleth fearfully, having fiery-flaming eyes, and continually wagging his head. The fecond kinde nowieth restrictly, naving hery-manning being swifter then all other; betimes in the morninghe hath a greater and larger body then this, being swifter then all other; betimes in the morninghe being very hungry, goeth abroad to hunt his prey, the fides and tail are of a filver colour, he inhabireth in the Mountains, except in the Winter time, wherein he descendeth to the gates of Citis or Towns, and boldly without fear killeth both Goats and Sheep, yet by stealth and secretly.

The third kinde inhabiteth the white Rocks of Taurus and Silicia, or the the tops of the hill dou. mu, and fuch other sharp and inaccessible places, being worthily for beauty preferred beforethe others, because of his golden resplendent hairs and therefore my Author saith, Non Lugar sed Lupopressamior fera. That he is not a Wolf, but some wilde beast excelling a Wolf. He is exceeding frong, especially being able with his mouth and teeth to bite asunder not only stones, but Brasse and Iron: He feareth the Dog star, and heat of Summer, rejoycing more in cold then inwarm weather, therefore in the Dog dayes he hideth himself in some pit or gaping of the earth, untilithat Sunny heat be abated. The fourth and fifth kindes are called by one common name Account, now Acmon signifieth an Eagle, or else an Instrument with a short neck, and it may be that these are so called in refemblance of the ravening Eagle, or else because their bodies are like to that infrument, for they have thort necks, broad thoulders, rough legs and feet, and finall fnowts, and little eyes: herein they differ one kinde from the other, because that one of them hath a back of a silver colour, and a white belly, and the lower part of the feet black, and this is Itimus canus, a gray Kite-wolf; the other is black, having aleffer body, his hair standing continually upright, and liveth by hunting of Hares. Now generally all Authors do make some two, some three, some four, and some five kinds of Wolves, all which is needlesse for me to prosecute, and therefore I will content my self with the only naming of such differences as are observed in them, and already expressed, except the Ther and the fea-Wolf, of whom there shall be something said particularly in the end of this Hillory. Olaus Magnus writeth, in his History of the Northern Regions, that in the Mountains called Duffm, which do divide the Kingdomes of Swella and Norway, there are great flocks or heards of Wolves of white colour, whereof some wander in the Mountains, and some in the vallies. They feed upon little, small, and weak creatures, but there are also wilde common Wolves, who lie in wait to destroy their herds of Cattell, and flocks of Sheep, against whom the people of the Country doordain generall huntings, taking more care to destroy the young ones then the old, that so the breeders and hope of continuance may be taken away. And some also do keep of the Whelpsalive, shutting of them up close and taming them, especially semales, who afterwards engender with Dogs, whose Whelps are the most excellent keepers of flocks, and the most enemies to Wolves of all other.

There be some have thought that Dogs and Wolves are one kinde; namely, that vulgar Dogs are tame Wolves, and ravening Wolves are wilde Dogs. But Sealiger hath learnedly confluted this opinion, shewing that they are two distinct kindes, not joyned together in nature, nor in any natural action, except by constraint; for he saith, that there are divers wild Dogs that are not Wolves, and to have continued for many years in a hill called Mountfalcon, altogether refusing the fociety and for vice of men, yea, fometimes killing and eating them; and they have neither the face, nor the voyte, nor the stature, nor the conditions of Wolves, for in their greatest extremity of hunger, they never set upon flocks of Sheep : so that it is unreasonable to affirm, that Wolves are wilde Dogs. although it must needs be confessed, that in outward proportion they are very like unto them. Some have thought that Wolfs cannot bark, but that is false (as Albertu writeth) upon his own The voices of knowledge, the voyce of Wolfs is called Villain, howling, according to these verses

Of the Wolf.

Ast Lupus ipse ululat, frendet agrestis aper, And again: Per nottem resonare Lupis ululantibus urbes.

It should feem that the word Ululaism, which the Germans translate Heulen; the French Hurler and we in English, howling, is derived either from imitation of the beafts voice; or from a night whooping Bird called Viula, I will not contend, but leave the Reader to either of both, for it may he that it cometh from the Greek word Ololu zein, which fignifieth to mourn and howl after a lamenwhile manner, and so indeed Wolfs do never howl, but when they are oppressed with famin; And thus I leave the discourse of their voyce with the Annotation of Servine : Ululare Canum est & Furiarum. To howl is the voyce of Dogs and Furies. Although there be great difference of colors in Wolfs. as already I have shewed, yet most commonly they are gray and hoary, that is, white mixed with other colours, and therefore the Greelans in imitation thereof, do call their twy-light which is betwixt day and night, as it were participating of black and white Lycophos, Wolf-light, because the upper side of the Wolfs hair is brown, and the neather part white. It is faid, that the shaggy hair of a Wolf is full of vermin and worms, and it may well be, for it hath been proved, that the skin of a Sheep which was killed by a Wolf breedeth worms.

The brains of a Wolf do decrease and increase with the Moon, and their eyes are yellow, black, and The several very bright, sending forth beams like fire, and carrying in them apparent tokens of wrath and malice : parce, and for this cause it is said, they see better in the night then in the day, being herein unlike unto men, that see better in the day then in the night, for reason giveth light to their eyes, and appetite to beaths, and therefore of ancient time the Wolf was dedicated to the Sun, for the quickness of his feeing sense, and because he seeth far. And such as is the quickness of his sense in seeing, such also it is Calius. in smelling, for it is reported, that in time of hunger by the benefit of the winde, he smelleth his Stumpfius. prey a mile and a half or two mile off: for their teeth they are called Charcharodontes, that is fawed. yet they are smooth, sharp, and unequal, and therefore bite deep, as we have shewed already, for this cause the sharpest bits of Horses are called Lupata.

All beafts that are devourers of flesh do open their mouths wide, that they may bite more firongly, and especially the Wolf. The neck of a Wolf standeth on a straight bone that cannot well bend, therefore like the Hyana, when he would look backwards he must turn round about, the fame neck is short, which argueth a treacherous nature. It is said that if the heart of a Wolf be kept dry,it rendreth a most fragrant or sweet smelling savour. The liver of a Wolf is like to a Horses hoof, and in the bladder there is called a certain stone call'd Syrites, being in colour like Saffron or Hony, yetinwardly contains certain weak thining stars: this is not the stone called Syriacus or Indicus, which is defired for the vertue of it against the stone in the bladder. The fore-feet have five distinct toes, and the hinder-feet but four, because the fore-feet serve in stead of hands, in Lions, Dogs, Wolfs, and Panthers. We have spoken already of their celerity in running, and therefore they are not compared to Lions which go foot by foot, but unto the swiftest Dogs. It is said they will swim, and go into the water two by two, every one hanging upon anothers tail, which they take in their mouths, and therefore they are compared to the days of the year, which do successively follow one another, being therefore called Lucabas. For by this successive swimming they are better strengthened against impression of the flouds, and not lost in the waters by any over-flowing waves or billows. Great is the voracity of this beaft, for they are so insatiable that they devour hair The meat and and bones with the flesh which they eat, for which cause they render it whole again in their excre- voracity of ments, and therefore they never grow fat. It was well faid of a learned man : Lupus vorat potius Wolfs. quam comedit carnes, & pauco utitur potu. That is, A Wolf is said rather to raven then to eat his meat. When they are hungry they rage much, and although they be nourished tame, yet can they not Alianus. abide any man to look upon them while they eat; when they are once satisfied, they endure hun-Philes. gera great time, for their bellies standeth out, their tongue swelleth, their mouth is stopped, for when they have drove away their hunger with abundance of meat, they are unto men and beafts as meek as Lambs, till they be hungry again, neither are they moved to rapine, though they go through a flock of sheep : but in short time after, their bellies and tongue are calling for more meat, and then faith mine Author: In antiquam figuram redit, iterumqne Lupus existit. That is, They return to their former conditions, and become as ravening as before. Neither ought this to feen strange unto any man, for the like things are formerly reported of the Lion; and it is faid that Wolfs are most dangerous to be met with all towards the evening, because of their falling all the day before, and for this is alleadged the faying of holy Scripture where the Prophet makes mention of Lupi Vespertini, but we have shewed already in the story of the Hyana, what

It is faid that Wolfs do also eat a kinde of earth called Argilla, which they do not for hunger, but to make their bellies waigh heavy, to the intent, that when they fet upon an Horse, an Ox, a Hart, an Elk, or fome fuch strong beast, they may weigh the heavier, and hang fast at their throats till they have pilled them down; for by vertue of that tenacious earth, their teeth are tharpened, and the weight of their bodies encreased; but when they have killed the beast that

Wolves are not wilde Dogs.

Of the Wolf.

Albertus.

they fee upon, before they touch any part of his flesh, by a kinde of natural vomit, they disorge themselves, and empty their bellies of the earth, as unprofitable food.

themselves, and empty their beines of the cast, and if there be many of them in The remainder of their meat they always cover in the earth; and if there be many of them in the remainder of their meat they always cover in the earth; and sometimes it is said, that they hunting together, they equally divide the prey among them all, and sometimes it is said, that they hunting together, they equally divide the prey among their prey be plentiful. Now this they have common with Lions, in their greatest extremity of hunger, that when they are man and a beast, they for sake the man and take the beast. Some are of opinion, that when they are man and a beast, they for sake the man and take the beast. Some are of opinion, that when they are old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come unto Cities and Villages; offering old, they grow weary of their lives, and that therefore they come are of opinion, that when they are lives and the lives of t

Maid was faved, and the Wolf was killed.

Now those Wolfs that are most fluggish and least given to hunting, are most ready to venture upon nen, because they love not to take much pains in getting their living. This Wolf is called Vimon men, because they love not to take much pains in getting their living. This Wolf is called Vimon nen, because they love not to take much pains in getting their living of their goods, accounting the taked of the session of these things I have a living man, except he have formerly tasted of the session of their goods, accounting them their encipic quarrels against every man that is rich for the spoil of their goods, accounting them their encipic quarrels against every man that is rich for the spoil of their goods, accounting them their mies, how well soever they have deserved at their hands: In like manner, Wolfs in the time of their mies, how well soever they have deserved at their hands: In like manner, which is not beautiful to the spoil of their pains and that come in the way, whether they be men or beasts, without partial hunger fall upon all creatures that come in the way, whether they be men or beasts, without partial hunger fall upon all creatures that come in the way, whether they be men or beasts, without partial hunger fall upon all creatures that come in the way, whether they be men or beasts, without partial hunger fall upon all creatures that come in the winter time, wherein they are not assault to come to lity, to fill their bellies, and that especially in the winter time, wherein they are not assault to come to lity, to fill their bellies, and that especially in the winter time, wherein they are not assault to come to lity, to fill their bellies, and that especially in the winter time, wherein they are not assault to come to lity, to fill their bellies.

Houses and Cities.

They devour Dogs when they get them alone, and Elks in the Kingdom of Norway, but for Dogs it hath been seen, that they have lived in a kinde of society and fellowship with Wolfs, but Dogs it hath been seen, that they have lived in a kinde of society and fellowship with Wolfs, but Dogs it hath been seen in the inght time, like as Theeves do cover their malice and screet it was to steal and devour in the night time, like as Theeves do cover their malice and screet grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men. Wolfs are enemies to grudges one to other, when they are going about to rob true men.

They also devour Goats and Swine of all forts, except Boars, who do not easily yeeld unto Wolfs. It is said that a Sow hath resisted a Wolf, and that when he fightest with her, he is forced to use his greatest crast and subtlety, leaping to and from her with his best activity, less the should lay her teeth upon him, and so at one time deceive him of his prey, and deprive him of his life. It is reported of one that faw a Wolf in a Wood, take in his mouth a piece of Timber of some thirty or forty pound weight, and with that he did practise to leap over the trunk of atree thas lay upon the earth; at length when he perceived his own ability and dexterity in leaping with that weight in his mouth, he did there make his cave and lodged behinde that tree; at last it fortuned there came a wilde Sow to feek for meat along by that tree, with divers of her Pigs following her, of different age, some a year old, some half a year, and some less. When he saw them near him, he suddenly let upon one of them, which he conjectured was about the weight of wood which he carryed in his mouth, and when he had taken him, whilest the old Sow came to deliver her Pig at his first crying, he suddenly leaped over the tree with the Pig in his mouth, and so was the poor Sow beguiled of her young one, for the could not leap after him, and yet might stand and see the Wolf to eat the Pig which he had taken from her. It is also said, that when they will deceive Goats, they come unto them with the green leaves and small boughs of Osiers in their mouths, wherewithal they know Goats are delighted, that so they may draw them therewith, as to a bait to devour them.

Their manner is when they fall upon a Goat or a Hog, or some such other Beast of small sture, not to kill them, but to lead them by the ear with all the speed they can drive them to their sellow Molfs, and if the beast be stubborn and will not run with him, then he beateth his hinder-part with his tail, in the mean time holding his ear fast in his mouth, whereby he causeth the poor Basto his tail, in the mean time holding his ear fast in his mouth, whereby he causeth the poor Basto run as fast or safter then himself unto the place of his own execution, where he sindeth a crew of ravening Wolfs to entertain him, who at his first appearance seize upon him, and like Devils tearhim in pieces in a moment, leaving nothing uneaten but only his bowels.

But if it be a Swine that is so gotten, then it is said, that they lead him to the waters, and there kill him, for if they eat him not out of cold water, their teeth doth burn with an untolerable heat. The Harts when they have lost their horns do lie in secret, feeding by night for sear of the Wolfs. The Harts when they have lost their horns do lie in secret, feeding by night for fear of the Wolfs we have untill their horns do grow again, which are their chiefest defence. The least kinde of Wolfs we have untill their horns do grow again, which are their chiefest defence. The least kinde of Wolfs we have showed already, do live upon the hunting of Hares, and generally all of them are enemies to sheep for the soolish sheep in the day time is easily beguiled by the Wolf, who at the sight of the Sheep for the foolish sheep into him, for maketh an extraordinary noise with his soot, whereby he calleth the foolish Sheep into him, for shading amazed at the noise he salleth into his mouth and is devoured: but when the Wolf in the shading amazed at the noise he falleth into his mouth and is devoured: but when the Wolf in the night time cometh unto a fold of Sheep, he first of all compasses but when the wolf in the sheepheard and the Dog, whether they be asses or awake, for if they be present and like the Shepheard and the Dog, whether they be asses or awake, for if they be present and like resist, then he departeth without doing any harm, but if they be absent or asses, the hard no opportunity, but entereth into the fold, and falleth a killing, never giving over till he have destroyed all, except he be hindered by the approach of one or other; for his manner is not to destroyed all, except he be hindered by the approach of one or other; tor his manner is not to the same that the over-livers will tell tales, but for the

his insatiable minde thinketh he can never be satisfied, and then when all are slain he falleth to ear one of them.

Now although there be great difference betwist him and a Bull both in strength and stature, yet is he not afraid to adventure combat, trusting in his policy more then his vigor, for when he setteth upon a Bull, he cometh not upon the front for fear of his horns, nor yet behinde him for fear of upon a Duli, the first of all standeth aloof from him, with his glaring eyes, daring and provoking the Elianus Bull, making often proffers, to come near unto him, yet is wife enough to keep aloof till he fpy his advantage, and then he leapeth suddenly upon the back of the Bull at the one side, and being so aftended, taketh such hold that he killeth the Beast before he loosen his teeth. It is also worth the observation, how he draweth unto him a Calf that wandereth from the dam, for by fingular treethe chery he taketh him by the nofe, first drawing him forward, and then the poor Beast striveth and chery ne taketh link by the state of the sta letteth go his hold, whereby the poor Beaft falleth back upon his buttocks, and fo down right upon his back; then flyeth the Wolf to his belly which is then his upper part, and eafily teareth out his bowels, fo fatisfying his hunger-greedy appetite: But if they chance to fee a Beast in the water. or in the marsh, encombred with mire, they come round about him, stopping up all the passages where he should come out, baying at him, and threatning him, so as the poor distressed Ox plungeth himself many times over head and ears, or at the least wife they fo vex him in the mire, that they never fuffer him to come out alive. At last when they perceive him to be dead and clean without lie by inflocation; it is notable to observe their fingular subtilty to draw him out of the mire, whereby they may eat him; for one of them goeth in, and taketh the Beaft by the tail, who drawth him with all the power he can, for wit without firength may better kill a live Beaft, then remove a dead one out of the mire: therefore he looketh behinde him and calleth for more help, then preently another of the Wolfs taketh that first Wolfs tail in his mouth, and a third Wolf the seconds, a fourth the thirds, a fifth the fourths, and fo forward, encreasing their strength, until they have pulled the Beaft out into the dry land : whereby you may fee, how they torment and fretch their own bodies, biting their tails mutually, piaching and fraining every joynt until they have compafied their defire, and that no man should think it strange for a Wolf to kill an Ox; it is reported that Danau did build a Temple to Apollo at Argos, in the very same place where he saw a Wolf defroy an Ox, because he received instruction thereby, that he should be King of Greece. Wolfs at also enemies to the Buffes, and this is no marvail, seeing that it is confidently reported by when they meet together, each one bemoaning himself to other, as it were by consent they run round in a circle, and that Wolf which is first giddy, being not able to stand, falleth down to the gound, and is devoured by the residue, for they tear him in pieces, before they can arise

Phy affirmeth that there be Wolfs in Italy, whose fight is hurtful to men, for when a man seeth The harm of one of them, though he have never so much desire to cry out, yet he hath no power: but the mean-Wolfs. not speak, but if the man see the Wolf, the Wolf sir signer and the man is silent, and cannot speak, but if the man see the Wolf, the Wolf is silent and cannot cry, otherwise the tale is should be should be seen the prover be the same of the tale is show although these things are reported by Plate, Ruelius, Vincontius, and Ambrose, yet I rather believe them to be sabulous then true, how beit Albertus writeth, that when a man is in such extremity, sexum sith, that in case one of these Wolfs do see a man first, if he have about him the tip of a Wolfs tail he shall not need to fear any harm. There be a number of such like tales concerning shall never conceive with young. All domestical four-sooted Beasts, which see the eye of a Wolf, the hand of a man, will presently fear and run away.

the hand of a man, will prefently fear and run away.

If the tail of a Wolf be hung in the cratch of Oxen, they can never eat their meat. If a Horse tread upon the foot-steps of a Wolf which is under a Horse-man or Rider, he breaketh in pieces, or else and the amazed. If a Wolf treadeth in the foot-steps of a Horse which draweth a Waggon, he clearlist in the rode, as if he were frozen.

If a Mare with Foal tread upon the foot-steps of a Wolf, she casteth her Foal, and therefore the Egiissis when they signific abortment, do picture a Mare treading upon a Wolfs foot. These and such other things are reported, (but I cannot tell how true) as supernatural accidents in Wolfs. The Wolf also laboureth to overcome the Leopard, and solloweth him from place to place, but forsimuch as they dare not adventure upon him single, or hand to hand, they gather multitudes, and soldwour them. When Wolfs set upon wilds Boars, although they be at variance among them-Orse. selves, yet they give over their mutual combats, and joyn together against the Wolf their common adversary. For these occasions a Wolf hath evermore been accounted a most serve and wilde Beast, as may surther appear by this History following. When Euristines and Proctes intended to marry A history, by affinity, they went to Delphos to ask counsel of Apollo in what place they should meet with their wives. Apollo gave them answer, that when they should meet with an extreme wilde Beast, as they went into Lacedemonia, and yet the same Beast appear meek and gentle unto them, there they

Textor.

The History of Four-footed Beasts.

should take their wives. When they came into the land of the Cleonians, they met with a Wolf mould take their wives. When they cancelved that the meaning of Apollo was, that when carrying a Lamb in his mouth, whereupon they conceived that the meaning of Apollo was, that when carrying 2 Lamb in his mouth, whereast, they might very happily and fuctoffively take them wives, they met with a Wolf in that Countrey, they might very happily and fuctoffively take them wives, they met with a vy oir in that Country, they may be the funder Cleonymu, a very honest man of and so they did, for they married with the daughters of The ander Cleonymu, a very honest man of and so they did, for they married with the daughter share values from man, however, and of the country that was a state of the and to they did, for they married with the unuguestated that valiant firong man, how upon a featon rend.

Men defineyed that Countrey. It is reported of Mile Crotoniata, that valiant firong man, how upon a featon rend. that Countrey. It is reported of the arms was taken in the cloting of the tree, and he had not ing a cree in funder in the woods, one of his arms was taken in the cloting of the tree, and he had not ing a tree in lunder in the woods, one of the attitue there inclosed in most horrible torments, until a strength enough to loose it again, but remained there inclosed in most horrible torments, until a

Wolf came and devoured him.

Cilius. Tzerzes.

by Wolls.

of came and devoured min.

The like flory unto this, is that which Elianw reporteth of Gelon the Syracufan, a Scholar, unto The like itery unto this, is that which advantage on his Tables, and took the writing tables whom there came a Wolf as he fat in the School writing on his Tables, and took the writing tables whom there came a violt as he lat in the school withing tables out of his hand The Schoolmaster being inraged herewith, and knowing himself to be a valiant man, took hold of the same tables in the Wolfs mouth, and the Wolf drew the Master and Scholars man, took now of the fame tables out of the School into a plain field, where fuddenly he defired in hope of recovery of the tables out of the School into a plain field, where fuddenly he defired to hope of recovery of the tables out of the School into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field, where fuddenly he defired to have the school into a plain field. the Schoolmaster and a hundred Scholars, sparing none but Gelon, whose tables were a bait for that prey, for he was not only not flain, but preserved by the Wolf, to the singular admiration of all the prey, for ne was not only not had, but plataccident did not happen naturally, but by the over-ne world; whereby it was collected, that that accident did not happen naturally, but by the over-ne world; whereby it was confected, that the wooll and skin of beafts killed ling hand of God: Now for these occasions, as also because that the wooll and skin of beafts killed ung nand of South 140w lot these occurrency, the flesh of Sheep is more sweeter) are unprofusile and by Wolves are good for nothing, (although the flesh of Sheep is more sweeter) are unprofusile and

hunters.

ood for nothing. Men have been forced to invent and finde out many devises for the destroying of Wolfs, for ne. Wolfs, and the cefficy hath taught men much learning, and it had been a shameful mifery to indure the tykanny of teward of the cefficy hath taught men much learning for refiseance and revenue. Conching the description of the cefficient and t fuch ipoiling beafts, without labouring for refiftance and revenge: for this cause they propounded luch ipoining beauts, without labouring for resistance and town, he that killed a young VVolf received alfo a reward to fuch as killed VVolfs, for by the law of Draco, he that killed a young VVolf received

a talent, and that killed an old Wolf received two talents. solon prescribed that he that brought a VVolfalive, should receive five pieces of money, and he that brought one dead, should receive two. Apollo himself was called Lycothom, a VVolfhe that brought one dead, mould receive two. that it is faid immediately after he was born of his mother Lalona, he was changed into the sapeof a VVolf, and so nourished; and for this cause there was the Image of a VVolf set up at Debis

Others say, that the reason of that Image was, because that when the Temple of Delphi was before him. robbed, and the treasure thereof hid in the ground, while diligent inquisition was made after the theeves, there came a VVolf and brought them to the place where the golden veffels were covered in the earth, which she pulled out with her feet. And some say that a VVolf did kill the saile. ger, as he lay afleep on the Mountain Parnassus, having all the treasure about him, and that every day the came down to the gates of Delphos howling, until some of the Citizens followed berinto the Mountain, where she shewed them the theef and the treasure both together: But list not to follow or fland upon these fables. The true cause why Apollo was called a VVolf-killer was, for that he was feigned to be a Shepheard or Herdiman, and therefore in love of his Cattle to whom VVolfs were enemies, he did not only kill them while he was alive, but also they were offeredunto him in facrifice, for VVolfs were facred to Apollo, Jupiter, and Mars: and therefore we read of Apollo Lycim, or Lycem, to whom there were many Temples builded, and of Jupiter Lycem, the factifices instituted unto him called Lycea, and games by the same name. There were other holy-days call'd Lupercalla, wherein barren women did chastise themselves naked, because they bare no children, hoping thereby to gain the fruitfulnels of the womb, whereof Ovid speaketh thus:

Excipe facunda patienter verbera dextra: Fam focer optatum nomen babebit aut. !

Properties and some other writers seem to be of the minde that those were first instituted by Fibius Lupercius, as appeareth by these verses:

> Verbera pellitus (eto samovebat arator, Unde licens Fabius sacra Luperom habet. And Junenal thus: Nec prodest agili palmas prabere Luperco.

ons to take Wolfs.

Divers policies Now concerning the manner of taking of VVolfs the Ancients have invented many deviles and gloss and first of all an Iron toil which they still fasten in the earth with Iron pins, upon which pins they feave a ring, being in compassabout the bigness of a VVols head, in the midst whereof they lay piece of flesh, and cover the Toil, so that nothing is seen but the flesh, when the Wolf cometh and taketh hold of the flesh, feeling it stick, pulling hard, he pulleth up the ring, which bringeth the whok Toil on his neck, and sharp pins. This is the first manner that Crescentiens repeateth of taking Wolfs, and he faith there are other devises to ensnare their feet, which the Reader cannot understand, except he saw them with his eyes.

The Italians call the nets wherein VVolfs are taken, Tagliola, Harpago, Lo Rampino, and Lycim, the French, Hauspied; and Blondus affirmeth, that the shepheards of Italy make a certain gin with a na,

wherein that part of the VVolf is taken which is first put into it. Now the manner of taking VVolts in ditches and pits is divers, first of all they dig a deep ditch, fo as the VVolt being taken, may in dictors and of it, upon this pit they lay a hurdle, and within upon the pillar they fet a live Goofe or Lamb, when the VVolf windeth his prey or booty, he cometh upon the trench, and feeing it at a little hole which is left open on purpose to talk the VVolf into the deep dirch; and some use to lay upon it a weak hurdle, fuch as will not bear up either a man or a beaff, that so when the VVolf comethupon it, it may break, and he fall down; but the best devise in my opinion that ever was invented in this kinde, is that the perch and hurdle may be formade, and the bait fo fet, that when one wolf is fallen down it may rife again of it owne accord, and fland as it did before to entrap another : and great care must be had, that these kinde of ditches may be made in solid and strong earth, or if the place afford not that opportunity, then must the inside be lined with boards, to the intent that the heaft by fcraping and digging with his feet make no evalion.

The Rheitans use to raise up to a Tree a certain engine like a Mouse-trap, but much greater, through which there is a cord where they hang a bait of flesh or pullen, or some such thing which the VVols loveth; when he cometh unto it, he fuddenly fnatcheth at it, and so pulleth the trap upon his own onte. The Tenerians, Mysians, and Thraseans, Inhabitants of Asia, were wont to carry short weaconsto kill VVolfs, and they used also the strongest Dogs, who by the incouragement of the Huntters would tear the VVolfs in pieces, for there is hardly any Dog fo couragious, as to adventure upon

AVVolf at fingle hand.

The Dogs have therefore certain collers made unto them of leather stuft full of sharp Iron mails, to the intent that their necks may be fafe guarded from the VVolfs biting. Now Blonus faith, that all hunting of VVolfs with Dogs is in vain, except there be also set up certain great nets made of frong cords, fretched out and standing as stiffe as may be immoveably fastned to the bodies of trees. or firong pillars in the earth, and in divers places of these nets they must set boughs to cover them. to the end the VVolf descry them not; and at either end of the net must be made a little shed with boughs to cover a man, wherein the hunter must lodge with his Spear, ready to pierce through the VVolf when he perceiveth him in the net, for if the VVolf be not instantly wounded, he will deliver himself and escape, and then also he must be followed with the cry of Men and Dogs, that he may not return back again into his den, and the Hunters observe this order in hunting of a VVolf, and driving him to their nets.

When they are far from their nets, they hunt them but gently, and let them go at leisure, but when they are closer and nearer unto them, they follow them with all speed and violence, for by that means many are intrapped and fuddenly killed; and these are those hunting observations which I finde to be recorded in Authors for the taking of VVolfs. And this is the nature of this bult, that he feareth no kinde of weapon except a stone, for if a stone be cast at him, he presently filleth down to avoid the stroke, for it is said that in that place of his body where he is wounded by a flone, there are bred certain worms which do kill and deftroy him; and therefore the Egyptians when they do decipher a man that feareth an eminent danger, they picture a VVolfand a stone; as

Wolfs do likewise fear fire even as Lions do, and therefore they which travel in woods and secet places by night, wherein there is any fuspicion of meeting of VVolfs, they carry with them a couple of flints, wherewithal they firike fire, in the approach of the ravening beaff, which fo dazleth his eyes, and danteth his courage, that he runneth away fearfully. It is faid that VVolfs are afraid of the noise of swords or iron struck together, and it may well be, for there is a true story of a mantravelling near Bafil, with a bell in his hand, who when he saw that the throwing stones at the VVolf which followed him would nothing avail, and by chance fell down, in the mean time a bell which he carryed about him did give a found, at which found the VVolf being affrighted ran away, which when he perceived, he founded the bell aloud, and fo drove away the wilde ravening bealt. As the Lion is afraid of a white Cock and a Mouse, so is the VVolf of a Sea-crab or shrimp. It is faid that the pipe of Pithecarie did repress the violence of VVols when they set upon him, for he founded the same unperfectly, and indistinctly, at the noise whereof the raging VVolf ran away; and it hath been believed, that the voyce of a finging man or woman worketh the same effect. Horace testifieth so much of himself, that by singing he drove away a VVolf, uin these verses :

Namq; me sylva Lupus in Sabina, Dum meam canto Lalagen, & ultra Terminum curie vagor expeditue, Fugit inermem.

Quale portentum neg; militaris Daunia in latis alit esculetis, Nes Juba tellus generat Leonum Arida nutrix.

If at any time a VVolffollow a man afar off, as it were treacherously to fet upon him suddenly and defroy him, let him but fet up a flick or flaffe, or fome fuch other knowledgable mark, in the middle space betwirt him and the VVols, and it will scare him away; for the suspensions beath feareth fuch a man, and thinketh that he carryeth about him fome engin or trap to take away his life: and therefore also it is said, that if a traveller do draw after him a long rod or pole, or a bundle of flicks and clouts, a VVolf will never fet upon him, worthily mistrusting some deserved policy to overthrow and catch him. Affeulapius writeth, that if a man do anoint himfelf with the fat or

fewet taken out of the reins of a Lion, it will drive away from him all kinde of Wolfs. There be fewet taken out or the reins of a Lion, it will salve from certain pieces of meat, and cast them abroad, some that take VVolts by poysoning, for they poyson certain pieces of meat, and cast them abroad, fome that take v vois by poyroning, to they die immediately. There were certain Countrey men which whereof when the Wolfs do eat, they die immediately. There were certain Countrey men which whereof when the works do eat, they do Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and carryed them up and down the firees pubbrought the skins of Wolfs into the City of Rome, and the Rome in the R brought the skins of vyons into the only skilled those Wolfs with the powder of a certain herb called liquely to be seen, affirming that they had killed those Wolfs with the powder of a certain herb called liquely to be teen, amriming that they man aimed they would kill Rats and Mice. Paufania faith, that Cardin Varim, and that therewithall also they would kill Rats and Mice. Paufania faith, that Cardus Varim, and that therewithan and they would at time the Inhabitants were fo annoyed there was a Temple of Apollo Lycem, at Siegon, and that on a time the Inhabitants were fo annoyed there was a 1 emple or Apollo Locay, at Carpon, and the by their flocks, whereupon Apollo taking pity of with Wolfs, that they could receive no commodity by their flocks, whereupon Apollo taking pity of with Wolfs, that they could receive no commonly by since of dry wood, commanding them to them, told them that there was in their Temple, a certain piece of dry wood, commanding them to them, told theu that their was in their added to powder, to mingle it with convenient meat pull off the rinde or bark of that wood, and beating it to powder, to mingle it with convenient meat for VVols, and so cast it abroad in the fields.

The people did as they were commanded by the Oracle, and thereby destroyed all the Wolfs: The people and as they were communities and any of the Priests of Siegon could declare. In but what kinde of wood this was, neither Paufanias nor any of the Priests of Siegon could declare. In but what kinds of world the Ewe-tree, and certain fragments of Juniper. The Spindle tree, and Ro. one part of the world the Ewe-tree, and certain fragments of Juniper. The Spindle tree, and Ro. one part of the world the Ewester, and their drink, and besides them we know no trees dodaphne do yeeld poyson unto VVols mixed in their drink, and besides them we know no trees dodaphne do yeerd poylon unto v vonstanable, especially V Volf-bane. And the occasion why there that are venemous, and yet plants innumerable, especially V Volf-bane. And the occasion why there that are venemous, and yet plants amount in the juyce or liquor whereby they are nourified, for are more poylonful herbs then trees, is in the juyce or liquor whereby they are nourified, for are more poyionium meros themetees, is in the payer it increases into a great tree, but where the juyce is wholesome and well tempered, there it increases into a great tree, but where it is imperfect and venomous, there it never groweth tall, nor bringeth forth any great

There are certain little Fishes called by the *Grecians*, Lycoi, and by the Latinists, Blennt, which we may English VVolf-sishes, and these the Hunters use to take Wolfs in this manner: when they have taken English v voir-nines, and there the faunters are of some tub or great mortar, and there kill them by a great many of them alive, they put them into some tub or great mortar, and there kill them by a great many or them anve, they put them the after of coals in the Mountains where the VVolls bruifing them to pieces, afterwards they make a fire of coals in the Mountains where the VVolls haunt, putting into the same some of these fishes mixed with bloud and pieces of Mutton, and so naunt, putting into the favour thereof carryed every way with the winde, they go and hidethemselves: whilest that in the mean time the VVols enraged with the savour of this fire, set to and fro to finde it, because of the smell, the fire before they come is quenched or goeth out naturally, and the VVolfs by the smoak thereof, especially by tasting of the sless, bloud and fish which there they finde, do sall into a drowsie dead sleep, which when the Hunters do perceive, they comeupon they finde, do sall into a drowsie dead sleep, them and cut their throats. The Armenians do poylon them with black fishes, and some dotakes cat, pulling off her skin, taking out the bowels, they put into her belly the powder of Frog, this Cat is boyled a little upon coals, and by a man drawn up and down in the Mountains where VVolfs do haunt; now if the VVolfs do chance to meet with the train of this Cat, they instantly follow after him, inraged without all fear of man to attain it, therefore he which draweth the Cat, is accompanyed with another Hunter armed with a Gun, Piftol, or Cross-bow, that at the appearance of the VVolf, and before his approach to the train, he may deftroy and kill

will not discourse of VVolf bane, commonly called Aconitum in Latine, wherewithall both men and beafts are intoxicated, and especially VVolts, but referring the Reader to the long discourse of Couradiu Gefner, in his History of the VVolf, I will only remember in this place an Bpigram of As-Soning wherein he pleasantly relateth a story of an adulterated woman, desiring to make away ber jealous husband, and that with speed and vehemency, gave him a drink of VVols-bane and Quickfilver mingled together, either of both fingle are poyfon, but compounded are a purgation, the Epigram is this that followeth :

Texica zelotypo dedit uxor macha marito, Nec fatis ad mortem credidit effe datum, Miscuit argenti letalia pondera vivi , Cogeret ut celerem vis geminata necem. Dividat hac ft quis, faciunt difereta venenum;

Antidotum fumet, qui sociata bibet. Ergo inter fele dum noxia pocula certant, Ceffit letalis nexa falutifera, Protinus & vacuos alvi petiere recesim, Lubrica dejectis qua vita nota cibis.

The enemies of Wolves.

Payloning of

Concerning the enemies of Wolfs, there is no doubt, but that such a ravening beast half sew friends, for except in the time of copulation wherein they mingle sometime with Dogs, and some time with Leopards, and sometime with other beasts, all beasts both great and small do avoid their fociety and fellowship, for it cannot be safe for strangers to live with them in any league or amity, feeing in their extremity they devour one another: for this cause, in some of the inseriour bealing their hatred lasteth after death, as many Authors have observed; for if a Sheep skin be hanged up with a Wolfs skin, the wool falleth off from it; and if an instrument be stringed with made of both these beasts, the one will give no found in the presence of the other; but of this main ter we have spoken in the story of the sheep, shewing the opinion of the best learned, concerning the truth hereof. The Ravens are in perpetual enmity with Wolfs, and the antipathy of their nature is so violent when the interest of the story of the sto is so violent, that it is reported by Philes and Elianus, that if a Raven eat of the carcase of a best which the Wolf hath killed, or formerly tafted of, the prefently dyeth.

There are certain wilde Onion's called Seille, and some say the Sea-Onion, because the root hith the similitude of an Onion, of all other things this is hateful to a Wolf, and therefore the American aus fay, that by treading on it his leg falleth into a cramp, whereby his whole body many times endureth insufferable torments, for the Cramp increaseth into Convulsions; for which cause it enumeer in the be observed how unspeakable the Lord is in all his works, for whereas the VVolf is an enemy to the Fox and the Turtle, he hath given secret instinct and knowledge both to this Beaft and fowl, of the vertuous operation of this herb against the ravening VVolt; for in their absence from their nests, they leave this Onion in the mouth thereof, as a sure gard to keep their young ones from the VVoif.

There are certain Eagles in Tartaria which are tamed, who do of their own accord being fee on by men adventure upon VVolves, and so vex them with their talons, that a man with no labout or difficulty may kill the beaft, and for this cause the VVolves greatly fear them and avoid them; and thereupon came the common proverb, Lupus fugit aquilam: And thus much shall suffice

to have spoken in general concerning their taking.

Now we will proceed to the other parts of their Hiftory, and first of all of their carnal copulati. Their copula on. They engender in the fame manner as Dogs and Sea-calves do, and therefore in the middle of lation and protheir copulation they cleave together against their will. It is observed that they begin to engender immediately after Gbrismass, and this rage of their lust lasteth but twelve days, whereupon there was wont to go a fabulous tale or reason, that the cause why all of them conceived in the inelvedays after Christmass was, for that Latona so many days together wandered in the shape of a the VVolf in the Mountains Hyperborei, for fear of Juno, in which likeness the was brought to Deim but this fable is confuted by Plutarch, rehearling the words of Antipater in his Book of Bealts. for he faith when the Oaks that bear Acorns do begin to cast their slowers or blossomes, then the Volves by eating thereof do open their wombs, for where there is no plenty of Acorns, there the young ones dye in the dams belly, and therefore such Countries where there is no store of Oaks, are freed from VVolves; and this he faith is the true cause why they conceive but once a year. and that only in the twelve days of Christmast, for those Oaks flower but once a year, namely, in the Spring time, at which feafon the VVolves bring forth their young ones. For the time that they go with young, and the number of whelps, they agree with Dogs, that is, they bear their young nine weeks, and bring forth many blinde whelps at a time, according to the manner of those that have many claws on their feet. Their legs are without Articles, and therefore they are not able to go at the time of their littering, and there is a vulgar opinion, that a she VVolf doth never in all her life bring forth above nine at a time, whereof the last which she bringeth forth in her old age is a Dog, through weakness and infirmity. but the Rhatians among whom VVolves do abound, do affirm constantly, that in the beginning of May, they bring their young out of their dens, and lead them to the water, sometimes seven and sometimes nine, every year encreasing their number; so that the first year she littereth one whelp, the second year two, the third year three, and so obserwith the same proportion unto nine, after which time she groweth barren and never beareth more: andit is faid when the bringeth her young one; to the water, the observeth their drinking very diligently, for if any of them lap water like a Dog, him the rejecteth as unworthy of her parentage, but those which fuck their water like a Swine, or bite at it like a Bear, them she taketh to her, and nourisheth very carefully.

We have faid already that VVolves do engender not only among themselves, but among other bealts, and such are to be understood of them which bear their young an equal proportion of time, as of Dogsand VVolves cometh the Lupus Canarius, or Panther, and the Crocuta. Of the Hyana and the Wolf come the Thoes, of whom we shall speak in their due place in the end of this story, and

the Hyanait self seemeth to be compounded of a Wolf and a Fox.

Concerning the natural disposition of this Beast we have already spoken in part, and now we will The Epithets adde that which doth remain; and first of all their Epithets which are attributed unto them among and natural feveral Authors are most clear demonstrations of their disposition; as sowre, wilde, Apulian, sharp, disposition, fierce, bold, igreedy, whoar, flesh-eater, wary, swift, bloudy, bloud-lovers, degenerate, hard, glutton, hungry, Cattle-eater, famishing, surious, yellow, fasting, ungentle, unhonest, untameful, harmful, Cattle-hurter, teeth-gnasher, insatiable, treacherer, martial, forrowful, mountain, nightly, robber, strate, ravener, mad, fnatcher, cruel, pack-bearer, bloud-sucker, foamer, proud, fearing, sullen, terrible, vehement, howling, and such other like belonging to the male Wolf. Now unto the female there are some peculiar ones also, as inhumane, ungentle, martial, obscure, rank, ravener, landed, Romulian, greafie, terrible, and Volfcan: and the ravening defire of this Wolf doth not only appear in the Proverbs of holy Scripture already repated, as where Christ compareth the Herevicks to Wolves, but also from hand instruments and sicknesses, for a little hand-saw is called of the Latinu and German: Lupus, a Wolf; because of the inequality of the teeth, wherewithal a man shearthasunder violently any piece of wood, bones, or such like thing.

There is a difease called a Wolf, because it consumeth and eateth up the flesh in the body next the fore, and must every day be sed with fresh meat, as Lambs, Pigeons, and such other things wherein is bloud, or else it consumeth all the flesh of the body, leaving not so much as the skin to cover the bones. Also the galls on a mans seat which cometh by Horse-riding, are by the Ancients called Lupi, and by Martial, Ficus, whereof he made this distichon;

Stragula succincii venator sume veredi Nam foles à nudo surgere ficus equo.

There be also instruments called Lupi, and Harpages, or Harpagenes, wherewithall Ankers are looked in the Sea, or any thing taken out of the deep. There is a certain territory in Ireland, (whereof Mr. Gamden writeth) that the Inhabitants which live till they be past fifty year old, are foolishly that the Inhabitants which live till they be past fifty year old, are foolishly that the Inhabitants which is the true cause whereof he conjectureth to be because for Mr. Gamaen writetin) that the inhabitant value whereof he conjectureth to be because for the reported to be turned into Wolves; the true cause whereof he conjectureth to be because for the reported to be turned into vyolves. the discase called Lycambropia, which is a kinde of melancholy causing most part they are vexed with the discase called Lycambropia, which is a kinde of melancholy causing most part they are vexed with the moneth of February to forfake their own dwelling or houses, and the persons so affected, about the moneth of February to forsake their own dwelling or houses, and the perions to anected, about the monette graves and fepulchres of men, howling and barking like to run out into the Woods, or near the graves and fepulchres of men, howling and barking like to run out into the vyous, of lignes of this difease are thus described by Marcellas: those sinh he Dogs and Wolves. The true fignes of this difease are thus described by Marcellas: those sinh he Dogs and woives. The true lightest pale, their eyes dry and hollow, looking drouffly, and which are thus affected, have their faces pale, their eyes dry and hollow, looking drouffly, and which are thus anected, have their tower all feabd, being very rough, neither can they foir and they foir and they foir and they foir and they cannot weep. I near tongue as it was breaking out of their bodies, especially on their legs; this difare very thirity, naving many meets breaming out the state of the stat ease tome can Lycaon, and memory times of facrificing of a childe, was by Jupiter turned into a is faigned by the Poets, who for his wickedness or facrificing of a childe, was by Jupiter turned into a wolf, being utterly diffracted of humane understanding, and that which Poets speak of him, my very well agree with melancholy, for thus writeth Ovid :

Territus ipfe fugit, naciufq; filentia ruris Exululat, fruftraq, loqui conatur.

And this is most strange, that men thus diseased should defire the graves of the dead. Like unto and this is another disease, called by Bellunensis, Demonium Leoninum, which is saith he, Consustantinals tius is another unicate, cantou by . Leone dillum videtur malum, quod co detenti alios homines ledan, 6 cum fallie malio, noxis & itacundis; à Leone dillum videtur malum, quod co detenti alios homines ledan, 6 cum jacus main, notin a transmit is, the Lian-devil difeafe is a confusion of reason, joyned with wrathful, and impious facts; and it feemeth to be named of Lions, because that such as are oppressed therewith, do rage against men, and wound them like Lions.

The apology of Wolves and Lambs.

there is a pretty Apology of a league that was made betwirt the Wolves and the Sheep, whereupon came the word Lycopbilios, my Author rehearseth it thus: Luph & agnit fadin aliquinwhereupon came the word Lycoponios, my rauthor remeatieth that he have a given jeum allemdo fuit, datie utring; obsidibus, Lupi suos catulos, over Ganum cobortem dedere. Quietie oribm as piemibus Lupuli matrum desiderio ulusatus edunt, tum Lupi irruentes sidem sadusq; solutum claintam, msq; canum prasidio desituius laniant, that is to say, There was a peace made between the Wolves and the Sheep, either fide giving hostages to other, the Wolves gave their young whelps, and the Sheep gave the Shepheards Dogs to the VVolves. Now when the young VVolves were among the flock of Sheep, they howled for their dams, which when the old VVolves heard, they came rufning in upon the Sheep, crying out that they had broken the league, and therefore they destroyed the Sheep in the absence of the Dogs that should keep them : whereby is notably fignified the simplicity of innocent men, and the impiety of the wicked, for whatfoever bonds of truce and peace are made with them, they ever respect their own advantage, taking any small occasion, like VVolves at the crying of their young ones, without all offence of the innocent and harmles, to break through the brazen walls of truce, peace, and amity, for the execution of their bloudy and ungodly mindes.

The particu-lar disposition of Wolves.

VVolves are truly faid to be fierce and treacherous, and not generous and bold, and noble like Lions. They especially rage in the time of their hunger, and then they kill not so much as will fuffice, but all the flock before them; but being fatisfied, as we have faid already, they frem rither Lambs then VVolves. The male is always as careful of the young ones as the female, for while the fuckleth her young ones, he bringeth meat unto her in the den, and when that they are greatly conftrained both to fly away, they carry their young ones along with them. Great is their malice toward them that hurt them, as Niphus faith, he tryed one day when he was a hunting near Rome, for his Dog was fighting with a VVolf, and he comming in with the multitude of Hunter, alighted from his Horse, and drew his sword, and gave the VVolf a wound, the VVolf feeling the froke of the sword for sook the Dog and turned upon the man, making all force at him he fould to bite him, but he professed he escaped with fingular danger, more by the help of his fellow hunters, then by his own valour; wherefore he concludeth, that as VVolves are enemies to all, fo they take special revenge of them that harm them, as we have said before of Lions. Some say that when many of them have obtained a spoil, they do equally divide it among them all, I am sure the likes reported betwirt the old Lion and the young, but whether it be true in VVolves I cannot tell, but rether think the contrary, because they are insatiable and never think they have enough. And the bertus faith, they do not communicate their prey like Lions, but when they have fed sufficiently, they hide the residue in the ground till they hunger again.

VVhen they fet upon horned beafts, they invade them behinde, and on their backs; when they fet upon Sheep, they choose a dark cloudy day or time, that so they may escape more freely; and to the intent that their treadings should not be heard, they lick the bottom or foles of their set, for by that means they make no noise among the dry leaves; and if going along they chance to brisk and for against their minds and they have a flick and for against their minds and they have a flick and for against their minds and they have a flick and for against their minds and the set of the set a flick, and so against their minde make a noise, then presently they bite their foot, as if it wet guilty of that offence : For the most part they fet upon such Cattle as have no Keepers, and the such as the such ven in secret. If they come unto a flock of Sheep where there are Dogs, they first of all confider whether they be able to make their party good, for if they fee they cannot match the Dog, they depart away although they have begun the spoil, but if they perceive their forces to beequal or superior, then they divide themselves into three ranks, one company of them killeth Sheep, a second company fighteth with the Dogs, and the third setteth upon the men. When they sneep, are in danger to be taken by the hunters, they bite off the tip of their tails, and therefore the Egypare in danger to be taken by the hunters, they bite off the tip of their tails, and therefore the Egypare in danger to be taken by the hunters, they bite off the tip of their tails, and therefore the Egypare in the tip of the tip of their tails, and therefore the Egypare in the tip of t are mans, when they would describe a man delivered out of extremity and danger, do picture a Wolf lacking that part of his tail. To conclude, when they are in peril they are extreamly tearful, attonifhed, and afraid, especially when they are unavoidably included they seem harmless, and this aroueth the baseness of their minde which is subtil, cowardly, and treacherous, daring do nothing but guern sielly, and not then neither, but upon a fingular advantage, and for the manifelting hereof. I will express these two stories following, as they were related to Gesner by Michael Herm, and Institute Goblerm. It happened (faith the first), that a certain Wolf constrained by famine. came unto a village near Millan in Italy, and there entred into a certain house, wherein sat the good wife and her children, the poor woman being terrified herewith, and not knowing what she did, ran out of the house, pulling the dore to after her, and so shutting the Wolf in among her children, at last her husband returned home, unto whom she related the accident, and how she had shut up the Wolf: the man being more afraid then was cause, lest the Wolf had devoured some of his children, enrered haltily in a dores, longing to fave and deliver his poor Infants, whom the fearful mother had lest with the Wolf, when he came in he found all well, for the Wolf was in worse case, astonished, amazed daunted, and standing like a stock without sense, not able to run away, but as it were offering himself to be destroyed : And this is the first history.

The second is like unto this, but more admirable, for the great Uncle of Geblerm, being marvelloully addicted to the hunting of wilde beafts, had in his land divers ditches and trenches cast up with other pits and caves wrought very artificially for the sase keeping of such beasts as should tall into them. Now it happed that upon one Sabbath day at night there fell into one of those pits three creatures of divers disposition, and adverse inclination, none of them being able to get out thereof: the first was a neighbors wife of his a poor woman, which going to the field to gather Beets and Rapes for her meat the day following, it fortuned that she fell down by a mischance into the faid pir, wherein the was fain to lodge all night (you must think with great anguish, forrow, and perillous danger to her self) beside that which her husband and family conceived at home, but she had not tarryed long in the faid pit ere a Fox was likewise taken and fell down upon her, now began her gief to be encreased, fearing lest the wilde best should bite and wound her, having no means to escape from him, nor no man to help and rescue her, although she cryed as loud as ever the could; wherewithal being wearyed, necessity made her to be patient, being a little comforted to fee the Fox as much afraid of her, as the was of him, and yet the thought the night full long, willing for the break of the day, when men ftir abroad to their labours, hoping that some or other would hear her moan, and deliver her from the fociety of fuch a Chamber-fellow: while thus she thought, striving betwixt hope, fear, and grief, lo what befel her more wofully then before, for suddenly a Wolf was taken and fell down upon her, then she lost her hope, and in lamentable manner thinking of husband and children, how little they conceived of her extremity, resolved to forsake the world, and commended her soul to God, making no other reckoning but that her diffressed lean limbs should now be a supper and breakfast to the Wolf, wishing that she might but feeher husband, and kifs her children before the loft her life by that favage execution; but all her wishes could not prevail, nor clear her heart from fear and expectation of an unavoidable death: while thus the mused, the saw the Wolf lie down, the sitting in the one corner, and the Fox resigns another, and the Wolf appaled as much as either of both, so the woman had no harm but an ill nights lodging, with the fear whereof the was almost out of her wits. Early in the morning came his great Uncle the Hunter to look upon his trenches and pits what was taken, and coming unto that pit, he found a treble prey; a Woman, a Wolf, and a Fox; whereat he was greatly amazed, and stepped a little backward, at the first sight the woman seeing him cryed out, caling him by his name, and praying his aid . he knowing her by her voyce, prefently leaped down into the pit, (for he was a valiant man) and with his weapon first slew the Wolf, and then the Fox, and so delivered the woman from the fear of them, yet there was forced to leave her till he went and fetched a ladder, for the was not able to come forth as he was; then having brought the ladder, he went down again into the pit, and brought her forth upon his shoulders, in that manner delivering ber fafe to her husband and family. Now these two stories do plainly set forth, that a Wolf dareth do nothing when he is in fear himfelf.

It hath been a question whether Wolves can be tamed or no, some say that they are always wilde Of tamed and can never be tamed. Albertin writeth, that being taken whelps, they are tamed and will play Wolves. like Dogs, yet he faith, they never forget their hatred against the Hunter and the desire of Lambs or other beafts which are devoured by Wolves, when soever he goeth abroad. And Siumpfius writeth, that even when they are tamed, they are angry with their Masters that look upon them while

Sneb, writeth a fable of two Woods among the ancient Veneti, one of them dedicated to Juno, and the other to Diana, and he would make the world believe, that therein the Wolves lived peaceably and gently with the Harts, and did come to the hands of men like familiar and tame Dogs, fuffering themselves to be stroked with their hands. Elianus and Siephanus do say, that near the plan of Meotis, there are Wolves which live like tame Dogs with men, being continually conterfant among the Fishermen, and these VVolves do part stakes and divide their prey with

Albarius.

The Wolf

the inhabitants dwelling upon the Sea-shores, and there is such a mutuall charity and commons ob. the innabitants awening upon the Sta-Holes, and the Wolves take fishes when the men take none, ferved betwixt them and the men, for sometimes the Wolves take fishes when the Meline take none, served Detwink them and the them, for tometimes the men take fishes when the Wolves have none; and then they part with the Wolf, sometimes the men take fishes when the Wolves have none; and and then they part with the won, jointenance like confederates, each one relieving and helping other; thus they live together in quiet manner like confederates, each one relieving and helping other; thus they live together in quiet manner have comeastace, and do not give them a share, they recompense but if the men at any time break with the Wolves, and do not give them a share, they recompense but it the men at any time oreas with the violes, and their nets: which thing if it be true, is a finguitheir ingratitude and falshood with tearing in pieces their nets: which thing if it be true, is a finguitheir ingratitude and falshood with tearing in pieces their nets: their ingratitude and iaimoud with tearing in pieces their as primitively ordained by God to be belar example of that rare concord and agreement which was primitively ordained by God to be belar example of that fare concord and agreement which was possible by God to be betweet man and beaft: Some fay, these kinde of Wolves be Otters, but I rather believe that they

be Sea-wolves, of whom we shall talk presently.

Sea-woives, or whom we man this presently.

There be many magicall inventions about the parts of Wolves, namely, their heads, teeth, ears, I here be many magical inventions about the patts of violes, because I cannot tell what benetails, and privy parts, which I will not hand to recite in this shade, Wolves are subject to the same fit shall come to the knowledge of them by the English Reader. Wolves are subject to the same fit shall come to the knowledge of the single of the throat, madnesse, and the gout: when they diseases that Dogs are, especially the swellings of the throat, madnesse, and the gout: when they are fick, they eat of an herb which makes them cast, some say, it is ground Ivy, some say it is graffe are next, they eat of an nert which make they have a pain in their bellies, and not otherwise, and fome otherwise, of this they eat when they have a pain in their bellies, and not otherwise. and some otherwise, or this they cal when they have a part of the reason why Dogs and Wolves are more subject to madnesse then any other beast, is because The reason why Dogs and vvolves are more and decrease with the Moon. If a man be buten their bodies are cholerick, and their brains increase and decrease with the Moon. If a man be buten their bodies are choierick, and their brains increase and decrease when a man be bitten by a mad Wolf, he is to be cured by the fame medicines that are applyed to the bitingsofamad Dog. They live very long, even until they lofe their teeth, therefore in their oldage oppressed Dog. They live very long, even until they lote their teeth, they have no friends but the Parrots, with famin they flie unto Cities and houses to seek meat. They have no friends but the Parrots. A Wolf was once the part of the Arms of Rome; and the Judgement-feat at Athens had in it the Picture of a Wolf. There were ancient Coins of money stamped with the image of a Wolf, both ha h no friend among the Greelans and among the Romans, which were therefore devised, because Romain and Rebut the Parrot. among the Grecians and among the Levinant, with the skins of Wolves after they were dressed by Cur. mm were late to be nurted by a violity with the small great Princes and Noble menwere riers, we do read that there were garments made, wherewithall great Princes and Noble menwere cloathed, the bare being inward next to their bodies, and the rough being outward, these were used in journeys and huntings, and they were the proper garment of the guards of Tyrants. And this shall suffice of the vulgar Wolf.

Of the SEA-WOLF.

Lthough nothing hath hitherto been brought to light concerning the Sea-wolf of hearing writers, that I know, yet his form is notable to be observed; and you may chilf whether you will call him a Thief or a Sea monfter, much differing from the Wolf fifth, as that he feemeth to challenge a particular description or treatife. It is also a Four-footed beast that liveth both on se and land, fatisfying his hunger on the most part upon fishes: It hath been seen upon the Bilitat Ocean shoar, and it doth resemble the Wolf that liveth on the land, that it is not undelervely

It doth live also a long time being tamed, it hath a dangerous head, and very many hairs growing on both sides of his eyes to shadow them, his nostrils and teeth are like unto a Dogs, and in the like unto a Dogs, and in the like unto a like unto a long, and in the like unto a long, and it is not the like unto a long, and it is not the like unto a long, and long the like unto a long time being tamed, it hath a dangerous head, and very many hairs growing on both sides of his eyes to shadow them, his nostrils and teeth are like unto a long time being tamed, it hath a dangerous head, and very many hairs growing on both sides of his eyes to shadow them, his nostrils and teeth are like unto a long, and long time being tamed, it has no strill a long time being tamed, it has no strill a long time being tamed, it has no strill a long time being tamed, it has no strill a long time being tamed, it has no strill a long time being tamed. ftrong hairs growing about his mouth: also small briftles growing upright upon his back: and adorned and marked on every fide with black diffinct spots, a long tail, thick and hairy, all the other parts being like to a Wolves, as you may eafily fee by this expressed Picture: and unto this belong eth the flory of the Wolves laft before expressed, which live upon fishes, and divide them familian with men.

Of the THOES.

Here are two kinds of Thoes, as there are of Panthers, differing only in magnitude or greatness. But the leffer Thoes is like unto the leffer Panther, a Lycopanther, and the Lupm canarum engendered betweet a VVolf and a Dog, are all one four-footed beaft. The Thoes also are a kinde of VVolf. And. Bellu. And again there is a kinde of VVolf which Ariffotle doth call Chabez, but Avicen doth write, that it And again to be called Bernet, in the Persian tongue. And again in another place, where he doth write, that ought to be called Bernet, in the Persian tongue. And again in another place, where he doth write, that the Lion and the Thoes are utter enemies, and Albertus doth translate it, that a VVolf doth fight with the four-footed beaft Tobox, which is a corrupted word, Tobox for Thoes, as Cabex for Thohox, and this fome men think to be the Lynx. Thoesis called in Hebrew, Tabas; Alfbali is a four-footed beaft like 10 Me Wolf. Adeditach is also a kinde of Wolf, but I do not know whether these names belong only to the Thoes, or to any other kinde of Wolf. Selinus doth call Thous Æthiopian Wolves, and a little before he said that Lycaon was an Ætbiopian Wolf, mained on the neck, and so divers coloured that a man would think there were no colors wanting in them.

The people of Scymia likewise say, that the Buff doth change his colors, neither is there any other healt covered with hair, except the Lycaon among the Indians, (as Pliny also writeth) and belides this there is no mention made of the Lycaon among all the ancient writers. Lycaons are called Dogs, in the fory of the diversities of Dogs. The lesser kinde of Thoes are the best, for some make two kinde of Thos, and fome three, and these like birds, and other four-footed beafts, change their color, both in Winter and Summer, fo that sometime they appear bare, and again at other times rough all over, that is bare in the Summer, and rough in the Winter, but it doth plainly seem that there is no more kinde of Thoes but one, which the things that come after doth prove and make manifest. Nearchus faith that those Tigers are not true Tigers, which are commonly called Tigers, but changeable Thoes (as if that every Thoes were not changeable) and greater then the other Thoes.

They have no reason which take the Lupus cervarius for a Thoes, which we have already shewed to be a Lynx for the Rhatians which speak Italian, & the Savoyans do to this day call him Cervario, and for the Armenian Wolf the Cicatus, and the Lupus Canarius we have already shewed, that it is a Panther. and therefore it is needless to stand any longer upon those names in this place. We will therefore take it for confessed, that the Thoes is a beast engendered betwixt a Wolf and a Fox, whereof some are greater and fome are smaller, and these are found about the Mountain Pangew, Cittus, Olympus, Myfim, Pindus, and Nifa, beyond Syria, refembling for the most part a Hyana, having a longer body, and aftraighter tail then a Wolf, and although it be not so high of stature, yet it is as nimble and as frong as is the Wolf, and it seemeth that the very name Thoes is taken from the celerity and swiftnesin running and leaping, for it getteth his living by the quickness of his feet. In the outward face is much resembleth a Wolf his Father, but iin spots and length of his body it resembleth a Panther his Mother; they couple in generation like Dogs, bringing forth two or four at a time, like Wolves, which are blinde, and their feet cloven into many toes.

They are enemies to Lions, and therefore they do not live in the same place where Lions are, not only because they live upon the same victuals and food, but also because they are a more pitiful creature then they, especially to man, for if they see the face of a man at any time, they run unto him and do him all fuch reverence as their brutish nature can demonstrate.

And further Philes and Selius write, that if they fee a man oppressed by any other beast, they run and fight for him, although it be with the Lion, not sparing to offer their own lives, and to spend their dearest bloud in the defence of him, who by fecret instinct of nature they understand to be ordained of God, the King and chiefest of all worldly creatures: therefore Gratius called this kinde, &miferam, Thoem de fanguine prolem, and of their taming and fighting with Lions, he speaketh:

> -Thoes commiffes Leones Et subiere affu, & parvis domuere lacertie.

They live for the most part upon Harts, whom they take in the swiftness of their course, these they bite and fuck their bloud, then fuffering them to run away to some Mountains, thither they follow them and take them the second time, not destroying them all at once, but by distance of time, whereby the Harts bloud groweth sweeter unto them, and they have the better appetite thereunto to detroy them. The Lyco panthers, and also the beast Pathyon, whereof Albert in speaketh, I do take to be two several distinct beasts from the Thoes, although the quantity and stature agree, and I see no cause if there be any such beast in the world, but that we may truly say they are a lesser kinde of Panthers: And this shall suffice to have said of these beasts, which are deemed to be of the kinde of Wolves, wherein we have endevored to fay fo much of the general and special as we could collect out of any good Authors; and thus we will that up the story of the Wolf with a short remembrance of his medicinal vertues.

The Medicines of a Wolf.

A Wolf being sodden alive until the bones do only remain, is very much commended for the pains of the Gout, or a live Wolf steeped in Oyl and covered with Wax, is also good for the same dis-

Blondus.

The skin of a Wolf being tafted of those which are bit of a mad or ravenous Dog, doth preserve The skin of a Wolf being tatted of those which was The skin of a Wolf is very profitable for those them from the fear or hazard of falling into water. The skin of a Wolf is very profitable for those them from the lear or nazard or ranning into water.

which are troubled with the winde colick, if it be bound faft about the belly: and also if the person which are troubled with the winde collen, it will much avail him. If any labouring or travelling man doth to affected doth lit upon the 1aid skin it will inden a feet pain or trouble him. The skin of a Wolf about his feet, his flooes fhall never pain or trouble him. The skin of a Wolf wear the skin of a worr about his rectains income man it hath the natural heat in it, and rowled about being new plucked off from him, and especially when it hath the natural heat in it, and rowled about the member where the cramp is, is very effectual against it.

e member where the cramp is, is very elected a gain the leafnels of the bloud of a Wolf being mixed with Oyl, is very profitable against the leafnels of the ane bloud or a wolf being initial with the commended, for those that are troubled with the Co.

k and stone. The bloud of a Buck, Fox, or Wolf being warm, and fo taken in drink, is of much force against the the bloud or a Buck, rox, or work being warm of a Wolf well tempered and fodden, will keep him difeate of the ftone. He which doth eat the skin of a Wolf well tempered and fodden, will keep him difeate of the itone. He which doth cat the said the fact the said the first fact the said the first fact the fact the said the fact the said the fact the f taken in meat, doth help those that are things in the chapter going before, concerning remedies of the ation of children. You may read more things in the chapter going before, concerning remedies of the flesh of a Wolf taken in meat. The fat of a Wolf is no less efficable, then the flesh.

The fat of a Wolf doth very much profit, being anointed upon those whose joynts are broken.

Some of the later writers were wont to mingle the fat of the Welf, with other Outments for the some of the later writers were wone to mingle it with other Ointments, for the Pallie. It doth foften allo difease of the Gout. Some also do mingle it with other Ointments, for the Pallie. It doth foften also the Uvula, being anointed thereon. The fame also being rubbed upon the eyes, is very profitable for the bleardness or bloud-shot of the eyes. The head also of a Wolf is very good for those that are weak to fleep upon, being laid under their pillow. The head of a Wolf being burned into after, is a weak to neet upon being laid under the The right eye of a Wolf being falted, and bound to the body, special remedy for the loofiness of teeth. The right eye of a Wolf being falted, and bound to the body, doth drive away all Agues and Peavers. The eye of a Wolf being rubbed upon the eye, doth diminish all difeases that rise in the fight of the eye, and it doth also take away all marks or prints being made with hot Irons. The right eye of a Wolf also is profitable for those that are troubled with flitches on the right fide of the belly; and the left eye of a Wolf for pains on the left fide. The right eye of a Wolf is very good against the bitings of Dogs. Also the eye of a Wolf is much commended for those that are Lunatick by the bitings of Dogs.

The teeth of a Wolf being rubbed upon the gums of young Infants, doth open them, whereby the teeth may the easier come forth. Again, the gums of children are loofened with the tooth of a Dog, being gently rubbed thereon, but they are fooner brought forth with the teeth of a Wolf. Somemen do commend the tongue of a Wolf to be eaten of those that are troubled with the Falling fickness. The artery which fpringeth in the throat of a Wolf being taken in drink, is a most certain cure against the Squinfie. The throat of a Wolftaken in drink, is very much commended for those that are troubled with the Falling-sickness. The lungs or lights of a Wolf being sodden and dryed, and mingled with Pepper, and so taken in milk is very profitable for those that are puffed up or swoln in the belly. The heart of a Wolf being burned and beaten to powder, and so taken in drink, doth help those

that are fick of the Falling-fickness. Take one ounce of the gum of an Oak, and half an ounce of the gum of a Pear-tree, and two drams of the powder made of the top of a Hart-horn, and onedram of the heart of a Wolf, all which being mingled together, and made into medicine, is always used for the cure of all ulcers: but it will be more effectual if thou dost add thereto the hinder-part of the skull of a man beaten to powder. The Liver of a Wolf is of no less vertue then the Lungsor Lights, which I have manifested in the medicines of the Fox. The Liver of a Wolf helpeth or profiteth those that are fick of the Falling-ficknes. The Liver of a Wolf being washed in the best white wine, and to taken, is very good for those diseases that arise in the Liver. The Liver of a Wolf mixed in the medicine made of Liver-wort, is very much commended for the diseases in the Liver. Galen also doth fay, that he hath holpen those which have been diseased in the Liver, only using the medicine made of Liverwort, and he faith, if he did apply any other medicine thereto, it did little or nothing at all pro-

The Liver of a Wolf is very profitable for those that are troubled with the scurse in the mouth. The Liver or laps of a Wolf is much used for those that are troubled with diseases in the Liver; but you must dry it and afterwards beat it to powder, and so give the party so affected one dram of it in fweet wine. The Liver laps of a Wolf faith Marcellus, being dryed and beaten to powder, and a little part of it mingled in like portions with the powder made of Fenegreek, of Lupines, Wormwood, and of the herb called Herba Marie, and so mingled that it may be about the quantity of a cup full, and so given him that day which he is not troubled with the Feaver, but if he shall be troubled with it, let him take it in water for the space of three days, and after he hath drunk it, let him lie for the space of half an hour with his arms spread abroad : and afterwards let him walk very often, but est very feldom, and let him be fure he keep himself for the space of those three days well ordered, and from drinking any cold drink, or eating any falt or fweet thing, and within a little space after he shall be from the first fr be freed from that disease. The Liver laps of a VVolf being wrapped in bay-leaves, and so set to dry at the Sun or at the fire, and being dryed, beat it to powder in a Mortar, first taking away the leaves very warily, which being powdered, you must keep it in a clean vessel, and when you give it him to drink, you must adde thereto two leaves of Spoonwort, with ten grains of Pepper beam very small, and as much clarified Honey as is needful, and also made hot with a hot burning from and mingled very diligently in a Mortar, which being so warmed, you must give him to drink string right up in his bed, that after he hath taken the potion, he may lye down on his right fide for the Avicen. foace of an hour, drawing his knees together, and after that he hath done fo, let him walk up and down for the space of an hour, and this will likewise cure him of the same disease.

Of the Wolf.

down for the ipact of an addicine concerning the cure of the hardness of the Liver, which is, Take Opium, Henbane, Oyl made of Beavers stones, Myrrhe, Sastron, Spicknard, Agrimony, the Liver of a Wolf, and the right horn of a Goat burned, of each equal parts, and make thereof a medicine. The Dioscorides. Liver of a Wolf being made in the form of a dry Electuary and given as a Lozeng, doth also very much profit against the disesses of the Liver.

Guerra Philosopher do th affirm, that the Liver of al living beafts doth very much profit against all Galen. nains of the Liver. The Liver of a Wolf being throughly dryed and drunk in sweet Wine, doth mi- Plun. reste all griefs or pains of the Liver. The Liver of the same beaft to the quantity of a penny, taken in a pince of fweet Wine, is very medicinable for the curing of all pains in the Liver what foever. The Liver of a Wolf being taken in hot wine, doth perfectly cure the cough. If an intolerable cough doth ver any man, let him take of the Liver of a Wolf, either dryed or burnt, as much as he shall think convanient, and therewith let him mingle wine, honey, and warm water, and afterward drink the amefalting every day, to the quantity of four spoonfuls, and he shall in short space be cured of the

The laps or fillets of a Wolves Liver, being applyed unto the fide, doth perfectly heal any stitch or pricking ach therein. The Liver of a Wolf being taken in sweet wine, doth heal those which are trouhed with a Tifick. The Liver of a Wolf being first boyled in water, afterwards dryed, beaten and mingled with some certain potion, doth instantly heal the grief and instanation of the stomach. The nowder of a Wolves Liver mingled with white wine, and drunk in the morning for fome certain days together, doth cure the Dropfie. The Liver of a Wolf taken either in meat or drink, doth affwage the pains of the secret parts. Two spoonfuls of the powder of a Wolves Liver being given in drink. doth cure all pains or fores of the mouth. The gall of a Wolf being bound unto the navel of any man, doth loofen the belly.

The gall of a Wolf taken in wine, doth heal all pains in the fundament. The entrails of a Wolf Sylvius. being washed in the best white wine, blown upon, dryed in an Oven, pounded into dust, afterwards Albertus. rowled in Wormwood, is a good and effectual remedy against the Colick and Stone. If some part of theyard of a Wolf being baked in an oven, be eaten by any, either man or woman, it inflantly firreth them up to luft. Concerning the genital of a Wolf I have spoken before in the medicines of the Fox. but antiquity, as Pliny faith, doth teach that the genital of beafts which are bony, as Wolves, Foxes, Ferrets, and Weafels, are brought to an especial remedy for many diseases. If any man take the right hone of a Wolf, being bloudy, freep it in Oyl, and give it unto any woman to apply it unto their fecret parts, being wrapped in wooll it instantly causeth her to sorsake all carnal copulation, yea although hebea common ftrumpet. The same being taken in some certain persume, doth help those which Marcellus. are troubled with the foul evil.

Theeyes being anointed with the excrements of a VVolf, are instantly freed from all covers or fpreading skin therein. The powder of the same VVolf being mingled with the sweetest Hony as can possible be had, and in like manner rubbed or spread upon the eyes, doth expel all dazeling from them. The fime of a VVolf long rubbed, until it be very light, being mingled with Honey, by the un- Galen. dion thereof, causeth the filth or scurfe growing about the eyes to avoid away, and restoreth them to an exceeding clearness. The powder of a VVolves head being rubbed upon the teeth, doth make fall and confirm the loofeness thereof, & it is most certain that in the excrements of the same beasts. there are certain bones found, which being bound unto the teeth, have the same force and efficacy.

The dung of a VVolf or Dog being beaten into small powder, mingled with Honey and anointed upon the throat, doth cure the Quinfie or Squinanfie as also all other fores in the throat what soever. The time of a VVolf being given to those which are troubled with the Colick to drink, doth easily cure them, but this dung is more effectual if it have never touched ground, which is very hard to come by, but it is found by this means. The nature of the VVolf both in making his water, as also in voiding his excrements is like unto a Dogs, for while he voideth his water he holdeth up his hinderleg, and voideth his excrements in some high or steepy place far from the earth, by which means it fileth down upon bufhes, thorns, fruits, elder-trees, or fome other herbs growing in those places, by which means it is found never touching the earth. There is furthermore found in the fime of VVolves train bones of beafts which they have devoured, which for as much as they could not be grinded or chawed, so also can they not be concocted, which being beaten and bruised small, are by some commended to be excellent given in drink for the ease of the Colick, but if the grieved party shall besome fine or delicate person which cannot endure so gross a medicine, then mingle it with Salt, Pepper, or-some such like thing, but it is most often given in sweet wine, so there be but a small quantity thereof drunk at one time.

But his dung which the Gracians call Lagonas, and is to be applyed to the groin of the diseased person, ought to be hanged in a band made of wooll, but not of any wooll: But it would be more effectual if it were made of the wooll of that Sheep which was flain by a VVolf. But if the same cannot be got, then is it fir that there be two bands, one which may be bound about the groin, and another which may be bound upon the dung to keep it from falling.

There are also some which cast a small quantity of the same dung to the bigness of a Bean in a little 70t, fastening the same to any one which is troubled with the faid difease, and it healeth them (which

The History of Four-footed Beasts.

in a manner feemeth incredible) in very short time. The dung of a Wolf boyled in small white wine. in a manner leemeth increasible, in very most time. And afterwards taken in drink, is very profitable for those which are troubled with the colick: and and afterwards taken in drink, is very profitable for those which are troubled with the colick: and and afterwards taken in drink, is very promeane for those with the skin of the same beast, and hung upon it is also reported that if the same dung be covered with the skin of the same beast, and hung upon it is also reported that it the lame using be tovered with a thread made of the wooll of a the thigh of any one which hath the colick being bound with a thread made of the wooll of a Sheep sain by a Wolf, it will instantly cure the said disease.

neep flain by a Wolf, it will initiality cute the land upon the earth, but upon fome trees, Brambles, or The fime of a Wolf, fo that it be not found upon the earth, but upon fome trees, Brambles, or The time of a vyoir, to that it be not found upon the arm of him that shall be trou-Bulrushes, being kept, and when there shall be need bound unto the arm of him that shall be trou-Bultushes, being kept, and when there man be need bound unto the actu of multipat that that betroubled with the Colick, or to his neck being included in a bone, or in Copper, and hung with the bled with the Colick, or to his neck being included in a bone, or in Copper, and hung with the thread wherewith filk-women weave, doth wonderfully and most speedily cure him, so there be thread wherewith filk-women weave, be a little of the same dung given to the grieval. thread wherewith mik-women weave, and wonderlying and more specially care him, so there be great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there be a little of the same dung given to the grieved party to great care had, that in the mean time there had a little of the same dung given to the grieved party to great care had, the great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of the grieved party to great care had a little of drink, not knowing what it is. The using or a vivol being taken and the bones therein betten into powder, mingle therewith cold water, giving it to any one to drink which is troubled with the Stone, powder, mingle therewith cold water, giving it to any one to drink which is troubled with the Stone,

The dung of a Wolf beateninto the smallest powder then strained and given unto any inhis sit and it will instantly cure him. The dung or a won peacement the interior of half a spoonfull in hot water, is a very effectually which is troubled therewith to the quantity of half a spoonfull in hot water, is a very effectually which is troubled the entire to the bones which are found in Wolves, being bound unto the and approved cure for the Stone. The bones which are found in Wolves, being bound unto the and approved cure for the Stone. The bolick, having never touched the ground, do with arm of any one which is troubled with the Colick, having never touched the ground, do with arm of any one which is troubled with the College, and the found in the dung of a Wolfsbeing great speed and celerity cure him. The pastern bone of a Hare found in the dung of a Wolfsbeing great speed and celerity cute him. I he pattern bound with the colick, doth very effectually bound unto any part of the body of him which is troubled with the colick, doth very effectually bound unto any part of the body of mill white is troubled with the contain the dung of a Wolf with the hairs of a white Affe, taken by any woman in a certain cure him. The dung of a Wolf with the hairs of a white Affe, taken by any woman in a certain

persume, maketh her apt for conception. The teeth of a Wolf are unequall, wherefore their bitings are very dangerous. A ravening Wolf by his biting bringeth the same danger, as a ravenous Dog, they also are cured by the same medicins, by his biting bringeth the same danger, as a ravenous Dog, they and are cured by the same medicins, as we have declared at large in the story of the Dog. The wounds which come by the tenhormis of a Wolf are very dangerous, for the filth which pierceth through all clouts or spungs which or a vyon are very unngerous, for the first which pieroest carough an clouds or ipunge which are laid upon them: But they are cured by no other means then the bitings of Dogs: Anjude writesh these things concerning the biting of a Lion, and not of a Wolf.

Johannes Vitte the Hungarian declared that there were certain men in Hungary bitten by a mad Wolf, and that they were as it feemed prefently cured: But before forty dayes expired they all died by a most bitter or painfull disease, small pieces of flesh encreasing through their urine in the some by a most pitter or paintain disease, main pieces of neint entereating through their units in the form of Dogs, with an exceeding pain or torment. It is also reported of a certain Countreyman, who when he had striken a Wolf with his Club, and the Wolf had so torn his face with his nails, that he pulled off the skin, he was in short time healed that there appeared no sign of any harm, but in thort time after he began to be fick, and to how! like unto a Dog, and fo perished; by which it was conjectured that that Wolf was mad. An Oxe being bitten by a mad Wolf or Dog is cured by Garlick, being beaten and rubbed upon the wound: the Wolf himself is also healed of any wound by old falt flesh applyed unto the same. Two drams of Gentian being drunk in wine, is an excellent out fait nem applyed unto the faith. Two drains of Gentian being at disk in which, is an extendit cure for the bites of a mad Dog and ravening Wolves, as also of all beafts tearing with their teach or nails. The bites of Wolves being marked in the bodies of any Cattell, are burned or feared with 4 hot Iron, left that the biting be affiredly hurtfull, may draw unto it self corruption. And thus much shall suffice concerning the medicines of the Wolf.

Of the ZEBEL, commonly called a SABEL.

A Mong all the kindes of Weafels, Squirrels, Wood-mice, wilde Mice, or other little beals of the world, there is none comparable to this Zebel, commonly called in Latine Zebelm and Zobela, from whence the Germans call it Zobel, the Illyrians and Polonians, Sobol and Sobol, the Italian, Seft, and Sablines: The skins hereof are called Zebelline, and Zobelline, and fometimes Zibelline. Itis bred in Mulcovia, and the Northern parts of the World, among the Lapones, but no where more plentifull then in Tartaria, Soylbia, and Sarmatia, and it is therefore called by fome Mu Scythia, the Scythian Mouse. The French men because of the similitude it hath with a Martin, do call it by a conpounded name, Marteis Soublineis. It liveth for the most part in the Woods, being leffer then a Martin every way, and hath also shorter legs: They run up and down upon trees like Squirrels, eafily fastning their clawes in the boughes; when they leap, their tail ferveth them instead of across Beam to direct them. They bite most irefully, for their teeth are as sharp as Razors, and there is no beaft in the World of their quantity so angry and terrible as they: their flesh is unprofitable and good for nothing. The only price and estimation of this beast is for the skin, which farrestxelleth all the skins of the World, either Ermins, Martins, or Foines, differing herein from the Martins, because their hair is thinner, and if you froke them from the head to the tail, or on the contrary from the tail to the head, they do lie every way fmooth, whereas the Martins do only fall smooth

Thefe are more subject to Worms then other skins, except they be continually worn, or laids? from the head to the tail. with bunches of Wormwood; but above all other things the laying of them open one day together in the first the laying of them open one day together in the first the laying of them open one day together the laying of ther in the Sun or air, doth him more harm then a whole years wearing, for the beaft it fell inch. evermore in fladowy places, forbearing the fun except she be hunted, and catcheth small birds in fecret. In the furthest part of Lituania they have little or no money, and therefore the Merchants which traffique thither do exchange their wares for Zebel or Sabel skins; those are the belt which had have most white and yellow hairs mingled in them, and the Garments of Princes are only fringed nave most with these Sabel skins, and honourable Matrons, ancient Noble men and their Wives do and there will all there of these to wear about their necks; for it is certain that a garment of these skins is much dearer then cloth of Gold, and I have heard and also read, that there have been two

thousand Duckets payed for so many as were put in one Cloak.

It is a very libidinous and lustfull beast, and at that time stinketh very rankfully, wherefore it mingleth it felf with Martins of all forts that it meeteth. And thus much shall suffice to have dicoursed of this little beast. Now there are divers other which seem to be of this kinde, of which though I have not much to fay, yet rather then they should be omitted, I will expresse their bare names, that so I may give occasion to all our Countrey-men that shall travail into other Nations. name, make enquiry after them, that fo at their return, if they have any conscience of publique good. they may get themselves eternall same and names, by communicating publiquely their own knowledge, experience, and learning, which they have gained in these, or other Four-sooted beasts.

Of the NOERTS.

His beaft is of the quantity of a Weasel, and by the Germans called Noerts, and Nerts, from which word the Latines have their Noerza, for this beaft. It liveth (as Georgius Agricola writeth) in the Woods, betwixt Swevia and Vistula, the colour of the hairs which is short and smooth, is for the most part like an Otters. Their skins are fold at Franckford by forty in a heap or bundle, they are long, and more red then the Ferrets, every bundle most commonly is fold for fix and twenty Nobles. Some think that this is the Latax, spoken of before, because it getterh his living in the wa-

Of the VARMEL.

His bealt is called by the Latines Vormela, by the Germans Wormiein, it is leffe then a Ferrer, the belly whereof is black, all the refidue of the skin full of white, pale, red, and yellow spots. which adorneth it in admirable manner, very comely and excellent to be looked upon, the tail not path half a hand breadth long, the tip whereof is black, but the hairs of the refidue mixed with white and ash colour together.

There is another beaft which for the variety of the colours, which are apparent in his skin, he is called a Salamander, not that which liveth in the fire, but one like unto it, having a gentle hair, difinguished all over into black and yellow spots, and these because of our ignorance we reckon among

our outlandish Weafels.

In India there is a little beaft called Chiurca, having a very precious skin, and this (as Cardan writeth) hath a bag under the belly, wherein it suffereth his young ones to go in and out, as before we have

faid of the Simivulpa, or Foxe-Ape.

There is another little beaft in Hungaria, called Unoken, which dwelleth in holes of the earth as Conies do, the outward proportion whereof is like a Weafel, but it is much thinner and longer, the colour of the back is red, and all the refidue of the body Mouse colour, Now although I'do not read any speciall use of the skin of this beast, yet I thought it good to name it in this place, because it is reported that the breathing thereof upon the face of man is venemous and poysonfull, for when Souldiers sleep in their tents upon the earth, they come many times and look in their faces and poyson them: And thus much for the Zebel, and the severall kindes of this little beaft.

Of the ZIBETH, or SIVET-CAT.

The best description that is of this beastin all the World, that I could ever finde, was taken by Doctor Gay, and thus sent as it is here agared to Doctor Gayer with these words following. There came to my sight (saith Doctor Cay) a Zibeth or Sivet very lacely, which was brought out of diese, the picture of the said of the taken which is this pressed. thies, the picture and shape whereof in every point I caused to be taken, which is this prefixed, that one Egge is not more like another, then this is to the faid Sive or Zibei. It is greater then

Avicenna.

The History of Four-footed Beasts.

any Cat, and leffer then a Taxus, having a sharp face like a Martin, a short, round, blunt ear, which any Cat, and letter then a Taxus, naving a mary two and blew sky-coloured eye, a foot and leg black was black without, but pale within, and on the brims a black claws neither fo crooked space leg black was black without, but pale within, and on the brinis a black claw, neither fo crooked, nor fo hid in the and more broad or open then a Cats: Likewife a black claw, neither fo crooked, nor fo hid in the and more broad or open then a Cats: Linewill and horrible. It is all spotted over the body foot as it is in a Cat, but their teeth are more fearfull and horrible. It is all spotted over the body foot as it is in a Cat, but their teeth are more reasonable the upper chap pale, and the middle part black, and but the nofe thereof is black, the nether part of the upper chap pale, and the middle part black, and but the nose thereof is black, the nether part or the upper chap pare, and the mode part black, and from thence to the top of the head it is of the colour of a Badger. The lower chap was all black, and the briftles of the upper chap were white, growing forth of a pale skin, and a little above the

and the briftles of the upper chap were write, growing total of a pair sain, and a little above the eye there were two other white ones growing forth of a black skin.

The throat thereof was black, and a little above the eye there arise three black lines or firakes, whereof the first or uppermost descendeth down right to the throat, the second descendeth comwhereof the first or uppermost descendeth down right to the throat, the second descendeth compasses in and out to the middle of the neck, and the third down to the shoulder, and there little beneath that place on the contrary, arise two other black lines like circles ascending in the compasse of the shoulder to the back bone: and all the residue of the body is distinguished and parted into of the shoulder to the back bone: and all the residue of the body is distinguished and parted into of the shoulder to the back bone: and sall the residue aftered abruptly throughout the whole circuit, many colours, having diversand sindry black spots scattered abruptly throughout the whole circuit, many colours, having diversand sindry black spots feathers. For that which is upon the back is continued whereof some are continued and joyned together. For that which is upon the back is continued whereof some are continued and third arising in that part, are broken and divided, the from the shoulder, and the second and third arising in that part, are broken and divided, the sall the residue are in like fort discontinued and separated one from the other so from the shoulder, and the recond and the sort discontinued and separated one from the other, so that fourth and all the residue are in like fort discontinued and separated one from the other, so that

their position runneth all in length.

The first part of his tail to the middle is spotted, and all the residue black. The hair bothon The first part of his tail to the middle is spotted, and as the residue black. The hair both of the face, legs, and feet, is fost, and very gentle to be handled, falling down, but in all other part of the body, it is harsh, deep, and standing upright: the spots doth both ascend and defend, the the body, it is harsh, deep, and standing upright: the tail was the passage for the excrement tongue hereof was smooth and not rugged, and under the tail was the receptacle or bag containing after the fashion in other beasts, and a little beneath the same was the receptacle or bag containing after the fashion in other beasts, and a little beneath the same was the receptacle or bag containing after the lamon in other beatts, and a little frace after that the privy part of the male which was hid or sheathed in the body. The beaft being moved to anger, uttereth a voyce like to the voyce of an angry Cat, withall doubling the letter R R. but being not angry the voyce is like a young Cats although lower.

doubling the letter I. A. Due being not angry the voyee is like a young cats although lower.

This Zibeth was in length from the head to the tail, one foot, three palms, and one Roman finger breadth, but the breadth thereof under the belly, was one foot, two palms, and three Roman finbreadth, but the breadth thereor under the beny, was one root, two paims, and three Raman fingers. It was a gentle and tractable Creature, and was fold for eight pounds of English money, which was in French twenty four Crowns, or in Florens forty and eight. These things are said by which was in French twenty four Crowns, or in Florens forty and eight. These things are said by which was in French twenty four Crowns, or in Florens forty and eight. Now unto this Gesner addeth, that he received such another Picture from one Johnnes Doctor Cay. Doctor Cay. Now unto this Gejner addeth, that he received such another Picture from one Johnson Kentmannus, which he took by another of these Cats in the possession of the Duke of Sayan, and the said that it was bought by him for seventy Taters (every Tater being worth in our English money eight pence half penny) in the year of the Lord, 1545. This beast is a very clean beast, I mean, a eight pence half penny) in the year of the Lord, 1545. This beast is a very clean beast, I mean, a half of the control of filthinesses and therefore the place wherein it lyeth must be sweet every day, and the hater of nithinesie: and therefore the place wherein it syeth must be swept every day, and the Vessels clean washed. The Sivet or liquor distilled out of the Cod, must be taken away every second or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or third day, or else the beast doth rub it forth of his own accord upon some poste in his kentond or the last day and the last day according to the last day accord nel, if he be tamed or inclosed. This Sivet is an Excrement not growing in the secret part only, but in a peculiar receptacle by it self, increasing every day the weight of a groat; the colour where of at the beginning is like Butter, but afterwards it groweth more fad and brown: one ounce of it if it be pure and not sophisticated, is fold for eight Crowns at the least. There be Impostors, it if it be pure and not sophisticated, is fold for eight Crowns at the least. It it it be pure and not iopnimicated, is iold for eight Crowns at the leak. I here be impossor, which do adulterate it with an Oxes gall, Styrax, and Hony. This is of a strange savour, and preferred before Musk by many degrees, yet it smelleth worse if it be held hard to the nose: Itishid that the liquor running out, doth go back again if any Vessel be put to receive it, except the a Silver Spoon or Porringer.

Les Afer faith, these Beafts are wilde, untamable, and live upon flesh, but the European Merchants buy of the young ones and nourish them tame, with Bran, Milk, hard Egges, and other things, and that fo they convey them into Europe out of Africk, emptying their Cods twice or thrice a daying the hot Country at and that this Sivet is nothing else but the sweat of the beast under the rise legs, neck, and tail. There were divers of these Zibeths tamed among other. It is reported to the control of the of a Conful of the Florentine Merchants at Alexandria, that had one of these for tame, that it would not be self, thereaplay with a man, and bitch is nose; ears, cheeks, or live so gently that it should not be self, thereason whereof was given, because it was at the first nourished with the milk of a Woman. Cardinal Galestim had three of these at Rome, which he kept for their Sivet : And Otho Duke of Bearis, had also one which he nourished with Sugar. They are bred in Ethiopia and India, about the City Pegus and Tarnafari. Their Sivet is not favoury till it be wished and cleanfed. It is faid to be very excellent against the strangulations of the wombe; and it is good against the Colick; It hash allo vertue to purge the wombes of women, to purge the brain, and is applyed to many other disast and infirmities. and infirmities.

The end of the History of Four-footed Beasts.

HISTORY SERPENTS:

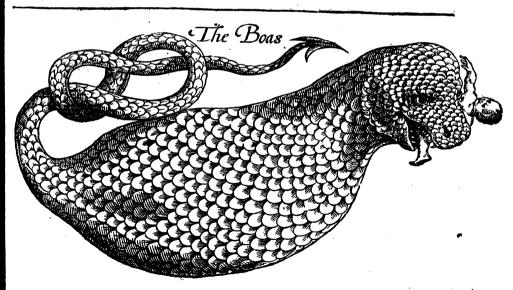

Thesecond Book of living Creatures:

WHEREIN IS CONTAINED

Their Divine, Natural, and Moral descriptions, with their lively Figures, Names, Conditions, Kindes, and Natures of all venomous BEASTS: with their several Poysons and Antidotes; their deep hatred to Mankinde, and the wonderful work of God in their Creation, and Destruction.

Necessary and profitable to all sorts of Men: Collected out of divine Scriptures, Fathers, Philosophers, Physicians, and Poets: amplified with sundry accidental Histories, Hierogliphycks, Epigrams, Emblems, and Ænigmatical Observations.

Entle and pious Reader, although it be needlesse for me to write any more of the publishing of this Treatise of Venemous Beasts, yet for your better satisfaction and direction, briefly take this which followeth.

After the publishing of the former book of Four-footed Beafts, I understood of two things much misliked therein, wherein I also my self received a just offence.

First, the manifold escapes in the Presse, which turned and sometimes overturned the sense in many places, (especially in the Latine) which fault as it is in this Edition amended. may in part concern me, so yet it toucheth another more deeply, yet are both of us excusable: He in wanting the true knowledge of the Latine Tongue; and I, because of my employment in my Pastorall charge, and both of us together, because we were not so throughly estated, as to maintain a sufficient Scholar to attend only upon the Presse. Wherefore, in this second Book, we have removed away that blot, and used a more accurate diligence, and I trust there is no escape committed perverting the sense, and not very many altering the letters.

The second exception taken against the former Treatise, was the not Englishing or translating of the Latine Verses, which thing I purposed to have done, if I had not been overhaltened in the businesse; for it had been to the work an Ornament, and to the History a more ample declaration: This fault I have now amended in the setting forth of this second Book of Living Creatures. All therefore that can be said for your direction, I could wish the History more compleat for the manifestation of the most blessed Trinities glory, whose works are here declared; and for the better revelation of the severall natures of every Serpent. I may fail in the expressing of some particular, yet I suppose that I have omitted no one thing in their narration, which might be warranted by good authority or experience. And therefore, although I cannot say that I have said all that can be written of theseliving Creatures, yet I dare say I have wrote more then ever was before me written in any Language.

Eee

To the Reader.

Now therefore ask the Creatures (after God) and they will tell you: For. saith S. Austin, Interrogatio creaturarum profunda est consideratio ipsarum: responsio earum, attestatio ipsarum de Deo, quoniam omnia clamant, Deus nos secit. The asking of the Creatures is a deep and profound confideration of their l ne asking of the Clearing of their artellation or testimony of God, beseverall natures: their answer is their attellation or testimony of God, because all of them cry out, The Lord hath made us. Wherefore, seeing it is most true, incognita non desiderantur, things unknown are not desired, to the intent that all true English Christians may hereafter more affectionately long after and desire, both the mysticall vision of God in this World, and also his perfect fight in the World to come, I have (for my part) out of that weak ability wherewith I am endued, made known unto them in their own mother Tongue, the wonderfull works of God; for the admiring of Gods praise in the Creatures, standeth not in a confused ignorance, not knowing the beginnings and reason of every thing, but rather in a curious and artificiall investigation of their greatest secrets.

Therefore, let all living men consider every part of divine wisdome in all his works; for if it be high, he thereby terrifieth the proud; by the truth he feedeth the great ones; by his affability he nourisheth the little ones. And so I will conclude my Preface with the words of the three Children: Dall ye works of the Lord, praise him and magnifie him for ever.

Edward Topsell.

AGENERAL TREATISE

SERPENTS,

DIVINE, MORAL, and NATURAL.

Of the Creation and first Beginning of SERPENTS.

Here is no Man that can justly take exception that this History of Serpents beginneth at their Creation: for seeing our purpose is, to set forth the works of GOD, by which as by a clear glass, he endevoureth to disperse and distri-GOD, by which as by a clear glats, he endevoureth to disperse and distribute the knowledge of his Majesty, Omnipotency, Wisdom and Goodness, to the whole race of Mankinde, it seemeth most proper that the first stone of this building, laid in the soundation be setched from the Creation: and the rather, because some Naturalists (especially amongst the antient Heathen) have taken the Original of these venomous Beasts, to be of the earth, without all research of Divine and Brimany Creation. And hereupte some Heartiche are

all respect of Divine and Primary Creation. And hercunto some Hereticks, as Augustine. the Manichees, and Marcianites, have also subscribed, though not directly, for they account the CreEpiphan.
suon of these venomous and all hurtful Beasts an unworthy work for the good GOD, because they could never fee any good use of such creatures in the World.

tould never lee any good use or justificreatures in the vvorid.

Yet we know the blessed Trinity created the whole frame of this visible World by it self, and for Zanchius.

Sood, reasonable, and necessary causes, framed both the beneficial and hurtful Creatures, either for a Physical or Metaphysical end. Therefore it is most certain, that if we consider the outward for a phylical or Metaphylical end. I herefore it is most certain, that if we consider the outward parts of these Creatures endued with life, no man nor nature could begin and make them, but the first Essence or Fountain of life; and if we can be brought to acknowledge a difference betwixt our shallow capacity, and the deep wisdom of God, it may necessarily sollow by an unavoidable sequel, that their uses and ends were good, although in the barrenness of our understanding, we reques, that their uses and ends were good, although in the barrenness of our understanding; we cannot conceive or learn them. But I purpose not to follow these things Philosophically by arguments, but rather Divinely by evident demonstration of the things themselves. And first of all, it appeareth, Gen. 1.24. that God brought out of the earth all creeping things after their binds: And less that any man should doubt, that under the general name of creeping things, Serpents, and other venomous Beasts, were not intelligibly enough expressed, it is added Chap. 3.1. That the Serpent was more subtliether all the Beasts of the field which God bad made. The Propher David also, Pall 148. 7. among other things which are appeared by the Propher to pressed the series of th Pal. 148. 7. among other things which are exhorted by the Prophet to praise their Creator, there are named Dragons, which are the greatest kinde of Serpents. Unto this also alluded S. James, the chi.3.7. saying. That the whole nature of Beasts, and of Birds, of orcepting things and things in the Sea in tamed be the nature of Man, which is next unto God, hath authority and power, to rule over all his

works, and therefore over Serpents.

And herein it is fit to shew, what wonders men have wrought upon Serpents, taming and de-Textor. frozing them rather like Worms and Beafts, no ways enemies to mankinde, but friendly, and endued with sociable respect, or esse as weaklings commanded by a superior power. Such an one was Any anotable Inchanter, who by touching any Serpent brought it into a deadly sleep: according to thefe verfes;

> Nec non Serpentes diro exarmare veneno, Doctus Atyr : talluque graves sepire chelydres. In English thus;

The cunning Atyr, Serpents fierce, of poylon did difarm, And Water-snakes to deadly sleep, by touching be did charm.

Alvifim

Alvisius Gadamustus, in his description of the new World, telleth an excellent history of a Live rian young man, being among the Negroes travelling in Africk, whereby he endevoureth to prove, rian young man, being among to them, to take and charm Serpents, according to the verse of the

Of Serpents in General.

Frigidus in praiis cantando rumpitur anguis. That is. The cold-earth-spake in Medows green, By finging, broke in rieces may be feen.

The young man being in Africk among the Algrees, and lodged in the house of a Nephew to the The young man being in spirit to his reft, fuddenly awaked by the hearing the un-Prince of Budontel, when he was taking ministrated to make the worked noise of the hiffing of innumerable forts of Serpents; whereast while he workled, and bewonted note or the mining of influence and located to suppose the work of the work of the ing in some terror, he heard his Hoff (the Princes Nephew) to make himself ready to go out of the doores, (for he had called up his servants to saddle his Camels:) the young man demanded of him doores, (for he had called up his servants are well lates in the dark night? to whom the work of the work doores, (for ne had spined ap out of doores now so late in the dark night? to whom he answered, I the cause, why ne would go out of accords now to late in the above ingit to whom he answered, I am to go a little way, but I will return again very speedily: and so he went, and with a charm quieted the Serpents, and drove them all away, returning again with greater speed then the Lightler young man his guess expected. And when he had returned, he asked his guess if he did not hear the later to his guess if he did not hear the later to his guess in a supplied that he had heard them to his guess. young man me for the Serpents ? and he answered, that he had heard them to his great terrour: immoderate mining of the oct pents and dishoror) replyed, saying; they were Serpents which had Then the Princes Nephew (who was called Bishoror) replyed, saying; they were Serpents which had beset the house, and would have destroyed all their Cattel and Herds, except he had gone forth to drive them away by a charm, which was very common and ordinary in those parts, wherein were abundance of very hurtful Serpents.

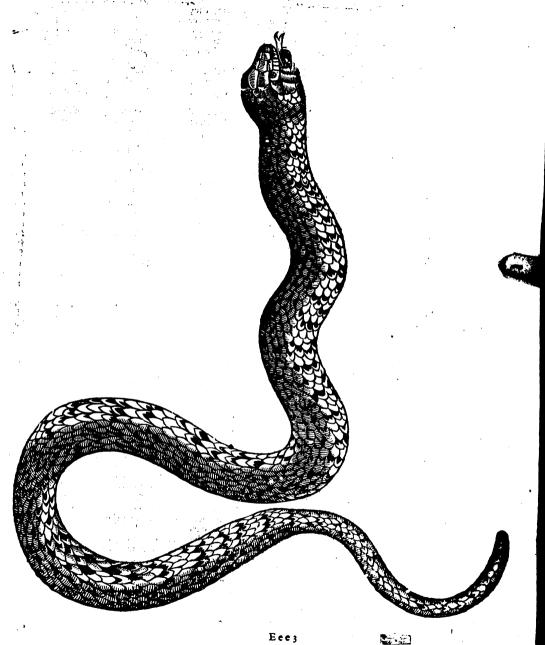

The Ligurian young man hearing him say so, marvailed above measure, and said, that this thing was fo rare and miraculous, that scarfely Christians would believe it. The Negro thoughtitas frange that the young man should be ignorant hereof, and therefore told him, that their Prince could work more strange things by a charm which he had, and that this and such like were small vulgar, and not to be accounted miraculous. For when he is to use any strong poylon upon present necessity, to put any man to death, he putteth some venom upon a sword, or other piece of Armor and then making a large round circle, by his charm compelleth many Serpents to come within that circle, he himself standing amongst them, and observing the most venomous of them all sastem. bled, which he thinketh to contain the strongest poyfon, killeth him, and causeth the residue tode. part away presently; then out the dead Serpent he taketh away the poyson, and mixeth it with the feed of a certain vulgar tree, and therewithal anointeth his dart, arrow, or fwords point, whereby is caused present death, if it give the body of a man but a very small wound, even to the breaking of the skin, or drawing of the bloud. And the faid Negro did earnestly perswade the young man to fee an experiment hereof, promifing to shew all as he had related, but the Ligurian being more willing to hear fuch things told, then bold to attempt the trial, told him, that he was not willing to fee any fuch experiment. And by this it appeareth, that all the Negroes are addicted to Incantations, which never have any approbation from GOD, except against Serpents, which I cannot very easily be brought to believe.

And seeing I have entered into this passage of Charming, being (no doubt) an invention of Man, and therefore argueth his power to tame these venomous Beasts, according to the former laying of Saint James, although I condemn such courses utterly, yet it is lawful to prosecute the same, seeing the holy Ghoft, Pfalm 58. verf. 4,5. affirmeth a practife against Serpents, a dexterity and ripensin that practife, and yet an impossibility to affect any good, except the voyce of the Charmer come to the ear of the Adder: For thus he writeth ; Their poyfon is like the poyfon of a Serpent, like a desf Aida that Roppelb bis ear. 5. Which heareth not with the voyce of the Inchanter, though be be most expert in cuming Upon which words Saint Augustine, Saint Ferom, and Cassidorus writing, say; that when the Chamer cometh to Inchant or Charm, then they lay one of their ears to the earth lo close, asit may not receive the found, and their other ear they stop with their tail. I will therefore vet add somewhat more

of this taming of Serpent.

I have heard a Gentleman of fingular learning, and once my worshipful good friend, and dayly encourager unto all good labours, report divers times very credibly, upon his own knowledge and eye-fight, that being at Padua in Italy, he faw a certain Quack-falver, or Mountebanck upon a flage, pull a Viper out of a box, and suffered the said Viper to bite his flesh, to the great admiration of all the beholders, receiving thereby no danger at all. Afterward he put off his doublet and thirt, and thewed upon his right arm a very great unwonted blew vein, standing beyond the common course of nature; and he said, that he was of the linage of Saint Paul, and so were all other that had such veins, and that therefore (by special vertue to that Family given from above) no Viper nor Strptn could ever annoy or poylon them: but withall, the fellow drank a certain compound water, or an idea of the could ever annoy or poylon them: tidote, for fear of the worft, and fo at one time vented both his superstitious hypocrific, and also much of his Antidote to his great advantage.

But I have fince that time also read, in Matthiolus his Commentaries upon the fixth Book of Disserides, that there were wont to be many such Juglers in Italy, carrying in their bosomes link Serpents, of whose fraudulent Impostures he speaketh in this fort. They take Serpents in the

Mr. Will. Morley of Glynde in Suffex.

Winter time, when they grow dead and stiffe through cold, & yet for their better defence against their venomous biting, they defend themselves by a certain experimental unguent, known to be practifed in this sport, made of the Oyl pressed out of wilde Radish, the roots of Dragonwort, the juyce of Dassonit, the brain of a Hare, the leaves of Sabine, sprigs of Bay, and some other sew things of Dassonit, the brain of a Hare, the leaves of Sabine, sprigs of Bay, and some other sew things of the reason of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and by reason of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and the reason of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and the reason of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and the secret when a steerward they make oftentation, hereof in the Market, or publique Stage, they suffer them the manner of the stage of the stage, they suffer them to bite their own sech substitution of the second substitution of the second substitution of the second substitution of substitution of the second substitution of substitutions. And by this deceive the world where ever they come, giving sorth that of filled again: And by this deceive the world where ever they come, giving sorth that they are of the linage of Saint Paul, who cast a Viper off from his hands, as we read in the holy Scritter of the substitution of the substitution of the linage of Saint Paul, who cast a Viper off from his hands, as we read in the holy Scritter of the substitution of the substitution of the linage of Saint Paul, who cast a Viper off from his hands, as we read in the holy Scritter of the substitution of the su

ture. It was an invention of ancient time armong the wife Magitians, to make a pipe of the skins of Cats legs, and therewithall to drive away Serpents; by which it appeareth, that the foveraignty of Man over Serpents, was given by GOD at the beginning, and was not loft, but continued after the fall over serpents, was given by that thould rule be much weaker) and practifed by the most barbarous of man, (although the hand that should rule be much weaker) and practifed by the most barbarous or man, (anthough the hand the defence forcing a violence and hatred, betwixt the Serpent and the or the world, necessity of the seal of the seaven daughters of Ailas, whereof one was called Hys, whose daily exercise was hunting of venomous Beasts, and from her the Hysdes had herdenomination. And for a conclusion of this Argument I will adde this one flory more out of Minne. when Thoms the King of Egypt had received of Menelaus, Helen to be fafely kept, while he travelled through Ethiopia it happed that the King fell in love with her beauty, & oftentimes enderons. ed by violence to ravift her; then, it is also said, that Helen, to turn away the Kings unlawful lust, opered all the matter to Pondamna the wife of Thonis, who instantly fearing her own estate, lest that in time to come, fair Hohn thould deprive her of her husbands love, banished her into the Island of time to come, fail come finding all manner of Serpents, and yet taking pity on her for her simplicity, gave her a certain herb, whereby she drove away all Serpents. For (it is said) when the Serpents and venomous Beafts do but smell the same herb, they instantly hide their heads in the enth. Helen coming into that Island planted the same there, and was therefore called by the Inhibitants after her own name Helenium, which the skilful Herborifts at this day affirm to grow in

Unto this discourse of the taming of Serpents, I may add yet more strange things, if any thing thrange in the nature of this world. And those are some Histories of the samiliarity of Men, Women and Serpents. Alexander was thought to be begotten of a Serpent, for it is said, that on a time there was sound a great Serpent upon his Mother Olympia as she was sleeping; and some six (for the honour both of the Mother and the Son) that this Serpent was Jupiter, turned into the likeness of a Serpent, as we read he changed himself into many other shapes. And the like story unto this, is alledged of Scipio Africanus his mother, who long time remained barren without the fruit of the womb, insomuch as P. Scipio her husband utterly despaired of posterity. It hapsed one day, as she was in her bed, her husband being absent, there came a great Snake and lay beside her, even in the presence of the servants and family, who being mightily assonished thereas, cred out with loud voyces for sear, whereat the woman awaked, and the Snake slid away invisibly. P. Scipio hearing this report at his return home, went to the Wizards to understand the secret or signification of this prodigie: who making a sacrifice, gave answer that it betokened prolification, or birth of children, and thereupon sollowed the birth of Scipio Africanus.

We read also in Plutareb of certain Serpents, lovers of young Virgins, who after they were taken and instanced, shewed all manner of lustiful, vitious, and amorous gestures of uncleanness and carnality; and by name, there was one that was in love with one Etolia a Virgin, who did accussom to come unto her in the night time, sliding gently all over her body never harming her, but since glad of such acquaintance, tarryed with her in that dalliance till the morning, and then would depart away of his own accord: the which thing being made manifest unto the Guardians and Tuors of the Virgin, they removed her unto another Town. The Serpent missing his love, sought her up and down three or four days, and at last met her by chance, and then he faluted her not as he was wont, with sawning, and gentle sliding, but sierce assaulted her with grim and suster countenance, slying to her hands, and binding them with the spire of his body sast to her sides, did forty with his tail beat upon her backer parts. Whereby was collected, some token of his chassisement up to her, who had wronged such a Lover with her wissus and disappointment.

to her, who had wronged such a Lover with her wilful absence and disappointment.

It is also reported by Ælianus, that Egemon in his verses, written of one Alva a Thessalian, who seed ing his Oxen in Thessalian, near the Fountain Hamonius, there fell in love with him a Serpent of exceeding his oxen in Thessalian, and the same would come unto him, and softly lick his face and golden had been according to the same would come unto him, and softly lick his face and golden had been according to the same and manner of hurt at all

without doing him any manner of hurt at all.

These, and such like things do evidently prove, that Serpents are not only involuntarily tamed by
Men, but also willingly keep quarter with them, yeelding to the first Ordinance of the Creator, that
Men, but also willingly keep quarter with them, yeelding to the first Ordinance of the Creator, that
Men the first ordinance of the Creator, that the first ordinance of the Creator, the first ordinance o

Of the natural Generation of SERPENTS, and their several Originals.

It being thus cleared, that Serponts were at the beginning created by GOD, and are ruled by men, it now followeth, that we should in the next place talk of the matter of their beginning, and the means of their continuance ever since their Creation.

VI Serpents in General.

First therefore it is most plain in Genesis, that the Earth (by the vertue of the Word of GOD) did produce all Creeping things, and among them Serpents: but since that time, they have engendered both naturally, and also prodigiously.

As concerning their constitution, it is held to be most cold, above all other living Creatures; Pliny. and therefore Pliny writeth, that they have neither heat, nor bloud, nor sweat. Hereunto subscri- Galen, heth Galen and Rafis; yet Avicen feemeth to affirm the contrary. Mercurial decideth this controversie, and proveth that Serpents are extreamly cold, and their bodies outwardly moift. First, because those which are stung and poyloned by Serpents, are oppressed with an unnatural cold, which overcometh natural hear, and distendeth all their parts, vexing them intolerably. Secondly, there can be affigued no other reason why these Creatures hide themselves sour moneths in the year, but only their natural cold, making them fo tender, as they are altogether unfit to endure any external frigidity. Thirdly, if a man take a Snake or a Serpent into his handling in the midft of Summer, and warmest part of the year, yet shall he perceive that they are cold in a palpable manner being alive, which is not a quality competible to any other creature. Fourthly, seeing that bloud is the proper and native feat of all heat in natural living bodies, Serpents having a very small quantity of bloud, must also have a smaller proportion of heat : and therefore it followeth unavoidably, that the eminency of their temperament is cold in the highest degree, above all other living Creatures. And that their bodies be outwardly moift, it appeareth (faith Istairm) by this, that when they flide along upon the Earth, (which way foever they go) they leave behinde them in their train or path a flimy humour.

By this therefore it is confirmed, that they are of the Earth and of the Water, as afterward we shall shew in the description of their kindes. But yet there are prodigious beginnings of Serpents, Plutareb, whereof some seem to be true, and other to be fabulous. The first fort are those which Pliny affirm—Pierius, whereof some of the marrow in the back-bone of a man, and that indifferently, out of the Textor. dead bodies of good and evill men. Yet some more modest, thinking it unreasonable, that the remnants of a good meek man, should beget or be turned into so barbarous, venomous, and cruel a nature; rather taking it for granted, that peace and quietness is the reward of such persons, attribute these beginnings or alterations to the bodies of wicked men, as a just deserved punishment of their former evils, that the reversions of their should after death turn into Serpents, whom they resembled being alive in the venomous fraud of their spirits. Of this Ovid speaketh.

Sunt que cum clauso putresatta est Spina sepulchro, Munari credunt bumanas angue medulus. Which may be thus Englished,
Some think the putrid back bone in the grave rack'd,
Or marrow chang'd, the shape of Snakes to take.

In Egyp, as Frogs and Mice are engendred by showres of rain, so also are Serpents: And Avicen Macrobius. faith, that the longest hairs of women are easily turned into Serpents. Nivander dreameth, that all Calius Rho. Tybon. Apollonius Rhodius, of the bloud of the Titans or Giants. Acustlam, of the bloud of Pliny. dung being laid in a hollow place, subject to receive moisture, engendereth Serpents, Of the Gordina drops, Ovid writeth thus;

Cumque super Lybicas victor penderet arenas,
Gorgonei capitis gatta cecidere cruenta,
Quas humus exceptas, varios animavit in angues,
Unde frequens illa est insessanta colubris.
Which may thus be Englished:
— And as be over slew
The Lybick sands, the drops of bloud that from the head did sew
Of Gorgon being new out off, upon the ground did fall,
Which taking them, and as it were conceiving them withall,
Engendred sundry Snakes and Worms: by means whereof that Clime
Did swarm with Serpents ever sinca, to this same present time.

But most strange of all other, are the succeeding Narrations. For it is reported that when L. Scipio, and G. Norbanus were Consuls, that the Mother of Clusius in Hetruria, brought forth a living Serpent in stead of a childe, and the said Serpent by the command of the Wizards was cast into a River,
nevertheless it would not drown, but swimmed against the stream. And Pliny saith, that at the beguning of the Marlyck war, there was a maid-servant that brought forth another Serpent. And

Plutarch.

Ca. Oppins. Int. Higinus. Gellius.

Pieriw.

Pierius.

Fausting the Empress dreamed that the brought forth Serpents, when the was with childe of Commisdu and Antoninus, and one of these Serpents seemed more fierce then the other, which proved alleam and Antoniam, and one of the war of voluptuous and tyrannous, that he feemed like a Serpent to be born for nothing, but for the destruction of mankinde.

In the year of our Lord 1551. there was a little Latine Book printed at Vienna, wherein was conin the year or our Lord 1551. there was a fitte Book) about S. Margarites day, there hap tained this History following. In this Summer (faith the Book) about S. Margarites day, there hap pened most rare and admirable accidents: for near a Village called Zichfa, by the River Theofe in peneu mon rare and admin able access and Lifards bred in the bodies of men, very like to fuch as are bred in the earth, whereupon they fell into exquisite torments: and there dyed of that calamity, bred in the earth, whereupon they fell into exquisite torments: and there dyed of that calamity, about three thousand, and some of the bodies being laid against the Sun gaping, the Serpents came forth of their mouths, and suddenly entred into their bellies again. Amongst other, there was a certain Noblemans daughter which dyed of that malady, and when the was discreted or ripped, there were found in her body two great Serpents. These things seem to be miscreded or ripped, there were found in her body two great Serpents. These things seem to be miscreded on the was the order of Nature: yet credible, because in our experience in Emstand, there raculous, and above the order of Nature: yet credible, because in our experience in Emstand, there have been Worms like Serpents sound in the bodies of men, whereof some have been ejected the have been when as the parties were dead. But that these beginnings have been worms like serpents found in the parties were dead. But that these beginnings of Serparties being alive, and other when as the parties were dead. But that these beginnings of Serparties being alive, and other when as the parties were dead. parties being unnatural, are Divine and lent from God as scourges, it may appear by another notable pents peing unnatural, are Divine and Book, both in the same year, and in the same Countrey. History, recorded in the aforenamed Book, both in the same year, and in the same Countrey.

there was (faith mine Author) found in a mow or ryck of Corn, almost as many Snakes, Adders. and other Serpents, as there were theafs, fo as no one theaf could be removed, but there prefently and other serpents, as there were interest, to as no other men determined to fet fire upon the appeared a heap of ugly and fierce Serpents. The Countrey-men determined to fet fire upon the Barn, and so attempted to do, but in vain, for the straw would take no fire, although they labored with all their wit and policy to burn them up. At last, thereappeared unto them at the top of the heap with an their wit and poincy to burn their deplace with mans voice to the Countrey-men, faying: a huge great Serpent, which lifting up his head spake with mans voice to the Countrey-men, saying: Ceale to prosecute your devise, for you shall not be able to accomplish our burning, for we were not bred by Nature, neither came we hither of our own accord, but were fent by God to take vengeance on the fins of men. And thus much for the true and natural beginnings of Serpents.

Now we read in read in holy Scripture, that the rod of Moses was turned into a Serpent by divine miracle, whereby he was affured of the power that God would give him to deliver his people Ifial out of Egypt, which land abounding with Serpents, both natural bred in the earth, and moral, fuch are crafty and politick Princes and people: yet Mofes should take them as he did his Serpent by the tail, and cause them to bend unto him like as it were a wand, or else some other little walking staffe: and also that his power should be unresistible, because his Serpent devoured others. The Magitians or Sorcerers, (as Jannes and Jambres) relisted him, and also turned their rods into Serpents. But Milit did it by true piety, they by diabolical delusions, as false Christians many times work miracles by outward fignes of true piety, and therefore Mofes rod overcame the Sorcerers Serpents, because theend of fraud and falsehood is, to be overcome by truth and piety.

From this changing of rods into Serpents, came the several metamorphosing of fundry other things into Serpents also, as that tale of Orphens head, after he was torn in pieces by the Thracian women; and the same thrown into a River, was taken up in Lemnos. The Poet describeth it thus;

Hic ferm exposito peregrinu anguis arenis Os petit, & Sparfos Hillanti rore capilles Lambit, & hymniferos inbiat divellere vultus : In English thus;

Tandem Phabus adeft : morfafque inferre parantem Arcet, & in Lapidem rictus Serpentis apertos Congelat, & patulos ut erant indurat hiatus.

No fooner on the forain coast now cast a land they were, But that cruel natur'd Snake did straight upon them fly, And licking on bis ruffled hair, the which was dropping dry, Did gape to tyre upon those lips that had been wont to sing The beavenly hymnes. But Phabus straight preventing that same thing, Dispoints the Serpent of his buit, and turns bim into stone, With gaping chaps, o.c.

So Isacius Tertes writeth, that when Tiresia found Serpents in carnal copulation in Cilians, he flew a female, who presently after death was turned into a Woman, then also he slew a male, who likewise being dead, was in the same place and manner turned into a Man. When Cadmus was was sent by his Father, to feek out his fifter Europa that was ravished by Jupiter, with straight charge notto return back again except he could finde her, having spent much time in seeking her to no purpose, because he could not finde her, and not daring to go back again to his father; he was warned by the Oracle that he should go into Baotia to build a City. Coming thither, he sent his companiors to the fountain of Mars that was in the Countrey to fetch water, where a great Serpent came and killed them; at last, Cadmas not finding their return, went likewise to the same Fountain, wherehe he found all his men flain, and the Serpent approaching to affail him but he quickly killed it. After ward he was admonished by Palles, to strew the teeth of the same Serpent upon the ground, which he performed, and then out of those teeth (saith Ovid) arose a multitude of Armed men, who inflantly fell to fight one with the other, in such cruel and bloudy manner, that at the last there were but five of them all left alive, which five (by the will of Pallu) were preserved to be the Fathers Of Serpents in General.

of the people of Thebes. And so Apolionius faigneth, that with the help of men bred of Serpent, teeth, came Jason to obtain the Golden Fleece.

They faign also, that Achelons when he strove with Hercules about Deianira, turned himself into divers shapes, and last of all into a Serpent, or as some say, into a River. So likewise Galmus aforefaid, being overcome with the fight and fense of his own miseries, and the great calamities that hefell to his Daughters and Nephews, forfook Thebes, and came into Illyrium, where it is faid, that he earnefly defired of the Gods to be turned into a Serpent, because a Serpent was the first original of all his extremities. Anipater faigneth Jupiter to be turned into a Serpent; and Meduja refuling the love of Neptune, is also faigned by Ovid to be turned into a Serpent, when he writeth;

Hanc pelact rector templo vitiaffe Minerva Dicitur . aver a eft & caftos Ægide vultus Nota Tovis texit : neve boc impune fuiffet,

Gorgoneum crinem turpes mutavit in Hydros. Nunc quoque ut attonites formidine terreat boftes, Petiore in adverso, quos fecit suffinet angues.

In English thus: It is reported bow fhe should abus'd by Neptune be, In Pallas Church, from which foul fact Joves daughter turn'd her eye:

And lest it should unpunish be, she turnd her seemly hair To loathsome Snakes, the which the more to put ber foes in fear, Before her breast continually she in her hand doth bear.

Fierius writeth, that the myrtlerod was not lawful to be brought into the Temple of Hecate, and that a Vine branch was extended over the head of her fign: and whereas it was not lawful to name Wine, they brought it into her Temple under the name of milk, and that therein continually lived harmlels Serpents. The reason of all this was, because that her own Father Faunus sell in love withher, whom the resisted with all modesty, although the were beaten with a Myrtlerod, and made to drink Wine; but at last the beastly father was transformed into a Serpent, and then he oppressing her with the spires of his winding body, ravished her against her minde. These and such like stories and Fables are extant about the beginnings of Serpents; all which, the Reader may confider, to flir up his minde to the earnest and ardent meditation of that power that of stones can make men,

of Rocks, water; of water, Wine; and of small Rods great Serpents.

Then thus having expressed the Original of Serpents in their Creation, it followeth now to add Pliny. the residue of this Chapter about their generation. It is a general rule that all Beasts wanting feet Aristotle. and have long bodies, perform their work of carnal copulation by a mutual embracing one of the other, as Lampreys and Serpents : And it is certain, that two Serpents in this action feem to be one body and two heads, for they are so indivisibly united and conjoyned together, and the frame of their body is altogether unapt for any other manner of copulation. When they are in this acti- Elianus. on they fend forth a rank favour offenfive to the fense of them that do perceive it: And although like unto many fishes, they want stones, yet have they two open passages wherein lyeth their generative seed, and which being filled provoketh them to their venereal lust, the seed it self being like a miky humor; and when the female is under the male, the hath also her passages to receive the feed, sit were into the cells of her womb, and there it is framed into an Egge, which she hiderh in the earthan hundred in a cluster, about the quantity of a Birds egg, or a great bead, such as are used some-

Andthis is general for all Serpents, except Vipers, who lay no Egges, but hatch in their wombs their young ones, as we shall shew at large in their particular history. The Serpent having laid her Egge sitteth upon them to hatch them at several times, and in a year they are persected into young ones. But concerning the supposed copulation of Serpents and Lampreys, I will not meddle in this place, referving that discourse to the History of Fishes, and now only it sufficeth in this place to nameit, as a feigned invention; although Saint Ambrofe and other ancient Writers have believed the same, yet Aibenam, and of late days P. Jovim, have learnedly and sufficiently declared by unanswerable arguments the clean contrary. The Serpents love their Egges most tenderly, and do every one of them know their own, even among the confused heaps of the multitude, and no less is their love to their young ones, whom for their safeguard, sometime they receive into their mouths, and suffer them to run into their bellies : And thus much for the generation of Ser-

Of the Names of Serpents, and their several parts of Anatomy.

 $\mathbf{R}^{ ext{Y}}$ Serpents we understand in this discourse all venomous Beasts, whether creeping without legs, Das Adders and Snakes, or with legs, as Crocodiles and Lizards, or more neerly compacted bodies, as Toads, Spiders, and Bees, following herein the warant of the best ancient Latinists, as namely Corneliu Celliu, Pliny and spuleiu do call Lice Serpents, in that their relation of the death of Phere-Ode the Syrian, who was the Præceptor of Pythagoras, of whom it is faid. Seppentibus periffe, to have perished by Serpents, when on the contrary it is manifested he was killed by Lice. Aristicale and Galen define a Serpent to be animal sanguineum pedibus orbaium & oviparum, that is a bloudy Beast without feet,) it laying egges; and fo properly is a Serpent to be understood.

The Hebrews call a Serpent Nachalch. Darcon and Cheveia by the Chaldees: fo also Thaninha and The Hebrews can a serpent Avacage.

Schephiphon, by the Hebrews; as Rabbi Solomon, Munster and Pagnine write. The Grecians, Othidi and Schephiphon, by the receive; as Acade Viper in particular, even as the Latine, Sepons, or Sepula Ophia, although this word do also fignifie a Viper in particular, even as the Latine, Sepons, or Sepula Ophis, although this word do and right an Adder. The Arabians, Hale, and Haddie, for all manner of do, sometime a Snake, and sometime an Australian for Serpents of the Wood, likewise Apartia and Auss.

Serpents. And Testub, or Tenstu, or Agestim for Serpents of the Wood, likewise Apartia and Auss. Serpents. And Legius, or Lengus, or August and Aug.
The Germans, Ein Johlang; which word feemeth to be derived from Angus, by an usual figure, and af. The Germans, Ein joniang; winch word recine to be call it Un ferpent; the Italians, Serpe & Serpente; ter the German fashion, preposing Sch. The French call it Un ferpent; the Italians, Serpe & Serpente; ter the German tathion, prepoining oco. The remodel in two desires of all manner of Serpente; and Massarius saith, that Scorze and Scorzone, are general words for all manner of Serpents in Italy, which strike with their teeth. The Spaniards call them Sierpe; the Grecians call the young ones in the which itrike with their teeth. The Opanian and the Latines, Catali. And thus much for the names in general, which in holy Dams belly, Embrua; and the Latines, Catali. Scripture is Englished a Creeping thing.

Now it followeth, that I should fet down a particular description of all the outward parts of Ser-Now it ionowers, that a modulate for the most part like the place of their habitation, or abode, pents; and first of all, their colour is for the most part like the place of their habitation, or abode, pents; and nrivor and therein they live; and therefore I have feen fome black, living in dung; I mean like the Earth, wherein they live; and fome of other colour, as green living in treas I mean like the Earth, whiteh the following in fandy rocks; and fome of other colour, as green, living in trees and fields, fome yellow, living in fandy rocks; and former balls. Like the feeler of fifth, which are not fields, tome yenow, average in landy locas; and felds, like the scales of fish, which are both white, but generally they have spots on their sides and belly, like the scales of fish, which are both white,

black, green, yellow, brown, and of other colours also, of which Ovid writeth:

___Longo caput extulit antro Caruleus Serpens, horrendaque sibila misit.

That is, The greenish Serpent extold ber bead from den so steep, And fearful hiffing did fend forth frem throat fo deep.

The frame of their bodies do not much vary in any, except in the feet and length, fo that with a reservation of them, we may express their universal Anatomy in one view; for almost all of them are of the same proportion that is seen in Lizards, if the seet be excepted, and they made to have longer bodies. For they are inclosed in a kinde of shell or crusty skin, having their upper parson ther back, and their neather parts on the belly like a Lizard, but they want stones, and have such manner of places for copulation as fiftes have, their place of conception being long and cloven All their bowels, by reason of the length and narrowness of their bodies, are also long and narrow, and hard to be diferred, because of the distimilitude of their figures and shapes. Their artery is long, and their throat longer then that : the ground or root of the artery is near the mouth, for a man would judge it to be under the tongue, fo as it feemeth to hang out above the tongue, specially when the tongue is contracted and drawn backward. The head long like a Fifhes, and flat; never much bigger then the body, except in monstrous and great shaped Serpents, as the Bost. Yea, Ariftotle maketh mention of a Serpent that had two heads; and Arnoldus, of a Serpent in the Pireney Mountains, flain by a fouldier, that had three heads, in whose belly were found two fons of the faid fouldier devoured by him, and the back-bone thereof was as great as a mans skull, or a Rams head. And such an one we read in our English story was found in England, in the year 1349. And the 23 year of Edward the third, there was a Serpent found in Oxfordfbire, near Chippingnorion , that had two heads and faces like women , one being shaped after the new attire of that time, and another after the manner of the old attire, and it had great wings, after the man-

The tongue of a Serpent is peculiar, for befides the length and narrowness thereof, it is also cloven at the tip, being divided as it were with very little or small nails points. It is also thin, lorg, and black of colour, voluble; neither is there any beaft that moveth the tongue fo fpeedily where fore some have thought, that a Serpent hath three tongues, but in vain, as Islaorus theweth, for they deceive by the nimbleness thereof. Their ventricle is large, like their maw, and like unto a Dog, also thin, and uniform at the end. The heart is very small, and cleaveth to the end of their artery. but yet it is long, and sheweth like the reins of a Man : wherefore sometimes it may be seen to be the tip or lap thereof to the breaft-ward. After this followeth the lights, but far separate from 6, being simple, full of fibres, and open holes like pipes, and very long: The liver long and simple; the mile small and round as in Lizards. The gall is for the most part as in fishes, but in Water-snakes it is joyned to the Liver . in other Serpents to the stomach or maw. All their teeth stand out of their mouth, and they have thirty ribs, even as there were among the Hebrews and Egyptians thirty days

Arifforle faith, that as their eyes be small, so also they have the same good hap that befalleth young Swallows, for if by chance they feratch or rend out their eyes, then it is faid they have other grow up naturally in their places; In like manner their tails being cut off, grow again. And generally Serpents have their heart in the throat, the gall in the belly or stomach, and their stones near ther tail: Their egges are long and foft, and in their teeth they cary poyfon of defence and and annoy. ance, for which cause they desire above all other things to save their heads. Their fight is but doll and dim, and they can hardly look at one fide, or backward, because their eyes are placed in that temples, and not in their fore-head, and therefore they hear better then they fee. They have eye-lids, for generally no creatures have eye-lids, except those which have hair in the other parts of their hadies forms. parts of their bodies; four-footed beafts in the upper cheek, fowls in the neather, or Lizards which

have egs, or Serpents which have foft backs. They have also certain passages of breathing in their have egs, or surprise are not fo plain that they can be termed nostrils, but yet they are not fo plain that they can be termed nostrils, but breathing places. Their nostrils, but yet they are not for plain that they can be the plain that notifies, parts of their ears are like to finny Fishes, namely small passages, or hollow places in the backer parts of their head, by which they hear.

ead, by which are like Sawes, or the teeth of Combes joyned one within the other, that fo they might not be worn out by grinding or grating together; and yet they bend inward, to the end that might not be better hold their meat in their mouths, being without all other externall help for they may ofe; for even those Serpents which have feet, yet can they not apply them to their chaps. In the upper chap they have two longer then all the refidue, on either fide one, bored thorough in the appropriate hole like the sting of a Scorpion, by which they utter their poyson. Yet there be fome good Authors that affirm, that this poyfon is nothing elfe but their gall, which is forced to the mouth by certain veins under the ridge or back-bone. Some again fay, that they have but one long tooth, and that a crooked one, which turneth upward by often biting, which sometime fallthoff, and then groweth again, of which kinde those are, which men carry up and down tame in

Although they be great raveners, yet is their throat but long and narrow, for help whereof when they have gotten a booty, they erect themselves upon their tails, and swallow down their meat the more easily. They cannot be said properly to have any neck, yet something they have, which in proportion answereth that part. They have tails like all other creatures, except Men and Apes, and some say that their poyson is contained in their tails, and is from thence conveved into fittle bladders in their mouths, therefore the Mountebanks or Juglers, break that bladder, that they may keep them without poylon, but within the space of twenty four hours they are recollected. and grow anew again.

Their bodies are covered over with a certain skin like a thin bark, and upon Serpents it fupplyeth the place that scales and hair do upon Beafts and fishes; for indeed, it is a pure skin, and in most things they are like to Fishes, except that they have lights, and Fishes have none: the reason is, they live on the earth, and the Fishes in the sea, and therefore have fins and gills instead thereof. The little Serpents have all their bones like thorns, but the greater, which stand in need of greater strength, have folid bones for their firmitude and better constitution. It is questionable whether they have any milt or no, and some say they have at the time of their laying of egges, and not otherwise. Their place of conception or secret, is large, and standeth far out, beginning beneath, and so arising up to the back-bone double; that is, having one skin or enclosure on either fide, with a double passage, wherein the egs are engendered, which are not laid one by one, but by heaps or clusters together. They have no bladder to contain urine, like to all other Creatures which have feathers, scales or rinde-speckled skins, except the Tortoises: the reason is, because of the exiguity and smallnesse of the assumed humour, and also all the humour acquired, is consumediato a loofe and evaporate flesh. And to conclude this Anatomy, I will adde a short description which Gregorius Macer a Physician wrote to Gesner, 1558. by this own diffection as followeth,

As I lay at rest in a green field, there came unto me a great Serpent hissing, and holding up her neck, which I suddainly with a piece of wood amazed at a stroak, and so slew without peril to my felf. Afterward, sticking her fast to a pale, I drew off her skin, which was very fast and sharp, and I found betwixt the skin and the flesh, a certain little, thin skin, descending all upon the body with the outward skin, and this was fomewhat fat. And when I came unto the place of excrements I found it like a Fishes, but there issued forth certain filth, farre exceeding in stinking savour the excrements of a man. After I had thus pulled off the skin, it was easie for me to look into the inward parts, which I found to answer the inward Anatomy of fishes and Fowls in some parts, and in other things, there appeared a proper disposition to the Serpent it self. For the Artery Traches was about three or four fingers long, turned about with little round circles, and fo descended to the lights, unto which the heart and the bladder containing the gall, did adhere or cleave fast. Then the liver was long, like the Fish Lucius, and so a white caul or fatnesse covered both the liver and flomach, which was half a span long: The guts began at the chaps, and so descended down to the place of excrements, as we see they do in Fishes.

Beneath the liver were the guts, upon either fide descended a certain nervy or hard vein, unto which the egs did cleave: which were covered with fuch little skins as Hens egs are before they belayd, but yet they were distinguished in seat or place, because of their multitude; for upon either fide I found two and thirty egs. The tongue of the Serpent was cloven, and very sharp, but there appeared not any poyson therein. And soit is evident, that in the vein Trachea, heart and lights, it agreeth with Birds; in the liver, guts and caul, it resembleth a Fish, but in the place of the gall, and disposition of the egs, it differeth from both. And thus farre Macer, with whose words will conclude this Chapter of Serpents Anatomy.

of the quantity of Serpents, and their abode, food, and other accidents.

great is the quantity of Serpents, and their long during age increaseth them to so great a state of the forms lost some sufficience and environments. So great is the quantity or Serpents, and their sold from fulpicious and envious minded persons, ture, that I am almost afraid to relate the same, left some suspension only the plantist. O ture, that I am aimot afraid to teleate the same of the plentiful testimonies should utterly condemn it for fabulous; but yet when I consider not only the plentiful testimonies inould utterly concerning for labulous; and also the evidence of all ages, (not excepting this where, of worthy and undounted Antiquaries, and and the worthy and Serpents, and Serpents skins, I re. in we live) wherein are and have been shewed publiquely many Serpents, and Serpents skins, I re. in we live) wherein are and have been thewea publiques, and affured answer for all future Obceive warrant sufficient to express what they have observed, and affured answer for all future Obceive warrant sufficient to express what they have observed. A size wherefore are the sufficient to express what they have observed A size wherefore are the sufficient to express what they have observed. ceive warrant jumcient to express what they have their kindes be many factions, of ignorant, incredulous, and unexperienced Asses. Wherefore as the life of Serpents is long, to is the time of their growth; and as their kindes be many, (as we shall manipents is long, 10 is the time of their grown, forme grow much greater and biggerthen fest in the succeeding discourse) so in their multitude, some grow much greater and biggerthen

ther.

Gellius writeth, that when the Romans were in the Carthaginian war, and Attilius Regulus the Con-Gelliss written, that when the Roman weter it to there was a Serpent of montrous quantity, ful had pitched his Tents near unto the River Braggada, there was a Serpent of montrous quantity, ful had pittined ins Tents near unto the tier to the Tents, and therefore did cause to the whole Arwhich had been loaged within the compaison the fines with flings, and many other deviles, they my exceeding great calamity, untill by casting of stones with slings, and many other deviles, they my exceeding great calaimty, until by carried fleyed off the skin and fent it to Rome, which was oppressed and slew that Serpent, and afterward slewed off the skin and sent it to Rome, which was oppressed and new that serpent, and although this seem to a beast of unmatchable sin length one hundred and twenty seet. And although this seem to a beast of unmatchable size in length one numered and twenty iter, relateth a ftory of another which was much greater, for ture, yet Possidonius a Christian Writer, relateth a story of another which was much greater, for ture, yet rojugonim a Christian writer, related as the form an acre of Land, and all the refidue both he writeth, that he faw a Serpent dead, of the length of an acre of Land, and all the refidue both of head and body, were answerable in proportion, for the bulk of his body was so great, and or near and body, were aniwerable in proportion, and the wideness lay so high, that two Horsemen could not see one the other being at his two sides, and the wideness lay to nign, that two rioriemen could not see one at one time within the compass thereof, a Horse of his mouth was so great, that he could receive at one time within the compass thereof, a Horse or his mouth was to great, that he could be feales of his coat or skin, being every one like a large and a man on his back both together: The scales of his coat or skin, being every one like a large buckler or target. So that now there is no fuch cause to wonder at the Serpent which is said to be killed by S. George, which was as is reported fo great, that eight Oxen were but strength enough to draw him out of the City Silena.

There is a River called Rhyndacus near the Coasts of Bythinia, wherein are Snakes of exeeding monstrous quantity, for when through heat they are forced to take the water, for their falegard against the Sun, and birds come flying over the pool, suddenly they raise their heads and upper parts out thereof, and swallow them up. The Serpents of Megalauna, are faid by Paulania to be thirty cubits long, and all their other parts answerable. But the greatest in the world are found in India, for there they grow to such a quantity, that they swallow up whole Bulls and great Stags. Wherefore I do not marvel that Porus the King of India, fent to Augustus Cafar very huge Vipersa Serpent of ten cubits long, a Torroise of three cubits, and a Partridge greater then a Vulture. For Alexander in his Navigation upon the Red-sea, saith; that he saw Serpents forty cubits long, and all

their other parts and members of the same quantity.

Among the Service, the Serpents come by great swarms upon their flocks of Sheep and cattel, and fome they eat up all, others they kill and fuck out the bloud, and fome part they carry away. But if ever there were any thing beyond credit, it is the relation of Volateran, in his twellth Book of the New found Lunds, wherein he writeth, that there are Serpents of a mile long, which at one certain time of the year come abroad out of their holes and dens of habitation, and deftroy both the Hends and Heard-men if they find them. Much more favourable are the Serpents of a Spanish Island, who do no harm to any living thing, although they have huge bodies, and great ftrength to accomplish their

In the Kingdom of Senega, their Serpents are fo great that they devour whole Bealts, as Gouls, and such like, without breaking any one of their bones. In Calechute, they are as great as their greatek Swine, and not much unlike them, except in their head, which doth far exceed a Swints And because the King of that Countrey hath made a Law, that no man kill a Serpent under pain of death, they are as great in number as they are in quantity: for fo great is his error, that be deemeth

it as lawful to kill a Man as a Serpene.

All kindes of Serpents are referred to their place of habitation, which is either thearth, or the waters of the earth; and the Serpents of the earth are more in number then the Serpents of the water, except the Serpents of the Sea: And yet it is thought by the most learned Rabbins, that the Serpents of the Sea, are fifthes in the likeness of Dragons. Now the places of Serpents about being thus generally capitulared, we must enter into a farther narration of their habitations, and regions of their native breeding. In the first place, India nourisheth many and divers forts of Serpeats, especiallying the Kingdom of the Children and the Chi the Kingdom of Morfillum, and elexander the Emperor, found among other Beafts, fundry kinds of Serpents in a long Defert, which is on the North-fide of India. But all the Nations of the World may give place to Ethiopia for multitude and variety, for there they gather together on heave and line an heaps, and lie in compass like round hills, visibly apparent to the eyes of them that behold them and off. The like is faid of all Africa, for in Numidia, every year there are many men, women and children defleased to Company the children defleased to Company the company to the company t children destroyed by Serpents. The Island Pharus, is also (by the testimony of the Espiral) filled with Serpents: The Coasts of Elymais are annoyed by Serpents; and the Caspians are lost noved by Serpents which the Coasts of Elymais are annoyed by Serpents. noyed by Serpents which come swimming in the floods, that men cannot fail that ways but in the Winter time. For from the beginning of the Spring, or equinoctial, they feem (for their num- Solling, ber) to approach ravening, like Troops and Armies. There are certain Islands called Ophinse inin'e. Elianu. named after Ophis a Serpent, for the multitude bred therein . And there are Serpents in Candy, Epher in. and all hot Countries , for this priviledge hath GOD in hature given to the colder Countreys. that they are less annoyed with Serpents; and their Serpents also less nocent and hurtful : and there. Cor. Cellus. fore the Serpents of Europe are fewer in number, leffer in quantity, and more refiftable for their Piering. weakness and strength.

Of Serpents in General.

There were a people in Campania called Ofci, because of the multitude of Serpents bred among them : Likewife there are great ftore in Lumbardy and Ferrara. And whereas we have faid, that Scalieer, themost nocent and harmful Serpents are bred in the hottest Regions, where they engender more feedily, and also grow into greater proportions, yet is it not to be understood of any special properry appertaining to thermalone, for I read in Olaw Magna his description of the Northern Regions, of Serpents of as great quantity as in any other place of the world; but yet their poylon is Boing near Livonia, there are great flore of great Serpents also, to that the Heard-men are at connual war and contention with them for defence of their flock. Likewill in the Mountains of Helwile and Avergne, whereof there are many wonders reported in the World, which I will not fland uoon to relate in this place. We read alfo, that fome places have been difinhabited, and dispeopled by Serpents, fuch were the people of Socia, called Neuri, who before the war of Darin, were confirmed to for sake their foil, because they were annoyed, not only with home-bred Servents. but allo with many other which came from other parts : and fo the Countrey remaineth desolate

The Mand Tenos, was called Hydruffa and Ophiuffa, so were Cremiufcos, Epolium, and the Eupelides. Mountains Macrocremnii, Rhodus, and the long Islands Ophiades in the Arabian coast, which after it had remained along time defert, was purged and cleared from Serpents by the Kings of Egypt. Nicameton allo calleth Cyprus, Ophiodia. And in Paufanias, we read of a place named Opheos Rephale, the Serpents head. The like might be said of Rivers, as of Orontes, called also Ophites, and Ophis Diod. Sigul. in Pontos, which divideth afunder Colchis, and the Countrey Thiamica. Ebufos nourisheth no Serpents, and the Barth thereof hath in it a secret vertue to drive away Serpents, wherefore je is much defired of all men to carry about them, for that it hath been often proved, that never any venomous beaft durft adventure upon any man possessed thereof. The like is faid of Ireland, Arrianus. sour own Chronicles do plentifully declare, and therefore I will spare to enter into any narration Suctonius.

to this present day, the ancient Inhabitants being all removed to dwell among the Buditani. The

City Amyola in Italy, (as M. Varro writeth) was destroyed also by Serpents. And there be der-

min places of the world, which have received their denomination from Serpents, besides the Ophle

ule near Crete.

To come therefore to the more particular abode of Serpents, especially of such as are known tous, we must leave off the talk and nomination of Kingdoms, and descend to dens, holes, caves, dunghils, Sheep-coats, valleys, rocks hollow-walls and trees, woods, green pastures, hedges, and fuch like places, wherein they make their most abode: And now and then in these Northern parts of the world (and yet feldom) they dive down into the bottom or roots of trees, especially such as aregreen all the Winter time : For they finde in them a greater heat or warmth, then in other, whole leaves fall off and decay in the cold weather, except in the roots of Birch. And by reason of their multitude gathered together at the root of this tree; it falleth out that their breath heateth the same, and so preserveth the leaves from falling off: Wherefore in ancient time, the ignorant multitude, seeing a Birch tree with green leaves in the Winter, did call it our Ladies Tree, or a holy tree, attributing that greenness to miracle, not knowing the former reason, or secret in Nature. Soling reporteth of such a like Wood in a part of Africa, where in all the Winter time, the leaves of all the trees abide green, the cause is as before recited, for that the Scrpents living at the roots of the trees in the earth, do heat them with their breath. Neither ought any man to wonder that they should so friendly live together, especially in the Winter and cold time, seeing that by experience in England, we know that for warmth they will creep into bed-straw, and about the legs of men in their fleep; as may appear by this fucceeding discourse, of a true history done in England, in the house of a worshipful Gentleman, upon a servant of his, whom I could name if it were needful. He had a servant that grew very lame and seeble in his legs, and thinking that he could never be warm in his bed, did multiply his clothes, and covered himfelf more and more, but all in vain, till at length he was not able to go about, neither could any skill of Physician or Chirurgeon

It happed on a day as his Master leaned at his Parlour window, he saw a great Snake to slide along the house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and to creep into the chamber of this lame man, then lying in his bed (as I remember) ber house fide, and the chamber of this lame man, then lying in his bed (as I remember) ber house fide in the chamber of this lame man, then lying in his bed (as I remember) ber house fide in the chamber of this lame man, then lying in his bed (as I remember) ber house fide in the chamber of this lame man, then lying in his bed (as I remember) ber house fide in the chamber of ber,) for he lay in a low chamber, directly against the Parlour window aforesaid. The Gentleman defirous to fee the iffue, and what the Snake would do in the chamber, followed, and looked into the chamber by the window; where he espyed the Snake to flide up into the bed-ftraw, by some way open in the bottom of the bed, which was of old boards. Straightway his heart rifing thereat, he called two or three of his fervants, and told them what he had feen, bidding them gotake their Rapiers and kill the faid Snake. The ferving men came first and removed the lame man (all remember) and then the one of them turned up the feed, and the other two the straw, their

Of Serpents in General. W

bottoms and roots of trees.

Notions and roots of trees, whetein they finde out their refting places, whetein they will be they perceive that Winter approacheth, they finde out their refting perceive that When they perceive that winter approachets, and again communicating her heaten all Creating half dead four months together, until the Spring Jun again communicating her heaten all Creating half dead four months together, until the Spring Jun again to life During which simple form he halt dead jour months together with them up from death to life During which time of cold Winter, tures reviveth, and (as it were) raiseth them up from death to life During which time of cold Winter, tures reviveth, and (as it were franceit etten poteff, pop defunt tuno illi venena, fed topent. They as Seneca writesh, Auto traditi's pestifica Serpens poteff, pop desunt tuno illi venena, fed topent. They as Seneca writern, Ano tracers positions served yours, and arrived poylon at that time, but be may be fafely handled, without fear of harm, not because they want poylon at that time, but be may be fairly nangieu, without test us afactus, and begins a question, whether when they bein this se cause they are drouzy, and deadly astonished. But there is a question, whether when they bein this se cause they are unousy, and underly que of the eat, or elfe their fleep be unto them in flead of food. Olege crefic or drouginess, they awake not to eat, or elfe their fleep be unto them in flead of food. Olege creite or grouzingly show awant and surveys that they cat not at all, but are nourished with steep.

Magnus affirmethy of the Northern Serpents, that they cat not at all, but are nourished with steep. Magnus amrmetiv of the Political food, as appeareth by those which are carryed up and down in Cardan laith, that they take tollie inche took, and the But this may be answered, that Serpent in boxes to be feen, and are fed with bran or cheafil. But this may be answered, that Serpent in boxes to be seen, and are see with order and Deferts: and therefore feeing cold keepeth them poxes, are not to come as those the box-house, or humane body which beareth them about, may from eating, the external heat of the box-house, or humane body which beareth them about, may be a cause, that inclosed Serpents feed in Winter as well as in Summer, and yet the Serpents which gen cause, that in the fields eat nothing at all, during the time of their Chias or Ehiam, that is, their ly,

Grevinus that learned man proponeth this question, Si Serpentes calidi funt, qui fit is imore me ing hid. ant quature menses, id est toto illo tempore quo delitescunt, absque cibo vivunt? If (faith he) Serpents be hot, how cometh it to pass that they can live three or four moneths without all food, that is, all the time of their lying secret? He maketh (in my opinion) a sufficient answer to this question, which for me shall conclude the cause, saying; Doth it not fall out with Serpents as it doth with some wo. men, who being full of humor, and thick phlegmatick matter, have but a little and weak named heat, (yet proportionable to the faid humor) do live a great time by reason thereof without food heat, (yet proportionable to the sails humor) do live a great time by reason thereof without food parties and for this cause, all the hoasts of Philosophers do define, that Serpens do also or pourishment? And for this cause, all the hoasts of Philosophers do define, that Serpens do also abstain from eating a long season. For Nature hath clothed them with a more solid skin, and line them with a more thick and substantial fiesh, to the intent that their natural heat should not easily vanish away and decay in their bodies, but remain therein permanent, for the feeding and preferring of life. When they fleep, they feem to fleep with open eyes, which is elegantly deferibed by Phila in these Greek verses :

Opos kathéude ka's doker palin blepein Ophie te kai ptox kai thumou pleics leon Epipetalaigar he chlamys ton ommaton

Alleu tinos Chitones bapaloterou. Phrorountos autois os dieptras, task oras.

Which may be Englished thus; How can the Hare, the Serpent, and the Lion bold, Both fleep, and fee together at one time? Within their eye-lids, a fost skin their sight doth fold. Shilding their apples, as glass doth weakened eyne.

The food of Serpents that is permitted them by God, is the dust of the earth, as may appearly that first and just sentence, which GOD himself gave upon them, for seducing our first Parents, the and Eve, Gen. 3. 14. Because thou hast done this thing, thou art accursed above all the Beath of the field, in thou Shalt go upon thy belly, and eat dust all the days of thy life. And again, Biay 65. 25. Duft Shall be med to the Serpent. And left that we should think that this curse hath not taken hold upon the Serpent, we may finde the express practise hereof, Mich. 7.17. where it is said of Gods enemies, that. They Mell lick the dust like the Serpent. Yet Aristotle affirmeth truly; that Serpents are Omitori, that is, devourers of flesh, fish, herbs, or any other things; howbeit, herein they passible that is, devourers of God reachest needs or any other things; howbeit, herein they passible that is a supplied to God reachest needs or any other things; howbeit, herein they passible that is not the passible that it is not the passible that the passible t or elfe the curse of God reacheth not to any other kindes then to that alone which deceived our first

We have shewed already, how they eat and devour men, women and children, Oxen, Sheep, and Goats, but what foever they eat, they retain nothing but the moisture of it, and the residue the eject whole and undigested. Whatsoever is offered them, that they take, either a bird, or a small chicken, or an egge having it, they take hold but of one end, as of the head of a chick, or fmall ed of an egge, and fo fet it directly before them; then do they gather them felves together in as thor a compais as may be, that so their bodies which seem long and small, being extended, may appear great and wide, reduced into a short and compacted frame. And surely hereby they open and mile wider their passage and swallow for then they suddenly goble in the beast or meat before them, with out any great ado; and having kept it in their body till it be dryed from all moisture, they are out again as they swallowed it up, at another ordinary place. But for birds and chickens, they fine with them till they have gotten off their feathers, or elfe, if they swallow them whole, they got the feathers or they have gotten off their feathers, or elfe, if they swallow them whole, they got the feathers or they do the feathers or they do they got the feathers or they do they got they got the feathers or they got they g the feathers as they do egge-fhells.

The Serpents of the North dointhe Summer time eat the neth of birds, and herbs, and after the eating of them, they take of a little water, or milk if they can accain it, or elie Wine. For the eating of them, they date of kine, or Goats, or Sheep, as bath been feen in England. Yet is their appetite to drink but small, as is in all other creatures, whose livers are sungous, and for like spunges; and so are all beasts and creatures which lay egges. Above all kindes of drink they love Wine, and thereof they be drunk; wherefore in Indy they fer pottles of Wine to en they love they for if once they finell the Wine, they enter the veffel gladly and speedily, and the Wine or Milk whereof they drink, is poyloned by them. But in those places of Africk where it never raineth, they eat a kinde of black moult worm, which hath many legs, as is faid by Theobtails, And to conclude, their meat and drink is fo fmall, that it is received for truth, Natlun venenatum perit fame vel jiti, that no venomous beaft perifheth by hunger or thirft.

The voyce of Serpents is called Sibilus, a histing, and their voyce different from all other Beafts hilling, in the length thereof: for the hilling of a Tortoife is shorter and more abrupt. Of this his

Quod frident ululantque fera, quod fibilat anguis. In English thus; Grashing and bowling is the voyce of wilde Beasts; Long biffing in Snakes and Serpents doth reft.

Among other things notable in a Serpent, this is one, because it casteth off his old age every year, whereof the Grecians tell this fabulous reason. Once Man-kinde strove earnestly with the year, and obtaining God by supplication for a perpetual youth, that they might never wax old: and obtaining their desire, they laid the same to be carryed upon an Ass. The filly Beast waxing sore atherit in his travail, at last came unto a water, and thereof endevoured earnestly to drink; but the keeper of the same water being a Serpent, denyed leave to the As to drink thereof, except he would grant him his carriage, which was Perpetual youth : The poor Als ready to perish for thirst, casily condescended thereunto. Whereupon the Serpent changeth her age for youth, and Men their youth for old age; and the Ais for his punishment, is more tormented with thirst then any

But to leave fables, and to come more neer the mark, the Latines call the casting off their skin, Anguins senectius, folium Serpentie, & vernatio; the Grecians, Opheas derma, Suphar, Leberis & Geta; the Arabians, Geluc & Genlut, & Falcalbaileb; the Italians, Spoglia delle Serpi: and the Spaniards, Philaculebra. About this Snakes skin there is great difference among Authors, some affirming it to be the very skin. Other, that it is nothing but a kinde of hard Leprofie, grown upon them during the Winter time while they lie hid. Some again say, that they cast it twice a year, first Elianus. in the Spring, and then secondly in the Autumn. But by conserence of all together it appeareth, Grevinus. that while the Serpents lie hid, by reason of their drought now in the beginning of the Spring when Olaus Magthey come first abroad, they rub off this skin by sliding betwixt two stones, or underneath some Textor. 1000 of a tree, or elfe betwixt some boughs or small trees, beginning at the head, and so continuing Pliny. to the tail. And within four and twenty hours, that which was raw and bald, beginneth to have another tkin upon it; and fo as a young childe or beaft cometh out of the Secondine doth a Serpent come

As concerning their eye-fight, they naturally do take the juyce of Fennel, which they eat, and by that recover their feeing again: and if it happen that they cannot finde fufficient, they rub their dim eyerthereupon. And if it happen that any of his scales be bruised, or fall senseles, then do Mercurialie. they rub themselves upon the thorns of Juniper. And whereas it is thought that they cast their Pliny. skins againin Autumn, that is to be attributed either to Vipers alone, which cast their skins twice a year, or elfe to those which are long before they cast, and so it falleth off in Harvest or Autumn the first time, which by reason of the unseasonableness, is thought to be a second coat. And this have I my felf often found here in England in the Summer time. The casting off this skin is thus ele-

Crudeles Divi! Serpens nous equit annos, Forme non ullam fate dedere moram. Anguibu exuitur tenui cum pelle vetustas: Cur nos angusta conditione sumus?

Which may thus be Englished;

O cruel Gods , fith Serpents change their yearly age, And Fates delay not to refine their form, Sib Snakes with tender skin excusi'd their years enlarge, Why unto worfer hap to Manhinde born?

Of the inward disposition of Serpents, and of their concord and discord with other Creatures.

Tis ever to our woe to be remembred, that which the Lord himself hath left recorded in Genefic I is ever to our was more subrile then all the beafts, which God had made. By which is expressed that, The Serpent was more subrile then all the beafts, which could be subriled than the subriled and college. For I which is expressed Lithat, The Serpent was more provine special above other to subtiley and policy; For I cannot approve the the natural disposition of this beast above other to subtiley and policy; For I cannot approve the the natural disponition of this beam above still the beginning might as well have used the tongue of an faying of them, who think that the Devilat the beginning might as well have used the tongue of an faying of them, who think that the Devilat has Sacratic him finally that all Sacratic him finally that the Devilat has sacratic him finally has sacratic him finally has been sacratic him finally had been sacratic him f faying of them, who tunnk that the Devillat the Devillat the September of the furely that old Serpent knew very Algor a Dog to have deceived Man, as well as a Serpents; but furely that old Serpent knew very After a Dog to nave deceived man, as well as a Sex peller; see land, and she select them all they which speak she contrary) that he could not have so fit a subject in all well, (better then all they which speak she contrary). well, (better then all they which speak and conning of a Serpent. And that this came not into the Serpent the World, as the shape, wit, and cunning of a Serpent. the World, as the inape, wit, and cuming of a perfect. The when the Devil framed his tongue to speak, may appear by the precept of our Saviour at that time when the Devil framed his tongue to speak, may appear by the precept of our Saviour at that time when the Devil rained his congained his congained and Dover. For if there had not been ma. Christ, where he saith; Be wife as Serpents, be innocent as Dover. For if there had not been ma. Christ, where he latter; De wife on Derfrent, as there is of meeknessina Dore, turally, some extraordinary faculty of understanding in this beast, as there is of meeknessina Dore, turally, some extraordinary faculty of understanding in this beast, as there is of meeknessina Dore, turally, some extraordinary saculty of understanding field with a Devil, but rather to some other his wisdome would never have sent us to a Serpent possess with a Devil, but rather to some other his wildome would never nave lent us to a set petite posters. And therefore I conclude, that ingenious Beaft, whereof there were great store in the World. And therefore I conclude, that ingenious Beau, whereof the serpent as speaking into Balaams Als, but rather by nature subtilty and prudence came not to the Serpent as speaking into Balaams Als, but rather by nature

And yet concerning this last sentence of our most blessed Saviour, I cannot but express the words of Telzes, who writeth thus upon it, Servate capita vestra, quemadmodum Serpens qui infidiu paine Of A Reizels will writern thus apon to, Serven condit, fie ves a tyrannis & implis crucialt, capit firms vapulanfque ad mortem, on nimodo caput fuum abscondit, sie ves a tyrannis & wapnianjque aa mortem, on nimous varas jamin ajamin mortem. That is, it is as much as if our Savione milbi, fidem vestram, o ne Deum negetie usque ad iplam mortem. That is, it is as much as if our Savione Christ should say; Even as when a Serpent is set upon and stroken, by all the means she can she hideth her head, and exposeth all her other parts to blows, reserving that sound; so you, when you are persecuted by Tyrants, preserve your head, that is, your faith, and deny not your God to death. And this thing is affirmed by all Writers, both divine and humane, which have ever touched this point, that above all the parts of the body the Serpent preserveth his. For Pliny faith, that if his body be cut off but two fingers length from his head, he will go away as if he had no harmatall, and

Paulus Fagius writing upon Genefis, faith; It is the opinion of some Hebrews, that the Serpent at the beginning did go upright, and was indued with all the affections of men: but this Jewishin. ble is not worthy to be confuted, because humane affection cannot proceed but from a ressonable foul, which to ascribe to the Serpent, were blasphemous and absurd. Besides, that then the soul might die, and that God had created such a foul, otherwise then by breathing into the body the

Serpents have many Epithets given unto them, as illiberal, perfidious, treacherous, venomous, poyfonful, flinging, implacable, furious, favage, mercilefs, devourer, and fuch like: And indeed the holy Writers, by a Serpent do understand implacable fury : For they are immitifimum animalium gmu, 1 most ungentle and barbarous kinde of all creatures, as may appear by the rage of a little Snake, one of the least of Serpents kinde : for when he perceiveth that he is hurt or wounded, heneverceaseth casting out his poyson, until he have done harm, or die for madness.

Two things I finde to be notable in Serpents, the first is proper to their kinde, the secondiscommon to them with Swine, Rats, and Mice. First, they are above measure kinde, not only to their young ones, but also to their Egges. For Funckius confidently sweareth, that at Lestorfium he sawa Str. pents Egge taken and cast into a hot furnace, and when it began to fry in the same, whether by matural inflinct, or by smell thereof, the old Serpent came, and would have run into the fire to setch it out, but that he and other strangers hindered her by killing her. And so likewise, if in a Wood one of them be fet on fire, all the Serpents that are within the favour thereof, or within the hearing of the histing, will instantly gather unto it, even as beasts when they hear one another roar. And so great is their love one toward another, (as Pliny and Textor write) that it was a vulgar faying, Serpentium morfie non petit Serpentes, one Serpent will not bite another. And Juvenal writeth;

Sed jam Serpentum major concordia-Scilicet, quam hominum inter se.

That is to fay; Better do Serpents with Serpents accord. Then Man with Man, who should be their Lord.

I cannot conceal a most memorable History as ever was any in the World; of a fight between the Serpents of the Land and the Water. This History is taken out of a Book of Schilbergon, Bavarian, who knew the same (as he writeth) while he was a captive in Turky, his words are the la the Kingdom called Genreke there is a City called Sampfon, about which while I was prifoner all Baiazeta King of Turkes, there pitched or arrived an innumerable company of Land and Witter Serpents, compassing the field City of a restrict an innumerable company of Land and Witter Serpents. ter Serpents, compassing the said City a mile about. The Land-serpents came out of the wood of Trienick, which are great and means and account of the wood of Trienick, which are great and means and means are said and means and means are said and means and means are said and mean of Trientek, which are great and many, and the water Serpents came out of the bordering

Of Serpents in General.

605

These were nine days together assembling in that place, and for fear of them there was not any that durit go out of the City, although it was not observed that they hurt any man, or living creature thereabouts. Wherefore the Prince also commanded, that no man should trouble them. or do them any harm, wifely judging, that such an accident came not but by Divine miracle, and that also to fignifie some notable event. Upon the tenth day these two valiant Troops joyned bartel early in the morning before the Sun-rifing, so continuing in fight until the Sun-set, at which rime the Prince with some Horse-men, went out of the City to see the battel, and it appeared to him and his affociates, that the Water Serpents gave place to the Land Serpents. So the Prince and his company returned into the City again, and the next day went forth again, but found nor a Serpentalive, for there were flain above eight thousand: all which he caused presently to he covered with earth in ditches, and afterward declared the whole matter to Baiazeta by Letters after he had gotten that City, whereat the great Turk rejoyced, for he thereby interpreted happiness to himself.

But I have been too long in this first and proper affection of Serpents, namely, their mutual concord; and this example of the Land and Water Serpents, doth not break the common promifed rule, because it is to be understood of Serpents that live in the same element. The second property Elianus. is to prefage Pestilence, rottenness of air, famine, floods, and ruine of those places wherein they are commorant, and have their abiding. fo do they know to chuse a good air, and fore-know ferility of fruits, earth-quakes and great tempefis. When Helice was deltroyed, five days before, the Serpents, Snakes, Rats, Mice, and Weafels, departed all out thereof, being wifer then Men, that mifdeeming no harm, although they saw and wondered at these removals, yet stood it out to their own nter ruine, overthrow and destruction.

of the friendship and enmity which Serpents keep with other Creatures.

Ver fince the Devil entered into the Serpent, it became hateful to all, or the most part of the L bealts of the field, so that it may as truly be verified of the Serpent as it was of Efau, that the bands of all Men and Beafts are against them, (except very few) for they are strangers to all, and findevery few or no friends. Yet it is reported, that the Serpent and the Fox will live peaceably together in one cave or lodging. There is a story, not unpleasant, of a Man that found a Serpent enclosed betwirt two stones, and at the intreaty of the Serpent, he loosed him out of danger, and did him no harm. The Serpent being released and free from death, in stead of other recompence for so good a turn, told the Man that he had been therein a long time inclosed, and was very hungry, and therefore was forced (against his will) to make the best of his fortune, and therefore must needs eat the Man, and bad him prepare himself for death. The Man astonished at this motion, replyed to the Serpent, that he hoped he would not deal fo with him, having delivered himfrom death, now to put his deliverer to death: and faid moreover, that he would not be the Judge of his own case, but refer the same to the next they found : and the Serpent also yeelded tothat judgement, being affured that no creature would quit the Man, lest he should cast his own life into peril. Forth then they went and met with an Ass, to whom the Man told the difference betwixt him and the Serpent, how kindely he faved the Serpents life, and how unkindely he again would take away his life. And then the Serpent bade the As consider what judgement he gave, and for whom he spake. The As adjudged it lawful for the Serpent to kill the Man. Lo now, faid the Serpent, make you ready, for the matter is judged against you, and withall, began to make force at him with mouth and fting. But the Man faid, that he would not take this Asses deree for reasonable, and therefore prayed the Serpent to tarry yet a little longer, and try once more the next Beaft they met withall; and the Serpent thinking himself sure of the booty, yeelded thereunto. Then forth they passed again, and shortly after met with a Fox, to whom the Man related his case, and the benefit he had done to the Serpent: The Serpent again confessed he released him, but withall, denyed his case to be as the Man had said, so desperate, but only he entrapped himself the better to compass a booty. The Fox having heard them both, (defirous to end the matter for the Mans benefit) would needs go with them both to the place where the Serpent was inclosed, and so all parties consented. And when the Fox came thither, he bade the Serpent go into the same place again, that so he might the better judge of the whole matter. The Serpent went in again betwixt the stones, and was so inclosed as he was before, for he could not stir neither backward nor forward. Then the Fox asked the Man if this were the Serpents case, from which he had delivered him? The Man answered yea, in all points. Then he bade the Serpent come out again, as he said he could, without the help of the Man. But the Serpent called the Man to help him again. Nay, faid the Fox, I found you two at variance, because of your descharge from this place, and seeing now you are as you were before, and the Man as he was before your enlargement, my fentence is, that when you come forth of that place you are in, then shall you eat the Man: and if he will let you forth again, I will never pity him. By this fable is shewed, that Foxes love not Serpents so well as they love Men, and yet they never love Men, but they are afraid, suspicious, and willing to forsake their

Penzettus.

Some fay there is a kinde of love betwirt Serpents and Cats, whereof I finde this flory in Ponzelling. Some lay there is a kinge of love betweet of period and the Phylitians could not tell.

There were certain Monks, who all of them fell fick upon a fudden, and the Phylitians could not tell. There were certain Monks, who all of them ten form form form for the fervants of how or whence this fickness came, except from form feeret poyson. At last, one of the servants of how or whence this neknels came, except from Joine Acts table, to play with a Serpent; and there, the Abbey, faw the Cat which was daily fed at the Monks table, to play with a Serpent; and there, the Abbey, law the Cat which was uany led at the National Bolt or left fome poylon upon the Cats by it was conjectured, that the Serpent having in his sport lost or left some poylon upon the Cats by it was conjectured, that the serpent having in the therewith. And the cause why the Cat was skin, the Monks by stroking of the Cat were insected therewith. And the cause why the Cat was skin, the Monks by moking of the Cat were interested the poyfon from the sport, and not from the anger of not harmed thereby, was for that she received the poyfon from the sport, and not from the anger of e Serpent.

And this thing furely is not fo marvellous, feeing that little Mice and Rats do also play with Ser-

And this thing jurily is not to marvellous, feeing that herefoondence and peace both with the pents, and herein Politicians play the Serpents, who hold correspondence and peace both with the pents, and herein Politicians play the Serpents, who had natural enemies together. The like peace and league Cat and the Moufe: that is, with two fworn and natural enemies together. The like peace and league Cat and the Moule: that is, with two two that any more plainly appear by this following History, of a cer-they are also said to keep with Eeles, as may more plainly appear by this following History, of a cer-

tain Monk called Redolphus a Will Monachus Capellensis.

in Monk caused Reauspum a resustantiam of his fellow Monks, which did often tell him, that be.
There was (as this Monk affirmeth) one of his fellow Monks, which did often tell him, that be. There was (as this Monta and the state of the water fide, he hapned to catch an Eele, which he ating a little boy, and using to sport himself by the water fide, he hapned to catch an Eele, which he ating a little boy, and using to sport himself by the water fide, he hapned to catch an Eele, which he attempted (for his own pleasure) to carry to another water, and by the way as he went, he passed the Bala bagget his based to be tempted (for his own pleasure) to early to another the Wood, the Bele began to his and cry mainly, through a Wood, at which time when he was within the Wood, the Bele began to his and cry mainly, through a vyoud, at which time which the description and the hearing whereof, there gathered together very many Serpents round about him, infomuch at the meaning whereon, the Basket fast pinned and ran away; afterward he came again and that he was afraid, and fet down his basket fast pinned and ran away; afterward he came again and that he was alraid, and let down in some the Eele therein, wherefore it was supposed, that the Serfought for his basket, but he found not the Eele therein, wherefore it was supposed, that the Serfought for his basket, but he found not the Eele therein, where fore it was supposed, that the Serfought for his basket, but he found not the Eele therein, where fore it was supposed, that the Serfought for his basket, but he found not the Eele therein, where fore it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein, where some it was supposed in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket, but he found not the Eele therein in the Serfought for his basket for his rought for this passet, but he round not the basket, by fome fleight of nature: the only doubt is, whe pents delivered the same Eele out of the basket, by fome fleight of nature: the only doubt is, whe ther Beles do his or not, feeing they are fishes, and Omnes pisces muti, all fishes are mute or dumb. But for answer to this objection, it is most certain that Beles have a voyce, as all they know which But for answer to this objection, the have not only heard fuch a voyce in the night time in Rivers, use fishing in the night; for I my self, have not only heard fuch a voyce in the night time in Rivers, and other waters where Eeles abounded, but have had it confirmed by divers other, of greater practife and experience in fishing. The reason whereof, may be their manner of generation; practife and experience in fishing. The reason whereof, may be their manner of generation; practife and experience in fishing. The reason whereof, may be their manner of generation; practife and experience in fishing. not from Serpents in their external form, except in their colour, and therefore may be faid to partake with Fishes and Serpents in both their natures: that is, having a voyce like a Serpent, and a fubstance like a Fish. Such is their confederacy with living Creatures, and with no more that I ever

But moreover, it is faid that they love some Plants or Herbs above measure, as the Fennel and Ivy; and for this later, both Pliny and Textor do not without great cause wonder, that ever there was any honour ascribed or given to the Ivy, seeing that Serpents (the most unreconcileable enemies of man-kinde) delight fo much therein. But herein the Devil blinded their reason, as he did the modest women, that worshipped Priapu; or the Tartars, which at this day worship the Devil, to theend that he should do them no harm. Thus much I can only say of the friends and lovers of Serpents, by the multitude whereof we may conjecture, how among other parts of the curse of God upon them,

they are held accurfed both by man and Beaft.

Now then it followeth, that we enter into a more particular description, or rather a relation of that hatred which is between them and other creatures, and first I will begin with their archenemy, I mean Man-kinde For when GOD at the beginning did pronounce his sentence against the Serpent, for deceiving our first Parents, among other things he said, I will put enmity betwiet thee and the Woman, betwiet thy seed and the Womans seed. Whereby he did signific that perpetual war, and unappealable discord, which should be for ever (by his own appointment) betwixt them. And the truth hereof is to be seen at this day, for by a kinde of secret instinct, and natural motion, a man abhorreth the fight of a Serpent, and a Serpent the fight of a man. And as by the tongue of the Serpent, wis wrought mans confusion, so by the spittle of a mans tongue, is wrought a Serpents astonishment For indeed fuch is the Ordinance of God, that Men and Serpents should ever annoy and vex each other. And this Erasmus faith shall continue, as long as meminerimus illius insuspicati pomi, we shall remember that unfortunate Apple.

Issuring faith, that Serpents are afraid of a man naked, but will leap upon, and devour a manclothed. Which thing is also affirmed by Olam Magnus, for he saith, that when he was a boy he often tryed it, that when he was naked, he found little or no resistance in Serpents, and did safely with At Season oak out all danger combat with them hand to hand. I my felf also in my younger time, when I was about in Kim, which ten or twelve years old, used many times in the Spring and Summer time, to wash my self with other my Colleagues, in certain fish-ponds, wherein I have seen and met with divers Water-snakes with out all harm; and I did never in my life, hear of any harm they did to any of my fellows being naked, neither did I ever fee any of them run away fo fast on the land, as they did fly from us in the water, and yet are not the Water-snakes less hurtful then the Land-adders. And this was well known to

About the beginning or Fountain Springs of Euphrates, it is faid, that there are certain Serpents which know frangers from the people of the Countrey, wherefore they do no harm to the might be and the state of the countrey. tural born Country-men, but with strangers, and men of other Countreys they fight with might and the standard of the Country strangers and men of other Countreys they fight with might and the standard of the Country strangers and men of other Country strangers and men of other Country strangers are strangers. main. And along the banks of Euphrates in Syria, they also do the like; saving that if they change to be trade upon by any of the color to be trode upon by any of the people of those parts, they bite (like as a Dog doth) without any great harm; but if any other, for ainer or ftranger annoy them, they also repay him with maker,

Of Serpents in General.

for they bite him, and intolerably vex him; wherefore the Countrey-men nourish them, and do them no harm. Such as these are also found in Tirinibus, but they are very little ones, and are thought to be engendered of the earth.

The first manifestation in nature, of Mans discord with Serpents, is their venom; for as in a Serpent there is a venom which poyloneth a Man: fo in a Man, there is the venom of his spittle which poyloneth a Serpent. For if the fasting spittle of a Man fall into the jaws of a Serpent, he certainly dyeth thereof. And of this, thus writeth the Poet Lucretime

Est utique ut Serpens, bominis que tacta salivis Disperit, ac sese mandendo conficit ipsa. In English thus; As Serpent dyeth when spittle of Man be tasteth, Gnashing bis teeth to eat bimself be wasteth.

The cause of this, the Philosophers (which knew nothing of Adams fall, or the forbidden Apple) Pierius. do affign to be in the contrariety betwixt the living fouls or spirits of these Creatures: for the Serpents life is cold and dry, and the Humane life hot and moift, wherefore either of both abhorreth one the other; and the Serpent leapeth as far from a Mans spittle, as it would do out of a vessel of

scalding water.

Ataibarfides writeth, that there was a King in Africk called Pfillus, whose Sepulchre was preserved inthe greater Systes. From this King there were certain people named Phlians, in whose bodies there was a certain inbred and natural power to kill, or at the least to astonish Serpents, Spiders, Toads, and such like, and lay them for dead, even by the favour or smell of them. And the manner of these men, to try the chastity of their Wives, was to take their children newly born, and to cast them unto direful Serpents : for if they were of the right line, and lawfully begotten, then did the Serpents die before them, but if they were adulterous, and the children of strangers, the Serpents would eat and devour them. Pliny affirmeth, that even in his days there were some of those people alive among the Nasamons, who destroyed many of them, and did possess their places; yet some tunning from death, escaped. Generally, such people were called Marsi and Psili, for the Marsi were apeople of Italy, descended of Circes (as is said) in whom there was a vertue to cure all the stinging of Serpents, by touching the wounded places. Such faith Crates Pergamenus, are in Hellefpont, about the River Pariss. And some are of opinion, that at the beginning they were Ophiogenes, born or bred of Serpents; or that some great Nobleman, father of that Countrey, was of a Serpent made a man. And Verro faith, that in his time there were some sew men alive, in whose spittle was sound that vertue, to refift and cure the poyfon of venomous Beafts.

But having named Ophiogenes, or Anguigene, that is, Men bred of Serpents or Snakes, I fee no cause whyit should be judged, that those which cure Serpents poyson, should be so misjudged; for to ture poylon, is not the work of poylon, but of an Antidote, or contrary power to poylon: and therefore curers and refifters of poyfon, are without all learning called Ophiogenes, that is, Serpents brood: but rather, that term belongeth more justly to those people, whose nature is sociable with Strpents, and Serpents agree with them, as they would do with their own kinde. Such an one was Exigm the Embassadour of Rome, who at the commandement of the Consuls, (for their experience) was cast naked into a vessel or tun of Snakes, who did him no harm, but licked him with their tongues, and so with great miracle, he was let forth again untouched; and yet there is no more reafonto say, that this man was born of the linage of Serpents, because those Men-enemies did not hurt him, then it was to fay, that Daniel was born of Lions, because that the Lions did not harm him. Or that Komulus and Remus were born of the kindred of Wolfs, because a she Wolf did nourish them. We do read of many people in the World, which were furnamed of Serpents, all which may as well be deemed to be descended of such creatures, because of their name, as well as the other, who were by GOD for their innocency preserved from death.

Etulu vias called Colubrazia, and the people thereof Ophiusse, and in Arabia we read of the Ophiades, both which are derived from Serpents, called in Greek, Ophew Eustathim also relateth a story of a man called Ophia. I omit to speak of the Ophine and others; yet thus much I must needs say, that

commonly fuch names have been given to Serpents, for some cause or accident, either faignedly or truly derived from Serpents. So we read of Opbion, a companion of Cadmus, and a builder of Thebes, who was faid to be made by Pallas of a Dragons tooth. Likewise the Spartanes were called Oph odeiroi Calius Rho.

by Pythim, because in a famine they were constrained to eat Serpents.

S. Anguitine maketh mention of certain blasphemous Heretiques, who were called Ophica, because they worshipped a Serpent, and said that the Serpent which deceived our first Parents Adam and kvdb, was Christ. Wherefore they kept a Serpent in a Cave, whom they did nourish and worship, which at the charm of the Priest would come out of his Cave, and lick the Oblations which they fee upon his Den; rowling and folding himself round about them, and then would go in again: then did these abominable Hereticks break these oblations into the Eucharist, and receive them as sanctified by the Serpent. And such also is the story of Calius Rhod. where he tearmeth the great Devil Ophioness, whom both holy Scripture, and ancient Heathen say, that he fell out of Heaven. But all these things are but by the way, upon occasion of that unnatural conceit of those men called Ophiogenes: that is, descended or begotten by Serpents. Therefore I will return where I

LOA belongs to Sir Ralph Bollivile, Knight, & c.

Alianus. Pliny.

ldit, namely, to the hatred of Men to Serpents, and of Serpents to Men again: In testimony where. ldic, namely, to the natred of Men to Serpents, and of Serpents willed monftrous Serpents, and Serof, there have been mutual flaughters, namely Men which have killed monftrous Serpents, and Serof, there have been mutual flaughters, namely Men which have killed monftrous Serpents, and Serof, there have been mutual flaughters, namely Men which have killed monftrous Serpents. pents which have killed men again.

Diod. Sicul.

ents which nave kined men again.

Heroules being but an Infant, (as Poets faign) killed those two Serpents which Juno sent to his Hercules being but an initialit, (as roces languarded at his birth, because he was begotten by cradle to destroy him; for Juno is said to be much offended at his birth, because he begotten by cradle to destroy him; for June is said to be situate on the Image of Hercules at Athens, strangling Jupiter upon Alemena; and therefore there was referred the Image of Hercules at Athens, strangling Jupiter upon Alemena; and therefore there was read moral or Hieroglyphick, when he faith, that by Serpent. But Pierius maketh of this fiction a good moral or Hieroglyphick, when he faith, that by Serpent. But Pierius makern of this fiction a good not those men which are born for any Hercules strangling of the Serpents in his cradle, is understood, how those men which are born for any Hercules itrangling or the Serpents in his crause, is understoos, I need not to fland long upon this great enterprises, should kill their pleasures while they be young. I need not to fland long upon this great enterprises, inouia will their pleasures while they be should be both men and women, which are not point, for it is evident, that to this day there are many Hyades, both men and women, which are not point, for it is evident, that to this day there are many Hyades, both men and women, which are not point, for it is evident, that to this day the at the same of the d by Serpents, I mean men of any note, are afraid to kill the Serpents brood. But fuch as have perified by Serpents, I mean men of any note, are afraid to kill the Serpents proou. But luttle as have perfined and Alizothoes, who following the also expressed, whereof Ovid writeth of Elacos, the son Priamm and Alizothoes, who following the also expressed, whereos Ovia writeth of Anacos, the following the Nymph Hesperia, (with whom he was in love) was suddenly killed by a Snake biting his foot. So were Apesantus, Munitus, Eurydice, Laocoon, Ophelies the son of Lycurgus King of Nemes, Orfies, Idama and Moplus, slain by Serpents: whereof Ophelies, by the negligence of his Nurse Hypsphile, leaving him ungarded in his cradle.

in ungarded in his craule.

It is recorded by Elianus and Pling, that when a Serpent hath killed a Man, he can never morecoer himself in the earth, but in punishment of so vile an offence, wandereth to and fro, subject to ver millien in the earth, but in pulliment acknowledged by his female if he be a male, nor yet by the male if it be a female; and is forfaken of all his crew or fociety. The earth it felf not daigning to entertain a man-murtherer into her bowels, but constraining him to live Winter and to entertain a man-muremeter into not And thus hath the Divine Providence dispensed his justice, that he suffereth not murther of men to be unpunished among the greatest haters and ene-

What monsters therefore are they which have Serpents in their delights, and admire that in them which should be hated of all men. And how base were those minded Grecians, which worshipped the Serpent for a God? Or the Athenians, which kept a Serpent in their Temple, for an opinion that the same did conserve their Tower or Castle from all enmity. Jupiter was also worthipped in many places in the shape of a Serpent. And the ancient Borussians worshipped a natural Serpent of the earth. It is strange to consider the errour of the King of Calechut, who doth as severely punish the flaughter of a Serpent, as he doth the flaughter of a Man; and not only restraineth his subjects from harming them, but also buildeth for them little coats, wherein they safely lodge in the Winter And the cause of this errour, is their conceit, that they think Serpents are Divine powers dropped out of Heaven, which they prove, because when they sting siercely, they quickly kill, and dispatch their enemy suddenly. Wherefore they think that no creature can kill so speedly, except an Angel of God. Some of the Heathen had their Ophiosephale Beasts with Serpents heads, which they did worship for a God. And the Poet Virgil hath an excellent description of Anes his factificing to the ghost of his Father Anchifes,

Gellius.

Ælianus.

Herodotus.

Æneas Syl.

-Adytie tum lubricus anguie ab imie Septem ingens gyros septena volumina trakit Amplemus placide tumulum, lapfufque per aras Carulea cui terga nota, maculofus & auro Squammam incendebat fulgor : ceu nubibus arcus Mille trabit varios adverso sole colores, Obstupuit vifu Æneas, ille agmine longo Tandem inter pateras, & lavia pocula Sepent Libavitque dapes , rur su que innocins im Successit tumulo, & depasta altaria liquit.

Which may be thus Englished: Then from the bollow boles, a sliding Snake appeared, Which feaven ways did winde and turn, and dead mans tomb embrace, Gliding along the Altar from, and back, with colour cleered, By Sun-fhine-light, like forts of gold each varied to the face A thousand biews ; whereat Encas marvelled : but yet at last, This Snake the boly diffies, and smoothest cups of choice Did haft to touch, like as it would the facreds taft, And fo funk down from Altar clean, without both harm or noife.

Lampridius.

And to make an end of this Section, of the Antipathy betwixt Men and Serpents, that wholeever is of the Womans feed, may profess himself an enemy to the Serpent, let him but consider how that hateful monfter Heliogabalus, having by the help of the Marfick Priests gathered together many Serpents, one day in the morning, when the people were gathered together to fee fomerare and unheard of spectacle, suddenly he let loose the Serpents, and hurt many of the people. Izazzi telleth another story, of a devise or warlike stratagem, how Serpents by slings or trunks, were sent abroad among the Camps of their enemies. So doth Galen, of Serpents included in an earthen pot, and call like darts among the Tents of the Romans. And fo did Hannibal shew to Antiochus, how ins battel by Sea, he might shoot Serpents among the Mariners to his Enemies, and hinder their row. ing: for when he did follow the fame devife at Prufie, he went away Victor and Conqueror. And the I will consider the state of the stat thus I will conclude this part, with the Emblem of Alciatus, which he wrote unto the Duke of Millia upon his Arms, being an Infant proceeding out of a Snakes jaws, Exilient

Pierius.

Frillens Infans sinuosi è faucibus anguis. EA Gentilitiie nobile stemme tuie. Talia Pelleum gefife numifmata regem Vidimm bifque juum concelebraffe genm

Out of the mouth of winding Snake. Great Duke, this is thy Greft. Aleaping Infant making Scape From james, a mofull reft : The like Goat did Pelleus King Upon hie filver preffe, As we have feen, the fame to fine Of Kindreds wortbineffe.

Dum fe Ammone fatum, metrem anguis imagine lufa. Divint & fobolem numinie effe docet. Ore exit, tradunt fic quosdam enitier angues. An quia fic Pallas de capite orta Jovis ? In English thus

For whiles of Jove he glorieth, Descended of his rate, He feigns bis mother like a Snake. Born of Divinest grace.

But why proceeding from the mouth ?

Some Serpents to are bred, Or elfe that Pallas iffueth Out of great Jove bis bead.

And the like by the same Author is expressed upon this Theam, That the wisdome of man is fooliftnife with GOD; therefore upon the unnaturall conjunction of two mortall enemies, framed into one body, he thus writeth elegantly:

Quid dicam, quodnam hoc compellem nomine Monstru? Biforme quod non est bomo, nec est draco. Sed fine vir pedibus, fummis fine partibus anguis Vir angui-pes dici, & homiceps anguis potest: Anguem pedit home, hominem rullavit & anguis,

Nec finis bominis est initium, nec est fera. Sio olim Cecrops dollin regnavit Athenia, Sic & Gigantes terra mater protulit. Het vafrum fecies, sed & religione carentem Terrena tantum quique curet induat.

That is to fay; What shall I call? or bow this Monster rightly name? Biformed, which nor man nor Dragon, in all the fame. But man unlegged, and Snake unbeaded : doubtfull parts, Man Inake, Snake-man, exceeding humane arts. Mans tail breeds Snake, and Snake a man up-caftetb, One end is not of man, nor other of wilde beaft tafteth. Such one was Cecrops, learned Athens King, And Giants such did earthly mother bring. Mishapen then, an earthly minde expressett, Devoid of grace for worlds good only wisheth.

Thus then I will leave to talk of our most just (and by GOD ordained) hostility, betwirt men and Serpents, and descend to a particular discovery, how Serpents and other beasts are for mans lake at the like enmity. And first of all I will begin with the Fowls, and so descend to Fourfooted beafts, and Infects, or imperfect creatures.

Eigles are alway in warre with Serpents, from an high they efpy them, and suddainly flie down upon them, with a great noyle or cry, tearing out their bowels, and casting aside their venom or poylon. And some (as Albertu) say, that they will in particular deal with Vipers, Tigers, and Dragons, when she seeth them hunting those small beafts or birds which are her prey. This fight is thus described by Virgil, how the Eagle griping the Serpent in her talons, flyeth into the air.

Utque volans alte raptum cum fulva draconem Fert Aquila, implicuitque pedes, at que unquibus bafit. Sauciu & Serpens, finnofa volumina verfat,

Arredis horret fquammis, & fibilat ore. Ardune insurgens : illa band minus urget adunco Luciantem roftro, simul athera verberat alia.

In English thus As Eagle flyeth on bigh, and in her clawes a Dragon beareth, Folded within her feet, wounded, dying to her talons cleaveth. The Serpent fierce now windeth round, and with her head erected. Hissing out threats, rough scales upsetteth that were dejetted, To fright her fo : but all in vain, for fhe with beak doth ftrive, And beat the air with wings of force, till Dragon cease to live.

There is in the seventh book of Elianus History of living Cretures, a notable and elegant story of an Eagle which was almost overcome by a Serpent, and yet preserved and made Conquerour by a man. There was (faith he) fixteen men which were threshing of corn in the heat of the Sun, by reason whereof they became very thirsty, then they agreed to send one of their company to a Fountain not far off, to fetch fome water for them all to drink; and fo the Meffenger coming to the Fountain, found an Eagle almost killed by a Serpent: for whiles from an high she beheld the Screent, being more greedy of the prey for to feed her young, then wary to avoid danger, fell down upon her booty, which was too strong for her; for the Serpent received her adversary with fell force, power, and preparation to stiffe her, and so indeed she had accomplished, had not by chance this thresher come unto them: for the Serpent had so ensured and wrapped up the

Eagle with her long body, that she was nearer ad pereundum quam ad perdendum, that is, to bekilled, then to kill, or get a prey. The Man beholding the fight, with his sickle cut afunder the Serpent, and so delivered the Eagle: but how the Eagle required the Man, shall be shewed in the history of the Eagle.

history of the Hagle.

In the Mountains of Morfilium, there are great store of great Serpents, which are very dangerous, In the Mountains of Morfilium, there are great store of great white Eagles, which do eat and destroy them. Some say that the Vulture doth destroy Serpents, but herein I cannot be satisfied, for all Eagles do not hunt after this game, but destroy Serpents, but herein I cannot be satisfied, for all Eagles do not hunt after this game, but only the lesser sort of them. Eagles when they build their nest to breed in, they seek out a certain stone called Actives, the vertue whereof keepeth Serpents from their young, and also make their eggs fruitful, so as it is a very rare thing for Eagles to have a rotten eggs.

P. Venesus. Aristotle. Philostratus.

Solinus.

fruitful, so as it is a very rare thing for Eagles to have a storage of the stora

Serpente ciconia pullos
Nutrit, & inventa per devia rura lacerta.
In English thus;
The Stork her young ones, according to kinde,
In Serpents and Lizzards, do their meat finde.

Sometimetime they fight together irefully, and the Serpent strangleth the Stork by twyning about her neck; again, the Stork killeth the Serpent by pecking upon her head, and so sometimes they are both sound dead together. As the Eagle hath the stone Active, so hath the Stork led-nites, to desend herself and her young ones from the rage of Serpents. There is (as Oppianus written in his Ineuticia) this vulgar story in Italy. There was a certain Serpent, which came two years together to the nests of divers Storks, and destroyed their young ones, neither could all the Sorks ther to the nests of divers Storks, and destroyed their young ones, neither could all the Sorks make sufficient force against her with all their might to save their brood. The third year the Serpent came again to attempt the like slaughter; but there among the Storks she sound a certain strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bill strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bill strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bill strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bill strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bill strange Bird never seen before, being shorter then the Storks, and yet had a great long starp bit strange Bird strange of them. Then, assorted to see the storks of the Storks, but the guardian Bird, (according to the trust committed to her) resisted the Storks, but the guardian Bird, (according to the trust committed to her) resisted the Storks, but the guardian Bird, sad endeavoured to reach the Bird, but the wary Bird soared so high above his reach, that the langerel Serpent could not catch him, and so the south serves and so we only saltened his venomed teeth upon the Bird, which afterward so wrought upon this Bird, that all her feathers did slie off from her back.

But of all other Fowls enemies to Serpents, there is none greater or more deadly, then the Bird called Ibis, which the Egyptians do wonderfully honour; for when swarms of Serpents contents of Egypt, out of the Arabian gulfs and fens, these Birds meet and destroy them: and fall sense is such an admirable fear in Serpents of these Birds, that they do not only tremble, and fall sensels at the sight, but also at the sight of their feathers: they do harm to no other living thing, except Locust and Caterpillers, wherefore they are worthily nourished, and called Inimice & populaters Serpents.

All kinde of Pullen, as Cocks and Hens, are likewise enemies to the brood of Serpents. And a good couragious Cock, (as Columella saith) is able to kill and resist a Serpent. For, (as Kondoletim saith) be hath found in the crop or craw of Pullen, young Serpents devoured by them. But from where albertum had his relation, that a Hen cannot be hurt that day by a Serpent wherein she layeth an Egge, I cannot tell, and therefore leave it to the Reader to believe or refuse.

cannot tell, and therefore leave it to the Reader to believe or retule.

And it is also faid, that the flesh of Hens applyed to the bitings of Serpents, doth cure them, or else cause a Hen to sit upon the wounded place; but if the Beast which is wounded, be a Cow with Cais, or any such other femal with young, howsoever it fareth with the old one, surely the young

 being able to hinder or refift their chick-devouring foes. But at the last, when they fee all their young ones diffacthed, as if they could not endure to live for forrow, or elfe thinking it possible to sy into the finakes belly to fetch our again their devoured young ones, they fall down upon their enemits laws, doing what they can to make them devour and swallow them aip also. And thus Oppianur, but the series of the listred betwire fowls and Serpents: Wherein, although they kill the Serpent, either in their own describe, or elfe for raven and pray, yet may we admire the prudence of the most mighty Creator, who hath so disposed of his powers that he causeth the Fowls of Heaven to revenge Mans quarrel upon the Serpents of the earth, by whose subtilty Man was plucked from Heaven, and they mide labelet to corruption.

made hibject to corruption.

In the next place, God hath also framed an opposition betwice Serpents, and the Beasts of the earth and water, which live with Serpents in the same Elements that so they might be both annoyed as home and abroad. I will therefore begin with the Dog, who is a notable enemy to the Serpents, as my self have seen many in England, for he will earnestly seek them out with nose and soot, both in waters, dunghils, and hedges, and when he hath found any one, he will suddenly snatch him into his mouth, biting him about the middle, and so holding it in equal poyse, will sling and snake it about his ears very sast and violently, till he perceive it can stir no more, and then suddenly ugain stretch it fall out of his mouth to the earth; but if it begin to stir, he snatcheth it up again; and shaketh it about his ears as before, and so never giveth over till it appear dead: but they seldom kill them, only they astonish them, and so may a young childe knock out their brains. Howbeit, when they sight in desence of their Masters, then they kill them, by biting them in pieces. And yet is it more safe for them, to astonish them, and leave them for dead, by shaking them about their ears, or bitten by the Serpent. And this I have seen often in mine own experience. But one of the greatest enemies of Serpents are Harts, a timorous beast of all other, and yet greedy to combat with the Serpent, wherefore I will briefly describe this their war and harred, out of Solinus, Elianus, Plutarch, and Oppianus.

The Hattwill greedily follow out the path of the Serpent, and finding it lodged in his den or hole, by the vertue of his nofe draweth it out of the Earth, and thereof some have derived Elepor, a Hart, of Elaunein tous opheis, that is, driving away of Serpents. And herein I think it not reaonto follow the opinion of Ælianus, who intreating of Harts drawing Serpents out of the earth, faith, that the Serpent is inticed and allured out of her hole, by the breath of the Hart, as by a Philtreor Cup of love; for feeing that there is fo great an hostility, and antipathy in nature, betwike their whole disposition, how can it come from any secret sympathy, that the Serpent (which is the subillest of of all beasts) should be bewitched with the love of his enemies breath? But if it be said that Serpents, which are by nature very cold, can eafily be drawn forth by a warmer breath, as it unebythe sweet beams of the hot Sun; how then falleth it not out, that when any other Beaft brankth upon their lodging, and into their dens, they are not removed? But let it be granted that thewarmness of the Harts breath, maketh him for fake his den, yet it cannot be ascribed to any secret insture, as if there were a fire of love in the Harts throat or bones, but only from the natural concomitant quality of heat, with exspiration, respiration, and inspiration: and therefore I cannot but conclude, that there is not any possibility or probability in nature, that where the spirits, which take and make the breath, are at fuch variance, there the breath proceeding from the one advertary, should so inchant and beguile the other.

But the true cause of this extraction of Serpents out of their lodgings, is, as I conjecture, not her warm breath that allureth, nor yet scorcheth and burneth her adversary; but that when the Hare hath found the den of the Serpent, by her violent attraction of the air out from the Serpent, she enforceth it for the safegard of life to follow it out of the den. As when a vessel is broched, or vented, the Wine followeth the flying air; or as a Cupping-glass draweth bloud out of a scarified place of the body: and so is a Serpent against her will, drawn to follow the breath of her destroyer. Orbbasis and Gunterius do subscribe unto this opinion, and take it for most consonant to reason and truth, and therefore I will not follow it any further: for by the self same manner do the Sea-Rams draw the Sea-calfs out of their lodgings among the Rocks under the earth, for when they have found the Calf, they keep it from air, and prevent their refrigeration.

When the Serpent feeth himself so drawn forth by his adversary, he being above measure incensed to tage, syeth away, and maketh his poyson more notiome, violent and powerful, for which cause, there was wont to be a Proverbial caveat or warning: Cave ne incideris in Serpentem, quaim extrasta & latin ambeliu cervi effugerit, tum enim proprer iracundiam veheminitusei veninumuss. Take heed lest youncet with a Serpent slying away from the Hart, after the is drawn out of her den by her breath, for then, by reason of her rage, her poyson is more for cible. But I will proceed to the more strange and wonderful combate betwixt Serpents and Harts. For when the Serpent perceiveth the unavoidable danger, and that she must needs fight for her life, she hisself strongly, lifting up her head from the earth, even to the throat of the Hart, and thereat catcheth and gnasheth with her teeth; but on the other side, the valiant Hart, (if such a word may be given to a seaful Beast) as it were deriding his adversaries weak endevours to harm, suffereth the Serpent to winde about his breast and kelly, and to embrace both neck and legs with his long and weak body, that so he may have the more power upon it, for he teareth it into an hundred pieces.

pions to end their lives upon and with their adversary) do still hold fast, and even when their bo.

pions to enu their neces, their heads stick close, and hang sharp upon the Harts skin, as though they would grow with him, and never fall off till he should also fall down dead. But the Harr

feeling some ease, and having by the slaughter of their bodies delivered his feet from threstome

by a divine naturall inftinct, flyeth and runneth fast to some adjoyning fountain, where he seeketh

by a divine natural mininet, system a medicine, that fhaketh off their heads which cleave fo fall in. to him, and also cureth all their wounds and poylon. This valiant courage is in Hartragains

Serpents, never yeelding tyring, or giving over, and yet otherwise, are afraid of Harcrand Co.

But what is the cause of this hostility betwirt Harts and Serpents? Is it for meat, or for medi.

cine and cure? Surely they would abhorre to eat them, if it were not for health and naturall me.

dicine, for fometimes the pores of their body are dulled and flut up, fometimes the worms of their belly do ascend up into the roof of their mouths while they chew the cud, and therecleive

faft; for remedy whereof, the Hart thus afflicted, runneth about to feek for Serpents, for the

eating of a Serpent cureth this malady." Pliny faith, that when the Hart waxeth old, and perceived that his strength decayeth, hair changeth, and his body begins to be feeble, then for the remaind of his strength, he first devoureth a Serpent, and afterward runneth to some fountain of water.

whereof when he hath drunk, he findeth a fenfible alteration, both in horn, hair, and whole body,

And this thing is also delivered by the Writer of the Glosse upon the 42. Plaim, which beginneth,

Like as the Hart defireth the water fpringt, fo longeth my foul after my GOD. But for the ending of this

question, we must consider and remember, that there are two kindes of Harts, one authSer.

pents, and feeling the poyfon to work, ftraight way by drinking casteth up the poyfon again,

or elie cureth himself by covering all his body over in water. The other kinde only by nature

killeth a Serpent, but after victory forbeareth to eat it, and returneth again to feed in the Moun-

and Solinus write as followeth. When the Elephants called Serpent-killers, meet with the Dra-

gons, they easily tread them in pieces, and overcome them, wherefore the Dragons and greater

Serpents use subtilty in stead of might; for when they have found the path, and common way of

an Elephant, they make such devises therein to intrap him, as a man would think they had the devise of men to help them, for with their tails they so ensnare the way, that when the brast cometh, they intangle his legs as it were in knots of ropes; now when the beaft stoopeth down

with his trunk to loofe and untie them, one of them suddenly thrusteth his poysoned head into his

trunk, whereby he is strangled. The other also (for there are ever many which lie in ambush) st

upon his face, biting out his eyes, and some at his tender belly; some winding themselves about his

throat, and all of them together, fling, bite, tear, vex, and hang upon him, untill the poor beily

emptyed of his blood, and swollen with poylon in every part, fall down dead upon his adverse-

ries, and fo by his death kill them at his fall and overthrow, whom he could not overcome being

alive. And whereas Elephants (for the most part) go together in flocks and troops, the subtile Serpents do let passe the foremost of every rank, and set only upon the hindermost, that so one of the Elephants may not help another; and thefe Serpents are faid to be thirty yards long.

Likewife, forasmuch as these Dragons know, that the Elephants come and feed upon the leaves

of trees, their manner is to convey themselves into the trees, and lie hid among the boughs, co-

vering their foreparts with leaves, and letting their hinder parts hang down, like dead parts and

members; and when the Elephant cometh to brouze upon the tree-tops, then fuddenly they les into his face, and pull out his eyes, and because that revenge doth not satisfie her, thirling only

It is reported that the blood of Elephants is the coldest bloud in the world, and that the Driving has found in the found in the state of the state

gons in the scorching heat of Summer, cannot get any thing to cool them except this blowle for which cause they hide themselves in Rivers and Brooks, whither the Elephants come to drith, and when he are the state of the state

and when he putteth down his trunk they take hold thereof, and inflantly in great numbers in

up into his ears, which only of all his upper parts are most naked and unarmed, out of which by

after death, the twineth her gable-long body about his neck, and fo strangleth him-

In the next place, great is the variance betwixt Serpents, Dragons, and Elephants, whereof Pling

tains. And thus much for the discord betwixt Harts and Serpents.

nies by nature.

whereof the Ancients made their Cinnabaris, which was the best thing in the World to represent bloud in painting. Neither can any devise or art of man ever come neer it; and beside, it hath in it a rare vertue against poyfon. And thus much for the enmity betwixt Serpents and Elephants.

Of Serpents in General.

The Catallo by Albertus is faid to be an enemy to Serpents, for he faith the will kill them, but not eat thereof; howbeit, in her killing of them, except the drink incontinently, the dyeth by povion. This relation of Albertus cannot agree with the Monks of Mesuen their relation about their Abby-cat. But it may be that Albertus speaketh of wilde-cats in the Woods and Mountains, who may in ravin for their prey kill a Serpent, which followeth with them the same common game,

The Roes or Roe-bucks do also kill Serpents, and the Hedge-hog is enemy unto them, for some times they meet both together in one hole, and then at the fight of the Serpent, the Hedge hog finds they meet our round, so as nothing appeareth outwardly, save only his prickles and sharp brilles: the angry Serpent setteth upon him, and biteth him with all her force; the other again, draineth herself above measure, to annoy the Serpents teeth, face, eyes, and whole body: and thus when they meet, they lie together afflicting one another, till one or both of them fall down dead in the place. For fometime the Serpent killeth the Hedgehog, and fometime the Hedge-hog tilleth the Serpent, fo that many times the carrieth away the Serpents flesh and skin upon her

The Wealels also fight with Serpents with the like successe; the cause is, for that one and other Aristotle. of them live upon juyce, and so for their prey or booty, they fall together in mortall warre. Perotius. Herein the Weasel is too cunning for the Serpent, because, before the fighteth, the seeketh Rue. Isldorus. and by eating thereof quickly discomforteth her adversary. But some say, that she eateth Rue af- Elianus. terward, to the intent to avoyd all the poyfon the contracted in the combat.

The Lyonalfo and the Serpent are at variance, for his rufling mane is diffouraged by the extollad head of the Serpent to his breaft. And therefore as S. Ambroje faith, this is an admirable thing, that the Snake should run away from the Hart, the most searfull of all other beafts, and yet overcome the Lyon, King of all the relidue.

The lebreumon or Pharos Mouse is an enemy to Serpents and eateth them, and because he is too seeble to deal with a Snake alone, therefore when he hath found one, he goeth and calleth as many of his fellowes as he can finde, and fo when they find themselves strong enough in company, they set upontheir prey, and eat it together; for which cause when the Egyptians will signific weaknesse, Bellonius. they paint an Ichneumon. The Peacock is also a professed terror and scourge to Snakes and Adders, Grus. and they will not endure neer those places where they hear their voice. The Soren and Swine, do allo hate and abhor Serpents, and the little Soren hath most advantage against them in the Wintertime, when they are at the weakest. To conclude, the Horse is wonderfully afraid of all kindes of Supraisif he fee them, and will not go over, but rather leap over a dead Snake. And thus I will end the warre betwixt Serpents and Four-footed beafts and Fowls.

Now lest their curse should not be hard enough unto them, God hath also ordained one of them to destroy another, and therefore now it followeth to shew in a word the mutuall discord betwitt themselves. The Spider, (although a venemous creature) yet is it an enemy to the Serpent; for when the feeth a Serpent lie under her tree in the shadow, the weaveth or twifteth a Pliny. threddown from her web upon the head of the Serpent, and fuddenly biteth into his head a mortal wound, fo that he can do nothing but only roul to and fro, being stricken with a Megrim, wheretarwand, to that he can no nothing out only to Spiders thred hanging over his head, untill he be by he hat not so much power as to break the Spiders thred hanging over his head, untill he be dead and overthrown. The Cockatrice is such an enemy to some kinde of Serpents, that he killeth Etasmai.

The Lizard a kinde of Serpent is most friendly to man, and very irefull against Serpents, to the uttermost of his power, whereof Erasmus (in his book of Friendship) telleth this story : I saw (faith he) on a day, a very great Lizard fighting with a Serpent in the very mouth of a Cave, at the first fight whereof I marvailed at the matter, for the Serpent was not visible out of the earth : there was with me an Italian, who faid, that furely the Lizard had some enemy within the Cave. After a little while the Lizard came unto us, and shewed us his side all wounded, as it were cra-

man being affeep, the Lizard ran to the man, and never ceased running upon the mans face, fraching his neck and face gently with his clawes, untill he had awaked the man; and fo discoveredto him his great danger. The Locust also fighteth with a Serpent, and killeth him when he lusteth, for he getteth hold with his teeth upon his lower chap, and so destroyeth him; but this is not to be understood of every kinde of Locust, but only of one kinde, which for this cause is called Ophiomachum genus.

upon them, and except the Chamælcon can cover herself from his rage, he hath no defence but death. Albertus calleth a certain Worm, Speliator colubri, because (as he saith) it will take fast bold upon a Serpents neck underneath his jawes, and never give over till he hath wearied and dedroyedhis adversary. The Tortoises are enemies to Serpents, and will fight with them, but before they enter combat, they arm themselves with wilde Marjoram or Penniroyall.

ting help, for the Serpent had bitten him fore, for of green he made him appear red, and this Liard did fuffer himself to be touched of us. Thus saich Erasmus.

Again, in the same place he saith, that where Lizard saw a Serpent lye in wait to set upon a

The Serpent is also an enemy to the Chamaleon, for in the extremity of famine, the serteeth Ettanus.

Ælianus.

Thrafilm. Pliny. Ælianus.

But there is not any thing in the world that fighteth more earnestly against Serpents then Sea-But there is not any thing in the Sun is in Cancer, Serpents are naturally tormented with pains and crabs and Creviles, for when the built in or bitten with Serpents, they cure themselves by eating of seavers, and therefore if Swine be stung of builting of the with season and therefore is Swine be stung of the with season and the feavers, and therefore it Swine be nuing of Ephelus, attheone fide whereof there is a Cave full of many Sea-crabs. I nere 13'a great watch fittings by often probation, have been very deadly both to men noviome and irefull Serpents, whose bittings by often probation, have been very deadly both to men noylome and trettin perpetus, whole brings endevour to crawl over the pool; now on the other and beafts. These Serpetts do often times endevour to crawl over the pool; now on the other and beatts. These serpents do often who when they fee the Serpents come crawling or fwimming. tide, there are great note of two legs, and as it were with tongs or pinfers, reach at the fliding they initiantly put out their from the servent are fo deterred, that through their fight, and often remembrance Serpent, wherewithan the with them, they turn back again, and never dare any more adventure to the other fide. Where we may see the most wise providence of the Creator, who hath set Sea. the other fide. Where we may see the most wise provided which are on the opposite fide: crabs the enemies: of Serpents, to guard both men and Cattell, which are on the opposite fide: crabs the enemies or Serpents, to guard, or elfe be drove away from their dwellings. To for otherwise, the initialities, but also some kinde of earth, and Plants are enemies to Ser. conclude, not only niving offenties, and Creet, as fome fay, although Bellinius fay, that pents: And therefore most famous are Ebulus and Creet, as fome fay, although Bellinius fay, that pents: And therefore thou familiary, mar there are Scolopendraes Vipers, and Slow-worms in Creet, yet he faith they are without venom and there are sery few in England and Scotland, but none at all in Ireland, neither will they live if they be brought in thither from any other Countrey. This antipathy with Serpents, proceedeth from living to dead and vegetable things, as trees, herbs, and plants, as may be feen by this discourse following.

There is such vertue in the Ash-tree, that no Sergent will endure to come neer either themorning or evening shadow of it, yea though very far distant from them, they do so deadly hate it We fet down nothing but that we have found true by experience: If a great fire bemade, and the same fire encircled round with Ashen boughs, and a Serpent put betwixt the fire and the Ashen boughs, the Serpent will sooner run into the fire, then come neer the Ashen boughs: Thus fairh Pliny; Olaus Magnus faith, that those Northern Countreys which have great store of Ash-trest do want venemous beafts, of which opinion is also Pliny. Callimachus faith, there is a Tree growing in the land of Trachinia, called Smilo, to which if any Serpents do either come neer or touth, they forthwith die. Democritus is of opinion, that any Serpent will die if you cast Oken-leave upon him. Pliny is of opinion, that Alcibiadum, which is a kinde of wilde Bugloffe, is of the same weard quality; and further, being chewed, if it be spit upon any Serpent, that it cannot possibly live In time of those solemn Feasts which the Athenians dedicated to the Goddesse Ceres, their women did ufe to lav and ftrew their beds, with the leaves of the Plant called Agnes, because Serpentecould not endure it, and because they imagined it kept them chaste, whereupon they thought the name

was given it. The herb called Rosemary, is terrible to Serpents.

The Egyptians do give it out, that Polydamna, the wife of Thorris their King, taking pity upon Helen, caused her to be set on shore in the Island of Pharus, and bestowed upon her an hearb (whereof there was plenty) that was a great enemy to Serpents; whereof the Serpents having a feeling sense (as they say) and so readily known of them, they straightwayes got them to their lurking holes in the earth: and Helen planted this herb, who coming to the knowledgethereoffhe perceived that in his due time it bore a feed that was a great enemy to Serpents, and thereupon Elecampane in was called Helenium, as they that are skilfull in Plants affirm; and it groweth plentifully in Phanus, which is a little Isle against the mouth of Nilus, joyned to Alexandria with a Bridge. Rue, (called of fome Herb of grace) especially that which groweth in Lybia, is but a back friend to Serpents, for it is most dry, and therefore causing Serpents soon to faint and lose their courage, because (as Simcatus affirmeth) it induceth a kinde of heavinesse or drunkennesse in their head, with a vertigory or giddiness, through the excess of his driness, or immoderate ficcity. Serpents cannot endure the favour of Rue, and therefore a Weafel when fhe is to fight with any Serpent, eateth Rue, sado fensative against her enemy, as Aristotle, and Pliny his Interpreter are of opinion.

The Countrey-people leaving their Vessels of Milk abroad in the open fields, do besmear them round about with Garlick, for fear lest some venemous Serpents should creep into them, but the smell of Garlick, as Erasmus faith, driveth them away. No Serpents were ever yet feen to touch the herb Trifolie, or Three-leaved graffe, as Aedonnus would make us believe. And Cardan the Physician hath observed as much, that neither Serpents nor any thing that is venemous, will lodge, dwell, nor lurk privily neer unto Trifolie, because that it is their bane, as they are to other living Creatures: and therefore it is fown to very good purpose, and planted in very hot Countreys, where there is most ftore of fuch venemous Creatures. Arnoldus Villanovanus faith, that the herb called Draconin killeth Serpents. And Florentinus affirmeth, that if you plant Wormwood, Mugwort, and Sothers wood about your dwelling, that no venemous Serpents will ever come neer, or dare enterprise invade the same. No Serpent is found in Vines when they flourish, bearing flowers or blossoms, for they abhor the smell, as Aristotle saith. Avicen an Arabian Physician, saith, that Capers doe ill Worms in the guts, and likewise Serpents. If you make a round circle with the herb Betony, and therein include any Serpents; they will kill themfelves in the place rather than ftrive to get aust Galbanum killeth Serpents only by touching, if Oyl and the herb called Fennel-giant be mixt within There is al furub called Therienarca, having a flower like a Rofe, which maketh Serpents heavy, dil, and drowsie, and so killeth them, as Pliny affirmeth.

Albertus and Kyranides affirm, that there is a certain Tree in Afia, called Hyperdiocu, which foundeth as much as Against the right hand, with whose sweet fruit Doves are delighted; but there are Sereth as finite hare fore enemies to the Doves; fo lying in wait for them, and not being able to abide the fmell & shadow of the tree, the Doves not with standing very safely do there in the tree seek their refuge, and finde food wherewith to fultain, themselves. Refu (who practifed Physick one hundred relige affirmeth, that if any man do melt Sal Almoniack in his mouth, and then spit it into a Serpents mouth, that he will die of it.

Of the Medicines made and taken ont of SERPENTS.

Tis manifelt, that if any man be wounded of a Serpent, though the wound feem incurable, that Remedies to be The bowels or inward parts of the same Serpent, being applyed to the wound, will cure the had and taken same; and those that have eaten the liver of a boyled Viper at any time, shall never after be from Serpents. wounded of any Serpent. Neither is a Snake venemous, unlesse at some times of the Moon, when heis throughly moved or angred. And a live Snake or Serpent being caught, if the bitten place bebathed, loked, or washed with the Snake being bruised in any water, it is of notable effect. Besides, they are thought to be very soveraign against many infirmities, and therefore (as Pliny (aith) they are dedicated to Alculapine.

Avien laith, that if any be troubled with the Leprosie, he is to be cured by taking a black Serbeing excoriated, he must be buryed so long till there breed Worms of him, and then heisto betaken forth of the earth and dryed, and fo to be given to the leprous person for three dayes together, the quantity of one dram at every time, with syrup of Hony. Phiny, and with himagreeth Cornelius Gelfus, affirmeth, that if any one do eat the middle part of Snakes or Serpents, calling away the heads and tayls, they cure Strumes, which we in English call the Kings-evil. There is a dilease called Enephantia, or Elephantiasis, which is a kinde of Lepry proceeding of melancholy, choler, and flegme, exceedingly adult, and maketh the skin rough, of colour like an Elephant, with black wannish spots, and dry parched scales and scurf: This disease (I say) so grievous, and Strumes, are exceedingly holpen by eating often of Vipers and Serpents, as John Taganet in his first Book Institut. Chirurg. hath affured us.

Pliny faith, that if you take out the right eye of a Sorpent, and so binde it about any part of you, that it is of great force against the watering or dropping of the eyes, by means of a rheum issungout thereat, if the Serpent be again let go alive. And so he saith, that a Serpents or Snakes heart, if either it be bitten or tyed to any part of you, that it is a present remedy for the toothache: and he addeth further, that if any man do tafte of the Snakes heart, that he shall never after

behart of any Serpent.

Peulus Venetus in his fecond Book, Chap. 40. writeth, how that in the Province of Caralam, there be Serpents of exceeding greatnesse, which being killed, the inhabitants of the Countrey dopull out their gall, which they use to prize at a very high rate when they fell any of it, for it is but the quantity of a penny weight of this gall, they are presently cured. And if a woman be in hettravail of childe-birth, if the tafte never so little of this gall, the birth will be the more speedy. So if any betroubled either with the Pyles, or Hemorhoids in the fundament, if that the place be anounted with this gall, after a few dayes he is fet free from his difease. Hippocrates giveth the feed of Serpents as a remedy against the suffocation of the belly.

Nicholan Myrepsus prescribeth this medicine against strains and hardnesses. Take a dead Serpent and put him into a new pot, luting it very well with Gypfum, then fet it in a furnace that it may be burnt, after that, commixe the ashes of a Serpent with an equall portion of the seeds of Fenugreek, so being wrought up with Attick Hony, and throughly digested, anoynt the place affected. And with him agreeth Pliny, who expresly affirmeth, that the ashes of Snakes and Serpents, being anounted upon Strumes, either with Oyl or Waxe, is a fingular medicine. And likewife to drink the ashes of a Serpent that is burnt to powder in a new earthen pot, is very good: but it will be the more effectuall, if the Serpents be killed between two tracks or furrowes that are made with Carr-wheels. The ashes of a Serpent burnt with talt in a pot, being put with Oyl of Rofes into the contrary ear, helpeth the toothrache.

An unquent against the Morphue, preseribed by Olaus Magnus. Take of the ashes of a Serpent burnt in a new pot, and well covered, two ounces, Lytharge, Galbanum, Ammoniacum, and Opogonam, disolved in Vinegar, three ounces, boyl them untill the Vinegar be consumed, then strain them, putting to them of Turpentine three ounces, Frankincense, Mastick, and Sarcocolla three ounces, Saffon two ounces, working them with a Spathuler till they be cold. The powder of a burnt Serpent, is likewife good against Fistulaes. The fat of a Snake or Serpent mixt with Oyl, is good against Strumer, as Pliny laith. The fat of Snakes mixt with Verdegrease, healeth the parts about the eyes that have any rupture. To which agreeth the Poet, when he faith:

Anguibus ereptos adipes arugine misce, Hi poterant rupt as oculorum jungere partes. Which may be thus Englished; The fat of Snakes mingled with Iron ruft, The parts of eyes doth mend, which erst were burft.

Ælianus. Confiantinus.

Ælianu.

English.

Albertos

Ιc

It is certain that barrenness cometh by means of that grievous torment and pain in childe birth; and yet Olympin of Thebes is of opinion, that this is remedied with a Bulls gall, the fat of Serpents, and Verdigrease, with some Hony added to them, the place being therewith anointed before the coming together of both parts. When a Woman is not able to conceive by means of weakness in the retentive vertue, then there is no doubt, but there must needs grow some membrane in the belies entrance, for which it is not amiss to make a Pessay of the sat of a Serpent, Verdigrease, and the sat of a Bull mixt together, &c. and to be applyed, Hippocrates in lib. de Sterilibus.

fat of a Bull mixt together, etc. and to the project of the English and of a Serpent was sent to him Gesser had a friend who signified to him by his Letters, that the sat of a Serpent was sent to him from those sulphureous bathes which were neer unto Cumertacum, and was sold at a very dearrate, namely, twelve pounds for every ounce, and sometimes deerer. They use to mix it with the emplaister of John de Vigo; (that samous Chirurgeon) for all hardnesses, and other privy and unseen plaister of John de Vigo; (that samous Chirurgeon) for all hardnesses, and other privy and unseen chough not unselv) torments proceeding of the Spanish pox. They use it yet surther, against leprous swellings and pimples, and to smooth and thin the skin. Matibiolus saith, that the sat of a black Serpent, is mixt to good purpose with those Ointments that are prepared against the French of black Serpent, is mixt to good purpose with those Ointments that are prepared against the French of black Serpent, is mixt to good purpose with those Ointments that are prepared against the French of black Serpent, is mixt to good purpose with those Ointments that are prepared against the French of black Serpent, is mixt to good purpose with those Ointments that are prepared against the French of black Serpents decocked with the flowers of Cowslips, (ever remembring to gather and take that Oylof Serpents decocked with the flowers of Cowslips, (ever remembring to gather and take that which swimmeth at the top) is singular to anoint podagnical persons therewith.

Now followeth the preparing of Serpents: Take a Mountain Serpent, that has black back, and a white belly, and cut off his tail, even hard to the place where he fendeth form his taback, and take away his head with the breadth of four fingers; then take the refidue and fquere out the bloud into some vessel, keeping it in a glass carefully, then sley him as you do an Eele, be out the bloud into some vessel, keeping it in a glass carefully, then sley him as you do an Eele, be ginning from the upper and geosfer part, and hang the skin upon a stick and dry it, then sliving the middle, and reserve all diligently. You must wash the sless hand put it in a pot, boyling it in the middle, and reserve all diligently. You must wash the sless not put it in a pot, boyling it in the middle, and formatical and Cordial powders, and so eat it. But if you have a mindeto rost it, it spices, and Aromatical and Cordial powders, and yet that it may be brought into powder, and the powder thereof must be eaten together with other meat, because of the loathing, and dreadly mine, and conceit of a Serpent: for being thus burned, it preserveth a Man from all fear of any situate, and conceit of a Serpent: for being thus burned, it preserveth a Man from all fear of any situate, and expellent that which is present. It keepeth youth, causing a good colour above all other pry, and expelleth that which is present. It keepeth youth, causing a good colour above all other pry, and expelleth that which is present. It keepeth youth, causing a good colour above all other pry, and expelleth that which is present. It keepeth youth, causing a good colour above all other pry, and expelleth that which is present, the eye-sight, gardeth surely from gray hairs, and keepeth from Medicines in the world; it clearest the eye-sight, gardeth surely from gray hairs, and keepeth see eye-sight, gardeth surely from gray hairs, and keepeth see eye sight, gardeth surely from gray hairs, and keepeth see eye sight, gardeth surely from gray hairs, and keepeth see eye sight.

You may also finely mince the heads and tails of Serpents, and feed therewith Chickens or Geese, being mingled with crums of Bread or Oates, and these Geese or Chickins being eaten, they help all to take away the Leprosie, and other soulness in Mans body. If you take the dryed skin, and lay it upon the tooth on the inner side, it will mitigate the pain thereof, specially if it proceed from any hot cause. In like fort, the same skin washed with spittle, and with a little piece of the tail laid upon any Impostume, or Noli me tangere, it will tame and master the pain, causing it to putresse more easily and gently, and scarcely leaving behind any cicatrice or skar. And if a Woman being in estimate the pain in Childe-birth, do but tie or binde a piece of it on her belly, it will cause the bind immediately to come away. So the skin being boyled and eaten, performeth the same effects that

The bloud of a Serpent is more precious then Ballamum, and if you anoint your lips with a little it, they will look passing red: and if the face be anointed therewith, it will receive no spot of step, but causeth to have an orient or beautiful hew. It represents all seabliness of the body, sinking the teeth and gums, if they be therewith anointed. The fat of a Serpent, speedily helpethall retents, spots, and other infirmities of the eyes, and being anointed upon the eye-lids, it elevent the eyes exceedingly. Item, put them into a glassed Pot, and fill the same with Butter in the Month eyes exceedingly. Item, put them into a glassed Pot, and fill the same with Butter in the Month eyes, then sute it with well with Passe, (that is, Meal well kneaded) so that nothing may expose the first the Pot on the fire, and let it boil weldigh half a day; after this is done, from the butter through a cloth, and the remainder beat in a mortar, and strain it again, and mix them to gether; then put them into water to cool, and so referve it in silver or golden boxes, that which is not evaporated, for the older, the better it is, and so much the better it will be, if you can keep is not evaporated, for the older, the better it is, and so much the better it will be, if you can keep it sorty years. Let the sick Patient, who is tooubled either with the Gowt, or the Passe, elpedanoint himself often against the fire with this unguent, and without doubt he shall he freed, elpedally if it be the Gout. All these prescriptions, were taken from the writings of a certain namels.

Author.

Hippocrates faith, that a Hart or Stag having eaten any Serpents, the worms in their guts are thereby expelled. And Absyrtum hath the same words, that Harts by eating of a Serpent, do till thereby expelled. And Absyrtum hath the same words, that Harts by eating of a Serpent, the standard expell worms from their guts. Hierocles, to a certain medicine which he prepared for the Stangulion in a Horse, mingled the dung of a Lyzard, and Stear berpetuou, (that is, as I interpretit) the stat of a Serpent, the bloud of a Dove, &c. Laurence Russum sait, that it is good to give the stehn decoction of Serpents to madde, biting; and striking Horses. And that the sat of a Serpent, &c. doth

doth cure the puffing or Iwellings that arife in Horses backs, which come by means of any compression or close fitting and thrushing down

lists. The unguent that droppeth from a Serpent, whilest he is rosted on a spit, is highly commended for Fishulaes that are in Horses hoofs. Galen and Rasius do counsell us to cut in pieces a Snake or Serpent, and to lay the far thereof upon a stick, and to anoysit the outward parts of the hoof of any Horse. Horseleaches, live Mice, the green Lizard being burned, if they be given to a Hawk in her meat, they do cause a speedy mutation of her feathers or wings; and the same effect have little River-sishes, sinely beaten or stamped, if they be cast upon any meat.

haw, the Serpent that is speckled, and of divers and sundry colours, of all others hath the least poylon; and in the Gaman tongue it is called Huf, (peradventure it is that which we call a Snake) if (lay) you take this Serpent, and boyl it with Wheat, and give the same Wheat to a Hen to feed upon, being mingled amongst her meat and drink with the venom of a Serpent; a Hawk being sed with the sleep of such a Hen, forthwith casteth her sick feathers, and is freed from any other disease, if the have any at all, as Albertus saith.

The old skin of an Adder or Snake, that he casts off in the Spring time, if it be rubbed upon the eres, cleareth the fight, as Pliny faith. And Galen biddeth us, if any be troubled with bloud-shotten eys, cleareth the light, and of Serpents, & being beaten with Sea water, to anoint them therewithal.

And Candan faith, that the cast skin of a Snake, if the eyes be rubbed therewith every morning, that they will never be very dim of fight, nor yet ever have any pin or web in them. Amongst com-politions that are made for the eyes, they use to mix the cast skin of Snakes, as Diocles affirmeth; adding further, that the old age, or cast skin of a Snake being boiled in Wine, is an excellent helpfor pain in the ears, if a little thereof be dropped into them. Boyl the cast skin of a Snake with tops of Poppy, and drop a little thereof into the ears, if any be troubled with pain thereof, and this is an excellent remedy, as Galen in his third Book, De Composit. medicam. fie. loca, hath taught us, having himself learned the same from Archigenes. The cast skin of Serpents being burned in a pot, oronahot burning tyle-shard, if it be mingled with Oyl of Roses, and so dropt into the ears, is proved to be very effectual against all fores, and ficknesses of the ears; but especially against the thinking favour of them : or if they be purulent or full of matter, then to be mixt with Winegar. Some use to mingle Bulls gall therewith, and the juyce of the flesh of Tortoises being boyled. Marcellas faith, that if you take the gall of a Calf, with a like quantity of Vinegar, and mix them with the cast skin of a Serpent, if then you dip a little Wooll into this medicine, and put it into the ear, that it helpeth very much, especially if wich a spunge being soked in warm-water, you stiff soment the ear. Dissertes and Galen do affirm, that the cast skin of a Serpent, if it be boiled in Wine, doth cure the tooth-ach, if the pained place be washed therewith. But yet, initolerable pains the teeth, this is proved more fingular. Take the cast skin of a Serpent and burn in then temper it with Oyl, till it come to the thickness or consistence of hard Honey, and cover the tooh being first scoured and cleansed therewith, anointing all the neer places to the same, and put foncof it into the hollowness of the tooth. And as Archigenes faith, if you lay the cast skin of a Snake unto the teeth, not being burnt, they will all fall out. It cureth likewise the lowsie still called Phihiriafis. And Galen prescribeth this cast skin of Snakes or Serpents, for a remedy against the Colick, if it be put into a brass pot with some Oyl, and so burnt to powder, if then it be dissolved in Oyl, and the place therewith anointed, it is of great vertue. And if it be boiled in a Tin vessel with some Oyl of Roses, it remedieth the Bloudy-flix, and such as be troubled with Tenesmus, which is, a great desire in going to stool, and yet can do

Armidu de Villa nova, in his Breviary faith, that if you take the cast skin of a Serpent, Opopanax, Myrthe, Galbanum, Castoreum, yellow Sulphur, Madder, Pigeons or Hawkes dung, and incorporate them with the gall of a Cow, they being first pulverised, and the same thereof received through a tunnel at the lower parts, it bringeth forth either the dead or living birth. Cardan lib. de Subiil. shith, that the cast skin of a Serpent burned in the full of the Moon, and entring into the first degree of dies; if the aftes thereof be fprinkled on the head, that thereby terrible and fearful dreams will follow. And if the face be anointed or washed therewith, being first laid in water, that it will cause one to look very fearfully and horribly : and if it be held under the congue, it will make one very wife and eloquent : and if it be kept under the foals of the feet, it maketh one very gracious among Princes, Magistrates and Great men. And another faith, that this cast off skin being pultrifed when the Moon is in her increase, and in the first degree of Artes, if the powder thereof be fton the table, in a wooden or metalline difth; if any poylon be therein, it will be dispersed and dono hurt, and yet the powder will remain fafe and whole: and if given to a Leprous person, his diale will spread no further. And if you put a little of this powder into any wound, it will cure it within three days. I have feen (faith Gelen) Goats that have earen of the boughs and leaves of Tamanik, and I have found them without a Spleen: alfo I have feen other Goats that have licke up Serpents after they had caft their skin; and I have proved, that after that, they have grown very white, and to have kept their young years a great while; fo that it was long before they waxed old.

Of the way to drive away Serpents. Of their poylon and bitings

A certain and fure way to care those who either have been possoned, invenomed. or bitten by them.

pents.

Suffumigations O expell and drive farre away any venomous Creatures, we use to make fumigations of the Suffumigations to expell and drive large way and the horns and hoofs of fuch beafts as be cloven footed: ikewife of Bay-leaves and berries, Calamint, Water-creffes, and the aftes of the Pine-tree The leaves of Vitex, Bitumen, Cafforeim, Melambium, Gouss-horns, Cardamomum, Galbanin, Propolic. The leaves of Vitex, Bitumen, Captoreum, Actualists, Constant, Constant, Calonium, Propole, which may be called Bee glew, the herb called Horstrange, Panax, Opopanan, Fleabane, the shavings or serapings of the Cypresse or Cedar tree being steeped in Oyl, the Jet-Rone, Sagadimum, the herb or terapings of the Cyprene or County the things that have a firong or vehement ill favour, being the orther called Poley, Fern, and all other things that have a firong or vehement ill favour, being the orther called Poley. called rotes, rern, and all other their vapour chale away venomous beafts. For whereas all venocoals for a fumigation, do with their vapores of their bodies very straight and narrow, they are very mous Creatures have the passages or pores of their bodies very straight and narrow, they are very easily filled and stuffed, and are quickly stopped and suffocated by such like sents and smells. carry med and numer, and are futerh down an excellent fume after this manner. Takeof Gelbe. num, of Sandrachd, Butter, and of Goats-fat, of every one alike much, make them into Pills. and use them for a fumigation. Nicarder in Theriacie setteth down some for the same intentions. in these Verses.

> Cerulnique eravi cornu midore fugabit : El fic cum accendens Gagate quandoque lapillum, Quem consumentis non exedit impetus ignis : Multifidam filicem orepitantibu injice flammie, Aut imas viridie libanotidos accipe fibras. Tantundemque acrie nasturci : bie junge duobus Æquali caprea jam jagum pondere cornu, In English thus

By Hart-born fume do Serpents Slide away When Stone Gagates burning's put thereto! Which heat of five doth not clean destroy: Then int' those flames cast many-leaved Fern also. Of green hogs-fennel, take the lowest branches, Of Nofewort (barp, fo much: then to them joyn A like proportion of Roes born in weight and kantches,

Aut exiccantem nares cerebrumque nicelan. Interdum Sulphur, fædum quandoque Blimen. Tit Sumpta aqualt pendantur fingula parte. Praterea graveolens candentibus indita runia Galbana, & ignitum faciens urtice delerem. Dentatifque cedrum maxillis fetile lienum. Omnibus invisum Serpensibus effat odorem

Or else Nigella, drying nose and brain, Or Brimstone, called filiby Sulpbure, So all be equall in weight and parts to oure. Besides, Galbanum rank, laid on burning mal, Or nettles, which do cause and ry pain, And Codar out; all barn'd bout Serpenti boles. Them overcome, and make them flie amain.

The breath or vapour that issueth from Serpents is so pestilent, that it killeth all young chickins, as Columella faith; and for preventing of this mischief, it is good to burn Harts-horn, Womens hair, or Galbanum.

Vis & mirificos cautus perdiscere odores, Accensis quibus arcetur teterrima Serpens_ Aut Styracemuras, aut atri vulturis alam, Vel Nepetam aut frondem rigida stirpemque mytica. In English thus: If thou wouldst learn what edours for thy skill

Were best to scare the Serrent sterce away, Burn Styram, or black Vultures winged quill, Or Neppe, green leaves, or stock of Tamarick affay

And Pliny and Sextus agreeing with him, do fay; that if you burn the feathers of a Value, all Serpents will quickly avoid the strong sent thereof. There is a certain River in the Commerce of Media and Paonia, (as Ariffotle teftifieth) wherein there is a stone found, with whose sume Sepents are chafed away: whose property is such, that if any man cast water on it, it will burn, and burn. ing, if with any Fan, you go about to make it to flame, it is ftraightway quenched, and thus being extinguished, it sendeth forth a savour stronger then any Brimstone. And to this subkribeth Nicander in these words.

Vel tu Threicium flamma Juccende lapillum, Quilicet irriguis merfus tamen ardet in undie. Expressaque Statim restinguitur unclus oliva,

Plane quem fluttifont mittant de littere Ponts, Quistude vulgus, thi vescentes carne magisti Pafcendi pecorie fua poft armenta fequentur.

In English thus; Or take the Thracian Stone, which fet en fire Will burn in water, yet quenched is with Oyl. This cast from Pontus sbore, Heard-men defire, The better to feed their flocks, and Serpents foyle.

Of Serpents in General.

The powder of a Cedar tree, putteth to flight venomous Serpents, as Virgil in the third of his Georgicke witneffeth.

Disce & odoratum stabulis accendere Cedrum. Galbaneoque agitare graves nidore chelvdros. Which may be Englished thus ; Learn bom of Gedar, fire in thy folds to make, And with Galbanums favour, put to flight the Snake.

Things that are strewed or laid under us, both in our houses and in high-wayes or beds, will like. Of such things Things that are never or take any enormous creatures: as for example; Southernwood, Dittander, Fleaas are laid unwiledefend and keep us from venomous creatures: as for example; Southernwood, Dittander, Fleaas are laid under us, that wiledetend and neep us north regia, Sage, Nightshade, S. Johns wort, called of some Fuga demo- der us, that bane, Calamint, Gentian, Hastula regia, Sage, Nightshade, S. Johns wort, called of some Fuga demo- will expel Serbane, Calamin, Origan, wilde Rue, wilde Thyme, Bay-leaves, the shavings or tops of the Cypenis, ores or Cedar-tree, Gardamomum, Penyroyal, Wormwood, Mugwort, Lyfmachia, called in English nose-strife, and Rosemary. And if we cannot lie upon such a bed ;

Tunciunta virides sinuosi vorticis alvees Amnicolam nepetam per obefos collige ripas. Aut tibi cafta falix, pulchro que flore renidet. Prabeat, instrata securum fronde grabatum. Sic quoque montanum polium, cujus grave fpirans Horres odor, nomenque (uum qua debet echidna Huba & ab Euxina que fertur origanus urbe. Quecunque illarum decerpitur obvia, prodeft. Quin etiam multo per aprica cacumina flore

In English thus Then by the winding banks of crooked fireams The Water-nep take up, which under-foot is tread. Or the chaft Ofter , whose fair flower bath beams Andleaves, secure from Serpents make thy bed. The Mountain Poley , whofe firing fmelling breath The nakes abbor & that which doth the bydra name, The Origan which cometh from Euxinus earth. Doprofit all gainft Serpent, if you bear the fame.

Ridens abrotonm, pecorique ingrata petitum Pabula ferpyllum, molli quod pafcitur borto. Praftat item exiguam circumlustrare conyzams Urticeasque comas, & spinosas anagyros; Sic & punicea fellis ex arbore ramis. Regalisque amplis licet hast a frondibus uti. Accipe item innocuo medicantem frigore frumum, Atque invifa pigris Scyra prima astate bubulcis. Nicander

The smiling Southernwood, which groweth on tops of Wilde Marjoram, to beafts abborred food. Conyza frewed, the baunt of Serpents Spills, The Nettle-crops thorny Anagres flay their mood, So do Pomegranate branches out from tree ; And the broad leaves of Kingly Hafta ufe Strume bealing strumes in barmle's cold I fee. And Scyra, which in Summer Neatheards do refule.

Inlike fort, to fprinckle the place with water, where in Sal Anamoniaoum is diffolved, driveth away Serpents, as Avicen affirmerh.

liany one anoint himself either with Dears-sewet, the fat of Elephants or Lions, Serpents wil shun Of Unguents If any one anoint himself either with Dears-lewet, the fat of Elephants or Lions, Serpents wil multiperform and there be some, (as Pliny faith) that for fear of Serpents, do anoint their bodies born about us, with the feeds of Juniper. The juyce of the black Vine extracted from the root, and anointed from which on the body, performeth the like. For preservation from Serpents, Nicander compoundeth this Berpents will ointment. Take two Vipers about the end of Spring time, Deer-sewet thirty drams, Vin run away, tent rolat thirty fix drams, crude Oyl of Olives as much, commix them with nine ounces of Wax, boil the Serpents till the flesh fall from the bones, which you must cast away because they are

They that will yet be more affured, let them anoint their bodies with a thin cerate, made of Wax, Oylof Roles, a little Galbanum, fome powder of Harts-horn, or elfe Cummin-feed of Ætbiopia, &c. Actius. If a man carry about him the tooth of a Stag, or thole small bones which are found in his heart, he shall be secured from Serpents. If any one do bear about him wilde Bugloss, or the root of the wilde Carot, he cannot be wounded of any Serpents, Grevinus is of the minde, that the Jet-stone, belide other manifest qualities, hath yet this as peculiar to it felf, that he which carryeth it about with him, need neither to fear Serpents, nor any other poylons,

Now for venomous beafts, which are found in any houses, the best way is to pour scalding water into their dens and lurking holes. And if any man (conftrained by necessity) can finde no other place to fleep, but fuch a one as where Salamanders, the Spiders called Phalangia, or the like Serpente do abound, it is good to stop the holes and corners with Garlick beaten with water, or some of those herbs which before we have spoken of. But yet men now adays hold it the safest course, to pour unquenched Lime fprinkled with water into their dens and fecret corners.

Asthey that are bitten by a mad Dog, foall such persons be wounded by venomous creatures, are in exceeding great danger, unless at the first they receive speedy help and succour: The safest way therefore to cure the poyfon, is by attractives, which draw from the more inward parts to the furface, and not to make too much post-hast in closing up the wound. But if any one hath swallowed down, and taken inward any poyson, the hest way is (as Diagorides writeth) to vomit often, but if any house the same has any poyson, the hest way is (as Diagorides writeth) to vomit often, but if any be wounded by biting, then it is best to use scarification, and to fasten Cupping glasses upon the place affected, to draw out the poylon. Some use to suck the venom out, and others to cut off and dismember the part. And this is to be observed, that if any one will undertake to suck out the tenom the name of the part. renom, the party that attempteth it must not be fasting, and besides, he must wash his mouth with

fome Wine, and after that, holding a little Oyl in his mouth, to fuck the part, and to fpit it prefome Wine, and after that, holding slaffes be applyed, the part must first be fomented with a Spunge, fently forth. And before Cupping-glasses be applyed, the part must first be fomented with a Spunge. fently tortin. And belote the venomous matter may the more speedily be drawn out from the more then scarified deeply, that the venomous matter may the more speedily be drawn out from the more then Icarinea acepty, that the tree to the flesh round in a compass, doth more good then any fear-inward parts; and yet cutting off the flesh round in a compass, doth more good then any fear-inward parts; fication.

ation.
But if the place will admit no fection or incision, then cupping-glasses, with deep scarification, But it the place will added be used : for by attraction of the bloud, and other humors with winds with much flame, must needs be used : for by attraction of the bloud, and other humors with winds. with much name, munt needs be deceffity follow. And Actiu in his 13. Book and tenth Chapter, council, the poylon it felf must of necessity follow. And Actiu in his 13. Book and tenth Chapter, council, the poylon it felf must of necessity follows. neis, the poyion it ien man be kept from fleep, and fo fit fill, until he finde fome ceasing or releafelleth that the tick perion be kept it on the member which is envenomed, ought to be be bound round about, fing from his pain. Besides, the member which is envenomed, ought to be be bound round about, fing from his pain. Deliues, the transfer of the more noble and principal that the poylon may not too eafily convey it felf, and penetrate into the more noble and principal that the poylon may not too eafily convey it felf, and penetrate into the more noble and principal that the poylon may not too sain. And in this manner having applyed your Ligature, you must by parts, as the heart, liver, or brain. And in this manner having applyed your Ligature, you must by the advice of Fumanelum set on your Cupping glasses, and they being removed, apply the herb Cala. the advice or Fumaneum size on your Chapter form of the root of Mugwort in powder, of the best mint upon the place, and to give the patient form of the root of Mugwort in powder, of the best mint upon the place, and to give the page the heavy and for this inverse Russics P. mint upon the place, and fuch Cordials as do corroborate the heart; and for this intent, Buglofs, Borage, Balm, and any of their flowers are much commended.

A Dove or Pigeon being divided in the midft, and applyed hot to the place affected, attraction A Dove or riggon being at the fame effect and vertue have other living creatures, as namely, poyton to it ien, and it is it Hens and Chickens, young stus, and for being as yet hot and warm, they draw out the poplon, after the Cupping-glaffes be removed, for being as yet hot and warm, they draw out the poplon, anter the Cupping-Busines of the any one for love or money can be found, that will or dare and mitigate pain. But if neither any one for love or money can be found, that will or dare fuck out the venom, and that no Cupping-glass can be provided, then it is best that the patient do fup of Mutton, Veal, or Goofe broth, and to provoke vomiting. Yet they that will more effects. ally and speedily give help, use to kill a Goat, and taking out the entrails, with the warm dung there in found, forthwith binde unto the place.

The learned Physician Matthiolus, in his Comment upon Dioscorides, faith; that to avoid the danger that cometh by fucking out the venom, men now adays use to apply the fundament of some Cock or Hene or other Birds after the feathers are puld off, to the wounded place, and the firther ing, to apply another in the same order, and so another and another, until the whole venomous matter be clean driven away : whereof one may be certainly affured, if the last Hen or Bird 6 applyed, do not die. Avicen the Arabian faith , that the Physicians of Egypt, ('in which Countree there be infinite ftore of venomous Beafts) do haften to burn the part with fire, as the fafeft and furest remedy, when any one is this way endangered: For fire not only expelleth poysons, but many other grievances. But the way how they used to burn with fire, was divers in the easts: for fometimes they used to sear the place with a hot Iron, and other whiles with a cord or match being fired, and fometimes scalding Oyl, and many other devises they had with burning medicaments to finish this cure, as faith Hieron. Mercurialis in his first book De Morb. Venenatis writeth, and John Tagault, Infittut. Chirurg. lib. 2. faith, that the wound must first be seared with a hot Iron (if the place can endure it) or else some caustick and vehement corroding medicine must be used: for all fuch wounds are for the most part deadly, and do bring present death, if speedy remedy be not given: and therefore, according to Hipporrates counsel, to extream griefs, extream remedies multiple applyed; so that sometimes the safest ways to take or cut off that member, which lath either been bitten or wounded.

Neither am I ignorant (faith Dioscorides) what the Egyptians do in these cases : For when they rup their Corn in Harvest time, they have ready at hand prepared, a pot with pitch in it, and a stringor bandlhanging at it; for at that time of the year they are most afraid of Serpents, which then thiely do hide themselves in dark holes, and caves of the earth, and under thick clots and turs, for Egy aboundeth with such venomous and poysonful creatures. When as therefore they have wounded ither the foot or any other part, they that are present, do put the string into the pot of pitch, and binding the place, they fall to cutting it with some instrument round in compass as the firing styed, after this done, they pour in of the pitch a fufficient quantity, then untying and loofing the band,

they laftly anount it with Garlick and Onions. A certain Countryman being bitten of a Serpent, perceived by and by his foot to fwell, and by little and little the force of the poyfon to swell up higher, and nearer to the heart, the Castle of life : who being taught and inftructed of an old woman, to bury his foot under the earth, and to cut a a Hen into two parts to apply to the wound, and to the Hen she wished him to lay a live Frog, who continually fucking the bloud from the Hens flesh, might by this means at length attrict and draw all the poyfon into it felf. So when he had held his foot a whole night covered and buryed under the earth, and finding no abatement, but rather an increase of his tormenting pain; at length by the advise and direction of a certain Noble Matron, he drank a good draught of Theriace and Hong tempered in Ale, and so after a few hours fell on a great and continual vomiting, by which means he was perfectly freed from the pains of the upper parts of his body, his feet notwithstanding cuminning in their former swelling: which was also taken clean away, only by drinking the milk of a black Goat, fo much in quantity at a time as one Egge-shell would contain, his foot in the men space being held or plunged in a sufficient quantity of the same milk. From which there is and ran a foul flinking glutinous and fnivelly matter, and this he was admonished to dobysto. tain Prieft. But yet afterwards by chance, washing himself in a hot sunny day in a certain Ring,

and fitting upon the bank, his teet hanging down into the water, and he falling fast affeep. (he and litting appearance in the formation of the plainty perceived the water that was neer, on all fides to be filthy, flained and polluted with much flinking matter, and as it were dreggy, refuse and securency, and from that time forwards, he remained well and lufty, and as sound as a Bell.

Another time a Maid being bitten of a Serpent, laid presently upon the wound some fresh Cheese made of the milk of a white Goat, and powring or sprinkling her foot with the milk of the same Gost, as a defendative for that part, was by this means restored to her former health, as a certain

learned man teftified in his Letters written to Gefner.

Vegetime affirmeth, that if any living creature be bitten and wounded of venomous Beafts, the place which is hurt, must first of all be suffumigated with Hens Egge-shels burnt, which first ought to be infuled in Vinegar, with a little Harts-horn, or Galbanum. After fomentation, the place mult be fearified, and the blond must be let out, or else the place must be seared with a hot Iron, so Bras the venom fretcheth. And shis care must be had, that the Cauter be never applyed and laid eiber above the joynts, or finewy parts at any time, for the finews or joints being feared and burnt. there must of necessity a continual weakness and debility follow. Therefore great diligence must beused, that neither a little above, nor a little beneath the nerves and joynts, we lay any Cauteriang medicine, yea, although necessity biddeth us. But it is also requisite that every one thus wounded, do gently and easily provoke sweating with warm clothes cast upon him, and afterwards to walk up and down, and to take Barley-meal in his meat, with some leaves of the Ash-tree, and the white Vine added to it. And to the wound it is good to apply Attick Honey, or Cummin heated and parched, and fo mixed with old Wine. Some use to mix new Hogs dung and Article Hony tempeted together with Wine, and so being warmed, to apply it as a Cataplasm, adding to it some urine

I have faid before, that young Chickens being diffected or cut in pieces when they are warm, ought to be laid to the stinged part; and some there be that yeeld this reason why they should be good for this purpose, because (say they) there is a natural antipathy betwixt them, and venomous creatures. But this reason is reasonicis, and I think rather, that Hens or young Birds, being of a very hot nature and complexion, do eafily concoct and digest notable poylon, and their stomickedo confirme most dry and hard feeds, which the strongest man living cannot do: which may cally also be proved by this argument, that many times by their ravening, they swallow down fand and little flones, which they do easily diffolve, and their crops very foon discharge, without any offencetothem at all. And therefore the spirits of an inwenomed person, being helped and refreshed with the lively and strong natural heat of these sowls thus applyed, and receiving and acquiring french from the part wounded, and to hastily leaping out as it were, and quickly sparkling forth, they do expel, thut and draw out the poyfon.

Now, after we have described the general method of curing this mischevious evil, we will now defend to particular remedies, observing ever this rule and order, that first I will speak of such mens as are topical, or fuch as are outwardly applyed; and next of fuch as be taken inwardly, and inboth of them I will first describe compound, before I speak of simple medicaments. This one Lesson you must carry with you, that many remedies are prescribed and set down, which be not only good for the bitings of Serpents, but also for the bitings and stingings of all other venomous creatures, as namely, of Scorpions, Tarantulaes, Spiders, and the like. But yet, fith these do properly respect Serpents, I will in this place set them down : beginning first (according to my promile) with such compounded medicines, as are applyed outwardly for the help against the stinging of Serpents.

Thrista Andromachi applyed Plaister-wife, is natable for this purpose. So there be other vehement strong Plaisters, whose vertue is to attract, expel, and discuss venom, of which are those which are made of Salt, Niter, Mustard-feed, and Rosemary-seeds, Dittany, or Dittander, and the root of Chamzleon : and this that followeth is of fingular vertue. Take of the fcum, froth, or spume of Silver one pound, Ceruse, and of the best Turpentine, of either as much as of the former, old Oyl three pounds, Wax fix ounces, Ammoniacum Thymiama, four ounces, and of Galbanum as much: by the Ceruse, the scum of Silver, and the Oyl so long, that they will not cleave unto the bands, then melting the other ingredients, incorporate them all together, and use them when need

There is an Emplaister fathered upon one Epigonus, and bearing his name : for this Epigonus being in close Prison, and condemned to die, for revealing this Medicine had his Pardon granted him, and was freely discharged, because he therewith healed the daughter of the Emperour Mar-cw: for being forcly wounded by a Serpent inher breast, and all other Physicians despairing of help, fet with this she was recovered. It is also good for all new and old Ulcers, and for such as are either bitten by any kinde of venomous creeping Worms and Serpents. Take of Squamma eris, (which is the scales and offal of Brase, blown from it in melting) of Anmoniacum, Aloes braita, Verdigreale, of Es ustum, of Frankincense, Sal ammoniacum, Aristolochia rotunda, of every one half a conce feed. one half an ounce, Turnep-feeds three scruples, of the root of Dragon-wort half an ounce, seeds of Management and Out share ounces. of Mugwort nine feruples, pure Wax five pound, of Celephenia one pound, old Oyl three ounces, harp Vinegar half a spoonful, Mustard-seed three scruples, Spodium nine scruples, Stone-allum and Openax, of either half an ounce: Infuse the metalline ingredients for three days space in Vinegar.

Vinegar, and beat and powder them together, melting those that are to be melted, then sprinkle Vinegar, and near and powder them being throughly wrought and made up, according to the form of an Emplaifter, use them where necessity requireth.

rm oran Emplanter, the them whitean, prescribeth an experimented, and (as he calleth it) a finine Antonius rumaneum, a late raystem, or the biting of any venomous Beafts and Serpents whether it be received inwardly by drinking it down, or anointed outwardly upon the body and whether it de received inwards of Oyl of Olives one pound, the flowers and the leaves of the herb this is it that followers. Take to open for the space of three hours, and frain them, then boyl again called S. Johnswort bruised, boyl them for the space of three hours, and frain them then boyl again called S. John more bruned, boyland the fame herb and frain them hard, and do so again the third time. other trein nowers and reaves of Gentian and Tormentil, of either one ounce, boyl and frain them as you did before, and referve this Oyl for your ufe."

and de Detore, and refer ve tuis Oylors apon Diofcorides, doth exceedingly commend Oylors Cor-Andreas Matinious in ins Commentants upon a proper outwardly, it is (as he affirmeth) a fingular remedy, pions, because being anointed upon the pulses outwardly, it is (as he affirmeth) a fingular remedy, pions, because being any not only against any poyson taken inwardly into the body by the mouth, but for the bitings and not only against any possible of the way to prepare and make it, he described at large, in his Preface upon the fixt Book of Diofeorides, which I think needles here to describe to at large, in this territore if any one be defirous to know the composition of it; let him read Matthiolis in the place before cited. Unquenched Lime mixed with Hony and Oyl and applyed to the place the thickness of a cerote, is good against the wounds that come by any venomous Besse

Now I think it meet to fet down those simple medicaments which are outwardly to be applied either by laying on, or by anointing, against the sting and venomous biting of Serpents. It is best first to soment the fore place with hot Vinegar, wherein Catamint hath been boyled, and in stead of Vinegar, one may take Salt-water, or Southernwood, Maidenhair and Garlick, either in drink meat, or to be used as an Ointment. The root of Aram, and Astrologe, and the leaves of the rue Daffadil, and Oyl of Balm, is most effectual : also Bdellium, and the root either of the white or black Beet, is good against the bitings of Serpents.

Betony, Coleworts, especially the wilde Coleworts, Calamint, the leaves of the wilde Figure. Centory, Onions, Germander, Chamæleon, the herb called Fleabane, wilde Carrets, Rocket, Heath, Fennil, Figs, Winter Cherries, Enula Campana, Barly-meal, the Day-lilly, Hylop, the Flower-dluce. root, Horehound, Balm, Water-creffes, Bafil, Origan, Plantine, Leeks, Turneps, Madder, Rue, Veven, Mustard-seed, Scabious, and Saint Johnswort, all these plants are greatly praised among the Writers of Physick, for the mischiefs abovesaid.

Pliny is of opinion, that the bowels or entrails of Serpents themselves, being applied, will lurely cure the wounds of all other Serpents, although they feem incurable. A live Serpent being cought if it be bruifed, beaten and stamped in water, and the hurt place formented therewith, will affuredly help and do much eafe.

> Que nocuit Serpens, fertur caput illimapie Vulneribu jungi, fanat que fauciat ipfa, Ut Lariffea curatus Telephus hofta. Which may be thus thus Englished; What Serpent burteth, Men fay by long experience. His head applyed doth cure : for where the wound. The help is also made, as in Telephus sense, Harm'd by Lariffus fpear, by it was cured found.

And Guil. Varignana saith, divide or cut a Serpent, and say it upon the place, and it will mitigate the anguish and pain. The seed of Thraspi and of Tithimal (which is a kinde of spurge) is greatly used for this: Aut Tubimalius atrox, vulnus que tuta perungat. Some besides these, do put the root of black Hellebore into the wound, because it draweth out the poyson, as I by mine own experience ean testifie, faith Matthiolus.

There be also fundry Antidotes and Preservatives which are taken inwardly, that are very effechual against the bitings of Serpents and venomous beasts, as namely that, which is called Therises Andromachi, or Mithridate, and the like compositions. Galen in his Book De Theriaca ad Pilanen, preterreth Theriaca Andromachi before all other medicines either simple or compound, for virulent wounds; because it performeth that effect for which it is ministred. For it was never to the state of the sta that ever any one perished of any venomous hurt or biting, who without any delay forthwith drain this medicine: and if any man had taken it before he received any fuch dangerous burt, if he were fet upon and affailed by any poyfonous creature, it hath not lightly been heard that he hath dyd of the same. There be many Antidotes described by the Ancients, which they set down to be admirble for thesepassions: As for example, that which Avisen tearmeth Theriaca mirabilia, whose compo fition is as followeth. Take of Opium and of Myrrhe, of either of them a dram, Pepper one dram and a half, the root of Arifolochia longa and rotunda, of each of them three drams, Winems drams; make them up with Hony and Rocket water, fo much as is sufficient for an Electuary: the quantity to give, is four scruples, relented in some fit and convenient decoction.

King Antiochim, furnamed Magnus, had a kinde of Theriaca which he used against all poysons, which is described of Pliny in his 20. Book and last chapter in this wife. Take of wilde Thyme, Opopanan, and the herb called Gromel, of each a like much, two drams, Trifolie one dram, of the feeds of Dill, Pennil, Smallage, Anife, and Amees, of every one alike fix drams, of the meal of Orebus twelve drams; all these being powned and finely searsed, must with Wine a sufficient, quantity, be made into Trochifces, whereof every one must weigh one dram, give thereof one dram at a time in a draught of Wine. There is another Antidote and prefervative against any poylon, described by Paulus Aegi-Wine the unto this, which is thus: Take of Bryony, Openana, of the root of Iris Illinica, and of the root of Rolemary, and of Ginger, of each of these three drams, of Aristologia five drams, of the best Turpentine, of wilde Rue, of each three drams, of the meal of Orobin two drams; make them into Trochifees with Wine, every one weighing one fecuple and a half, or two feruples

Of Serpents in General.

Galen in his second Book De antidorie, chapter 49. discourseth of a certain Theriacal medicament, called Zapyria antidotus, (I o taking the name of one Zopyria) which was notable against all poysons, and bicings of venomous creeping creatures. This Zopyrus in his Letters written unto Mitbridater. follicited him very much, that he would make some experiment of his Antidote: which as he put him in minde he might easily do, by causing any one that was already condemned to die, to drink down fome poyfon aforehand, and then to take the Antidote:or else to receive the Antidote, and after that to drink some poyson. And put him in remembrance, to try it also in thosethat were wounded any manner of way by Serpents, or those that were hurt by Arrows, or Darts, anointed or poysoned by any destroying venom: So all things being dispatched according to his præmonition, the Man (notwithstanding the strength of the poyson) was preserved safe and sound by this alexipharmati-

Mathidus in his Preface upon the fixth Book of Dioscorides, entreating of Antidotes and preservatives from poylon, faith; that at length, after long study and travail he had found out an Antidote whose vertue was wonderful and worthy admiration; and it is a certain quintessence extracted from many simples, which he setteth down in the same place. He saith it is of such force and efficacie, that the quantity of sour drams being taken either by it self, or with the like quantity of some sweet feating Wine, or elle with some distilled water, which hath some natural property to strengthen the beart; if that any person hath either been wounded or strucken of any venomous living thing, and that the patients life be therewith in danger, fo that he hath loft the use of his tongue, seeing, and for the most part all his other fenses, yet for all that, by taking this his Quinteffence, it will recover and raile him as it were out of a dead fleep, from fickness to health, to the great aftorishe ment and admiration of the standers by. They that desire to know the composition of this rare preservative, let them read it in the Author himself, for it is too long and tedious to describe it

There be befides these compounds, many simple medicines, which being taken inwardly, do perform the same effect, as namely the Thistle, whereupon Serenus hath these verses following:

> Cardum & nondum dellis fullonibus aptus Ex illo radix tepido potatur in amni. That is to fay; The root of Teafil young, for Fullers yet unfit, Drunk in warm water, venom out doth fpit.

That Thiftle which Qy. Serenus here understandeth, is properly that plant which of the Greeks is called Scalymos. Yet it is taken sometimes for other prickly plants of the same kinde, as for both the Chameleons, Diplacos, or Labrum Veneria, Spina alba, Epngium, and some other. But Dioscorides attributeth the chiefest vertue against poysons, to the Thistle called Chameleon albus, and to the Seathifle called Eryngium marinum, which fome call Sea-hul, or Hulver: for in his third book and ninth thapter, entreating of Chameleon albue, he faith thus; The root of it taken with Wine inwardly, is a good as Treacle against any venom: and in the 21 chapter of the same Book, Eryngium, is (faith he) taken to good purpose with some Wine, against the biting of venomous creatures, or any poyfon inwardly taken. And the same Serenw adscribeth to the same vertue to the Harts curd or rennet,

> Cervino ex fatu commixta coagula vino Sumantur, que res membru agit atra venena. In English thus; Wine mist with Rennet taken from a Hart, So drunk, doth venom from the members part.

He meaneth a young Hart, being killed in the Dams belly, as Pliny affirmeth also the same in his 8. Book and 30. chapter in these words; The chiefest remedy against the biting of Serpents, is made of the Congulum of a Fawn; kill'd and cut out of the belly of his Dam. Congulum, is nothing elle but that part in the belly which is used to thicken the Milk.

Qu Serenm.

Proderit & caulem cum vino haurire fambuci. Which may be Englished thus;

In drink, the powder of an Elder-ftalk . Gainft poifon profiteth, as some men talk.

Qu. Serenm.

That vertue which Serens here giveth to the falk of Dwarf Elder (for that is meant in this That vertue which serems here give the to the root in his fourth Book, and Pliny to the leave. place) the same enect Disjourner attention these foresaid affects, and by good reason, for the seven. The herb called Betony is excellent against these foresaid affects, and therefore to compare the seven and the seven The herb called Betony is excellent against their excess of coldness, and therefore to overtome and resist part of poyfons do kill through their excess of coldness, and therefore to overtome and resist part of poyfons do kill through their excess of coldness, and therefore to overtome and resist eit part of poylons do kill till ought which natural and lively heat is firred up and quickned, and fo the poylon hindred from growing thick together, and from coagulation.

ne poyton ningreu from growing thick edicines are profitable which do extenuate, as all those do Again, all men do agree, that those medicines are profitable which do extenuate, as all those do Again, all men uo agree, that those ine, and Betony is of this quality, and therefore being taken which have a property to provoke urine, and Betony is of this quality, and therefore being taken which nave a property to provoke utility, and that not only in the bitings of Men and with Wine, it must needs do good in venomous bitings, and that not only in the bitings of Men and Apes, but in Serpents also. Radish also hath the same quality, being taken with Vinegar and Wa.

ter boiled together, @ elfe outwardly applyed, as Serenu affirmeth.

Sive bomo, seu similis turpissima bestia nobie Vulnera dente dedit, virus simul intulit atrum, Vetonicam ex duro prodest affumere Bacche.

If Man, or Ape (a filtby beaff most like to 16) By biting wound, and therein poyfon thrust, Then Betony in hard Wine Steeped long,

Plec non & raphani cortex decolla medetur Si trita admorfis fuerit circumlita membris.

In English thus;

Or rinde of Radift fed as foft as pap, Do heal, applyed to the members fing.

There be certain herbs and simples, as wilde Lettice, Vervin, the root called Rhubarb, Against Oyl of Oliander, and the leaves of the same, the seeds of Peony, with a great number a link before described, that being taken either inwardly or outwardly in juyce or powder, do cure porson. yea though it be received by hurt from envenomed arrows, fhafts, or other warlike engines and weapons: for the Arabians, Indians, the Galls (now tearmed French-men) and Sythian , were wont to poyfon their arrows, as Paulm Orofins in his third Book testifieth of the Indian, wherebe writeth, how Alexander the Great, in his conquering and winning of a certain City, under the government of King Ambira, loft the greatest part there of his whole Army with envenomed darts and quarrels. And Celfus in his fifth Book faith, that the ancient Galles were wont to snoint their arrows with the juyce of white Hellebore, with which they they did great michief. Plan affirmeth the same to be used of the Scythian Nation. The Scythians (faith he) do anoint their Arrow-heads with the corrupt, poylonous, and filthy stained dreggy bloud of Vipers, and with Mins bloud mixed together; fo that the wound feemeth to be incurable. And to this alludeth Quintu

> Cuspide non quisquam, longa neque cade sarifa, Fulmine non gladit, volucrie nec felle fagitta, Quam cito Vipereo potis eft affligier ichu: Quare apram dicamus opem, succosque manentes. Which may be thus Englished ; There is no Man with Spear or Launces point, Sharp edge of Sword, or swift Arrows might, To kill so soon, as Vipers force doth dint: Then sit is the aid and means that it acquite.

There is a certain kinde of people to whom it is naturally given, either by touching or facting, to cure the wounding of venomous Serpents, called P(pili, (a people of Lpbia) and Mafi, people of Irab, bordering upon the Sammites, and Æquiculanta, and those that were called by the Ancient Writers Opbiogenes, which dwelt about Hellespont, as both Pliny, Elianus, and Enus Spitus do

Callia in his tenth Book of the history which he wrote of Agathecles the Syracufan luth, that if any man were bitten of a Serpent, if either a Lybian by birth, or any Pfillas, whose body we accounted venom to Serpents, was either purposely sent for, or came that way by chance, and faw the wound but indifferently, and not very fore tormenting the Patient, that if he did hybri little of his spittle upon the biting or stroke, that presently the aking and pain would be mitiguid. But if he found the fick Patient in great and intolerable anguish and pain, he took this counter his curation, that first he would suck and draw up into his mouth a great deal of water, and the single and water his curation, the single and water his curation. risse and wath his own mouth therewith, and after this, pouring it all out of his own mouth the cup, he would give it to the poor wounded person to sup off. Lastly, if the malignity self firength of the venom had crept and spread it self very far and deep into the body, so that there was danger of death. was danger of death, then would be strip himself stark naked, and so lie and spread his boy

Of Serpents in General.

of the poylon, and give perfect cure to the man. For more confirmation hereof, Nicander Colopbonius,

is sufficient aurhority, whose verses I will here describe. Ladere : quin lasis ferre & opem reliquis.

Audivi Libycos Pfyllos, quos afpera Syriis Serpeniumque ferax pat via alit populot. Non idu inflidum diro, morfuve venenum

Non vi radicum, proprio sed corpore junto.

The people Pfylli bred in Lybia Land Net Syrtes, where all Serpents do abounds Are never flung nor bitten by that band

Which is in English thus: Unto their barm, or any bodies wound : But Straight one naked man anothers burt doth heal, No roots, but bodies vertue danger doth repeal.

Some of the Greeks have left in writing, that the Idolatrous Priests and Prelates of the God Vulcan, Some of the Lemnos, had a special vertue given them to cure those who were wounded by Serthat awer in the wind were wounded by Serpents: whereupon it is faid, that Philodetes being wounded by a Serpent before the Altar of Apollo. went thither to be remedied of his hurt. Cornelin Celfin faith flatly, that the people called Pfili had went tiltues to the people caused rous had no fuch peculiar gift in healing them that were hurt of Serpents, either by fucking or touching the foliace, but being boldly adventurous, had prefumed thereby to attempt and do that, which others of place, but being policy and the confident as to follow their example, hould be himself out of danger, and affure the other safe and free from fear of further hurt.

Golen in his book De Theriaca ad Pifonem, manifettly sheweth, that the Marfi, who lived in his days, had no fuch special quality against the poyson of Serpents, but that with their crafty dealing, and had no nutri petal quality and the common people. For faith he, those Juglers and Deceivers do neverhuat Vipers at any convenient time, but long after the prime of the year and Spring, wherein they caft their skins, when as they are weak, and have loft their frength, and are very faint then do they take them, and fo by long use and continuance, teach them, and inure themselves one to another, and bring it fo to pass, that they wil feed them with strange and unaccustomed meats to their nature; yea they will permit them to taft of flesh, and constrain them to be continually gnawing and bing of the fame, that by their fo labouring and striving, their poyson may by little and little be font, and purged out of their bellies. Besides all this, they give them a kinde of bread made of milk and flour, that by this means the holes in their teeth may be stopped; and so by this laborious course of dieting them, they bring the matter fo about, that their bitings are very weak, and do small annoyance to any that they firike at. So that the feers and lookers on, account it a thing exceeding common reason and nature, and blaze it abroad for a thiracle.

Manhialus alfo, a Physician of late days, agreeth with him in this point, affirming expresly, that the kinde of trumperies and crafty fetches are much put in practife in these times, by such bold and impulent Quackfalvers, Mountebanks, and confeners of plain Countrey people, who dare face it out, lichign and cog, that they are descended from the race and linage of Saint Paul, wherein they shew

themselves notorious lyers, &c. Thus far Matthiolis.

Serpents do sometimes creep into the mouths of them that are fast asseep, whereupon a certain Poet faith :

Non mibi tunc libeat dorfo jacuiffe per berbam, Which may be Englished thus : Then would I not upon the grafe, Lie on my back where Serpents pafs.

For if a man fleep open mouthed, they flily convey themselves in, and winde and roll them round in compals, so taking up their lodging in the flomach, and then is the poor wretched man miserably and pitifully tormented; his life is more bitter then death, neither feeleth he any release or mitigation of his pain, unless it be by feeding this his unwelcome guest in his guest-chamber, with good store of milk, and such other meats as Serpents best like of. The only remedy against this mischief, is to at good ftore of Garlick, as Erafme in his Dial. De Amicitia faith. Cardan faith, how that it was reported for a certain, that a Viper entring into a Mans mouth being afleep and gaping with his mouth, the venomous Worm was expelled only with burning of Leather, and to receiving the flinking fume at his mouth, the Viper not enduring it, he escaped with life. But of this more in our dis-

A tertain man called Ciffin , heing very devout in the fervice, and much addicted to the worship of the God called Serapis, being treacherously wound in and intrapped, by the crafty wiliness of a certain woman, which first he loved and afterward marryed, when by her means he had eaten some Serpentsegges, he was miserably vexed, and torn and rent with disquiet and torment through all his body, forthat he feemed to be in great hazard of prefent death. Whereupon, forthwith repairing and All this medipraying heartily to this his God, for his help and deliverance, he received answer, that he must go and cinal description on of Servence by a live Lamprey, and thrust his hand into the vessel or place where it was kept and preserved; on of Serpents was written by the teeth; and at langth when County and the Lamprey caught fast hold on his hand, biting hardly, and holding fast by the teeth; and at langth when County and holding fast by the teeth; and at langth when County and holding fast by the teeth; and at langth when County and the langth when the langth by the teeth; and at length, when the was pulled from her fast hold, the sickness and grievous tor- bam Doctor in Thus far Phylick. ment of his body was plucked away, and he freely delivered from that threatning danger. Thus far Phylick,

natural uses of them, and thut up all in Moralities, and in fundry ways to take them.

natural uses of enem, and inut up an in Modalities, and in their warlike preparations and Arms, did
There were certain Amazons, as Pierius noteth, that in their warlike preparations and Arms, did
use the skins of Serpents. And to the intent, that this may not seem strange, the Tragladies did eat ule the skins of Serpents. And they lived in Caves in fread of Houses, and their voyce was not a figni-Serpents and Lyzards, for they nived in Caves in the day of the caules, Serpents are very ficant voyce, but a kinde of ferietching, like gnashing. And for these causes, Serpents are very much afraid of any one of this Nation. Likewise certain of the Candeans were called Ophiopagi, much arraid or any one of the people of Arabia eat Snakes. But in India, Ethiopia, that is, Baters of Serpents; and out by Jambolus, there are Serpents which are harmles, and their and an Island in the Ocean, found out by Jambolus, there are Serpents which are harmles, and their and an manu in the stand pleasant to be eaten : So are there in Macinum, a Province of Asia. In Manzi nein very iweet and pleasant, they fell the flesh of Serpents in open Markets. These Serpents are in the upper India, and Garaia, they sell the nein of serpents in open wanters. Indie Serpents are called Juana, and the common people are forbidden to eat them, because they are very destate, even as Pheasants, Partridges and Peacocks are in France. Yet is there but one way to dress them which is, to roul them in Lard, and so to see the them. For first they bowed them, then wash them which is, to roul them in Lard, and so to see the them. which is, to rour them in Lata, and them into a pot no higger then to receive their quantity, and fold them up together round, putting them into a pot no higger then to receive their quantity; and roid them they cast Pepper with water and so seethe them upon wood and coals that will not smook.

With this Lard there is made a broth sweeter then any Nectar, which they use in many banques of

But for the taking of Serpents, I will yet add one or two more experiments, wherein the Ancients revenged the mielves upon these irreconcileable enemies of Mankinde. They didule to stine to the earth a deep pot, whereinto all venomous creatures would gather and hide themselves, then came they suddenly and stopped the mouth of that vessel, whereby they inclosed all that were taken, and so making a great fire, cast the said pot of venomous Serpents into the same, which combined them all. Otherwise they took a living Serpent, and digged in the earth a deep Well or pit so flow, as nothing at the bottom could climbe up to the top thereof, into this pit they would cast this Sernothing at the bottom could climbe up to the top thereof, into this pit they would cast this Sernothing at the bottom could climbe up to the top thereof, into this pit they would cast this Sernothing at the bottom could climbe up to the top thereof. pent, and with her a brand of fire, by means whereof the enclosed Serpent would fall a hiffing for her life, at the hearing whereof, her fellows of the same kinde, were thereby easily invited to come at her call to give her relief, (as we have thewed elfewhere) who finding the notic inthe bottom of the pit, do flide down of their own accord, whereby they likewife intrap themselves in the same pit of destruction.

But the Juglers or Quack-falvers take them by another course, for they have a staffe six at one end like a pair of tongs, those stand open by a pin, now when they see a Serpent, Viper, Addror Snake, they fet them upon the neck neer the head, and pulling forth the pin, the Serpent is inevitably taken, and by them loofed into a prepared veffel, in which they keep her, and give bermat. It is reported, that if a Serpent be ftrucken with a Reed, the ftandeth ftill at the first blow, as if the were aftonished, and so gathereth herself together; but if the be fo ftrucken the second or thirdrine, as one delivered from her astonishment and fear, the recollecteth her wits and strength, and flidth away. The like observation unto this, is that of the Ancients, that a Serpent cannot be drawn out of her den by the right hand, but by the left, for they fay, if one lay hold on her tail by the right hand, the will either flide farther into the earth from him, or elfe fuffer herself to be pulled in piece, never turning again, and therefore faith mine Author, Non cedit trabents, sed elabitur fugient, action abrumpitur, the yeeldeth not to him that draweth her, but flideth away, flying from him, or ele fulfereth herself to be pulled in pieces in the combate.

The fundry Hieroglyphicks, statues, figures, Images, and other moral observations about Serpent, are next here to be expressed, which the Ancients in their Temples, Shields, Banners, Theatres, and publique places had erected for their honours and dignity. And first of all, in the Temple of Dibbit, near the Oracle, there was placed the Serpent which provoked Apollo to fight with him, wherein it was by him flain. And the Hermopolitans, did referve the Image of Typhon, in a Sea-horse, whereupon fat fighting a Hawk and a Serpent: by the Sea-horse they fignified the Monster Typhon, by the other beafts, as namely the Hawk and the Serpent, how by this principality and government, which he had gotten by violence, he troubled both himself and others. Hercules had in his shield certain Serpents heads, pictured with these verses.

Plutarch. Pierius.

> Bis sena hic videas, stridentibus effera flammis, Colla venenato vultu maculofa draconum. Tum magis offenso spirantia gutture virus Quam magie Alcides effuso sanguine pugnat. Which may be Englished thus : Of Dragons heads twife fin here maist thou fee Raging amongst the flames with poyfoned spotted face : Cafting moft venom forth when they enraged be, As when Alcides faw bis bloud diftil apace.

And so Virgil faith of Aventinus.

Clypeoque imfigne parentum

Centum angues, cinclamque gerit Serpentibus Hydram, That is to fav:

His Shield an bundred Snakes, bie Fathers creft. An Hydra in their compass is entest.

Often which raigned among the Tyrrhenians, gave in his Standard and Coat of Arms a Serpent. Pierius. Now the people Ofice from whom it may be he was forung and derived) lived in Campania in Italy, as we have shewed aiready.

Of the Adder.

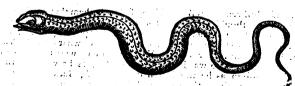

In ancient time we read, that when hostility began to be compounded, they had Heralds and Em-Suidas. In ancient time we which they called Caduceatores, which carryed upright a certain Rod or Staffe balladours of reasons, this Rod was very straight, and at the either side were artificially joyned two Serpents figures, winding and crooking into each other as the manner of Serpents is. This Rod was fo pents figures, the state of the fignified Perfect and Upright Reason or Understanding; by the two crooked Serpents at either side figured references, was figured the two Armies invading and affailing the Upright understanding, yet not prethereon, was in the paffed through and betwise them without harm, by truce and entreaties of Peace. This Rod was therefore confectated to Mercury, the tails of the Serpents reaching down to the handle or half of the Rod, where they were adorned with with wings. Alciatus made these Emblematical

> Anguibus implicitis, geminus Caduceus alis, Inter Amalt bee cornua redus adest. Pollentes sic mente vivos, fandique peritos Judicat, at rarum copia multa beet: In English thus; 2 wint Geres borns the Rod of Peace doth fland Upright with winding Snakes, and double-winged tails, To shew that mindes and tongues with Learnings brand, Are bleft with plenty in all wordly vails.

But having thus entred into the Hieroglyphical Emblems, if I should say so much as I finde made ready, and iquared for the architecture of this discourse, I might lose my felf in a voluminous world of matter, therefore I will but give the Reader a tafte hereof. By the Serpent in holy Wit, are many observative fignifications; and first, that the Devil himself, which is Molus Deus ma-I Mundi, an evil God of an evil World, should be tearmed and expressed by a Serpent. The cause saith Privin, is lingue motatio, the continual and never ceasing motion of a Serpents tongue: and so the continual and ever-working perswassons of Diabolical tentations, and a true mixture and simb of this old Serpent, speaketh otherwise with his tongue, then he thinketh with his heart. Therefore it is also said, that a natural Serpent hath a cloven or twisted tongue.

Comens faith truly, that Serpents do also fignific Men given over to fins, and fraudulent impostures or malices, I mos hybristes ho akotatios, lukos agrios ho pleoneticos, kai ophis ho apatroon, that is, There is an infolent and an intemperate As, there is a raging Wolf which is covetous, and there is a Serpent whiches an Impostor and fraudulent. The same learned man faith, that Riches are like to a Serpent: For as when an ignorant Man thinketh to take a Serpent without harm by the tail, the turneth backagain and biteth him; but if he take her by the neck, the cannot execute any part of her malice: even to when a wife Man hath the managing of riches, by vertue of his discretion he so charmeth them, that there is not in them any harm at all : but the foolish Man is mortally stung by his imprudent possession and dispensation of them.

Of the ADDER.

The let out in the particular Discourse of Serpents, that I express the most known Serpent to usin England, in the first place, according to alphabetical order, that is, the Adder. For albugh I am not ignorant, that there be which write it Nadere, of Native, which fignifieth a, water Stake, yet I cannot confent unto them fo readily, as to depart from the more vulgar received word

of a whole Nation, because of some likelyhood in the derivation from the Latine: For whereas Noof a whole Nation, because or some interpreted of Natrix, and Natrix of Natando, that is, swimming in defraved by the latter. because this Service is destroyed by the latter. dere may teem not improperly to be defined in selfroyed by the latter, because this Serpent whereof the water, the first conjectural derivation is destroyed by the latter, because this Serpent whereof the water, the first conjectural derivation is been drink in her time of thirst, and therefore we now intreat, haunteth not the waters, except for drink in her time of thirst, and therefore I mis. we now intreat, haunteth not the waters, each ther take that word to fignifie a Land Snake. And yet like the writing of Nadere for Adder; and rather take that word to fignifie a Land Snake. And yet like the writing of Nadere for Adder: and rauner table from Latine, I would not have the Reader if there be any good argument of derivation of English from Latine, I would not have the Reader think, but that the Adder may as well be derived a seria, from the earth which it use, or of ster, think, but that the Adder may as well be derived a seria, fierce. (for there is no Serias of ster, think, but that the Adder may as well be dearway at ere, (for there is no Serpent of that black, which is the colour that it beareth, or from atrox, fierce, (for there is no Serpent of that quantity, more fierce, angry, or hurtful,) as well as Nedere from Metrix.

Isidorus.

mantity, more herce, angry, or mantally reality, more herce from give fundry reality and capter this kinds of Serpent by the word Coluber, whereof fome give fundry reality in hadden and thad own places. The Latines do express sure sure of the Latines and inadowy places, or elfe a inbrien fors, either because colis umbras, it hanteth and liveth in hedges and inadowy places, or elfe a inbrien fons, either because consumoras, it mande de de le de la file de l tradition, of his winding pace or pacts. As which are about houses, are sometimes found without fieth wanting a tail, because the Snakes which are about houses, are sometimes found without tieth wanting a tail, necessite the parties of the point on hath no reason for the Adder, which tails, which have been strook off by men: but this opinion hath no reason for the Adder, which tails, which have been around by another that Pliny useth Galuber for a general word for Serpents, when is not domestical. Indeed I confess that Pliny useth Galuber for a general word for Serpents, when is not domestical. Indeed a comies the faith Coluber in equa viums, which deceived Theaphraftus and Gaza, applying it to the water Ser. he faith Coluber in aqua viveru, which accesses a resuperagina and a sound agree for the water Serpent. And so Erasmus and others, translate Ophin coluber, that is, the general Greek word for Serpent. And so Erasmus and others, translate Ophin coluber, that is, the general Greek word for Serpent, an Adder. There is also Calubra, as in Lucilian. The Indians call this Serpent Lo Sorram, Sersim, unto agree Horace, Virgil, and Cornelius Celleus. The Republic Calenure: the Spaniards. Culebra and control of the Republic Calenure. unto agree Horace, Virgit, and Curione Chipme, Colenure; the Spaniarde, Culebra, and at this day Colubra, la Scorzonara, la Scorfone. The Franch, Colenure; the Spaniarde, Culebra, and at this day the Grecians, Nerophis. And thus much for the name; except I may adde these verses of Vingilia his Georgicks.

Aut tello affuetm Coluber succedere & umbra Peftis acerba boum, pecorique afpergere virms Fouit humum. Cape faxa manu, cape robara paftor. Tollentemque minas, & Abila colla tumentem

Dejice, jamque fuga tumidum caput abdidit alià Cum medii nexus, extremaque agmina canda Solventur, turdofque trabit finm ultimm orbes.

Or when the Adder ufing bouse or stade Bred in the earth, the bane of Sheep and Neat, Then shepheard take both stone in band and blade, To qualt bis fwelling neck and biffing threat.

In English thus; Or when his fearful bead be puts full deep in canb To fly thy wrath, bim funder in the midft. Or cut bis tail, if no part elfe appeareth, For that will flay bis pace, while on't thou treadeft.

This is usual to call a Water-adder, a House-adder, a Land-snake, and such other, but catachrelie cally confounding one kinde with another. And thus much for the name of this Serpen. Thepris differ not from the general description before recited, it is long like an Eele, and hath many Epithetes, as virides colubri, green Adders, long, rough, venomous, divers coloured, swelling, sliding, winding, blew, terrible, secret, burtful, Meduscan, Cynipbian, Gorgonean Lybissine, biting, spound, wreathing, black, bending, heavy, scaly, and divers such other, as the Grammarians have obleved. But concerning the colour hereof, it is most commonly black on the back, sometimes greenished yellowish. The scales of it are more sharp then of the Snake, and therefore the Egyptami were wont to fay of the Thebane Adders, that they had a certain appearance of borns upon them, as we shall thew more at large in the story of Cerafics, or the horned Serpent.

Victorius speaking of the great worms which are bred in Mens bellies, doth call them Cacat Colubra, blinde Adders; but otherwife, the Adder which is proper to the earth, is not blinde, but feeth as tharply as any other Serpent either by day or by night. They are hotter then the Stakes, and there fore live more in the shadows, and lye for the most part round, folded up together like a rope, at the Poet noteth faying ;

> Hirtus & at coluber, nodofo gramine tellus Ventre cubat flexo, semper collectus in orbem. In English thus; As the rough Adder in knotty grafs is covered, Lyeth on her belly, and round in circle gathered.

They are a crafty and fubtil venomous Beaft, biting fuddenly them that pass by them, whereup on Jacob faid that his fon Dan should be Coluber in via, an Adder biting the Moese-heels, When the hath bitten, with her forked or twifted tongue the infuseth her poyton, whereof and the remedy ferving thereunto, there is this Hiltory in Ambrosius Pagens. At what time (faith he) Gharles the minth lay at Melines, I and Doctor Le Fenne the Kings Physitian, were fent for to cure a certain Cook of the Lady Castroperster, who was bitten by an Adder, as he was gathering wilde Hop in a hedge. The Cook affoon as he was bitten in the hand, sucked the wound with in mouth, thinking thereby to mitigate the pain, and draw out again the poylon, but allow as his tongue touched the wound, prefently it fo swelled that he could not speak; and besides he arm or shoulder swelled into a high bunch or tumour, which did put him unto painful countries informable has been also as the same of the ments, infomuch that he fwounded twice in our presence; his face and colour changed as thought would presently die : Whereat we all despaired to cure him, yet did not forsake him, nor lest some

Of the Ammodyta.

tome means to ease his cormence. Then we washed his tongue with Triacle, mixed with an equal proportion of white Wine and Aqua vita; then also I caused the arm to be scarified all over, and proposition place where the Adder had bitten him, out of which flowed abundance of corrupt matrecy bloud. Then we washed the wound with Triscle and Mithridate, in Aqua vice; so we caused tery ploud into warm bed; there to sweat, and commanded to keep him awake, which was done accordingly is and so the next day the swelling was abated, and the malignant symptomes were all evacuated: fo we gave order to keep the wound or launced place open, and afterward the Cook beganto be well again. This one example in flead of many, I thought good to infert into this place: that hereby the general cure may be learned and followed.

It agreeth with all other Serpents in the changing or putting off the skin; for after that by falling it bath made his field low and abated, then by fliding through a narrow passage, whereof Vingil thus writeth.

Qualis ubi in lucem coluber, mala gramina pafius, Lubrica convolvit Sublato pectore terga Frigida sub terra, tumidum quem bruma tegebat :

Arduus ad folem & linguis micat orat trifulcis; Nunc positis novus exuviis, nitidusque juventa.

Even as the Adder in the Spring ill fed and lean Movetb ber winding limbs , bolding up ber breast. Whom Winters cold whiles hid earth made fwell

Which may be Englished thus In Sun (hine with ber treble tongue exprest Dotb lick, and make to fbine ber skin, neat youib Renneth, and casts old coat, for beat ensueth.

S. From flith, that when the Adder is thirty and goeth to drink, the first of all at the water fide casteth up her venom, lest that by drinking it descend into her bowels, and so destroy herself, but after that fie hath drunk, fie licketh it up again; even as a Souldier re-armed after he was disarmed. Herodolus. The voyce of this Serpent is hiffing, although it be very feldom heard. And it is faid, that when Crasm undertook to wage war with Cyrm, the Suburbs of Sardis were all filled with Adders, which were devoured afterward by Horfes in the pastures. Whereat the King and people were not a little moved : But the Priests, after consultation with the Oracle, told them that it fignified, how strangers thould devour the people of that City ; because that Adders were bred in those coasts, therefore they took them to fignifie natural Inhabitants, and because Horses came from other Countries, there-fore strangers, (as Cyrus and his Souldiers) should be thereby signified. And this is to be noted, that the sufficiency of this Serpent, are the fame that are common to other, and the Hart above all other beafts of the earth. Yet this Serpent (faith S. Ambrofe) will kill a Lion and run away from

The Medicines arifing out of this Beaft; are, briefly these; The water wherein an Adder is Pliny. preserved alive, is a remedy against the poylon of a Toad : Also Adders or Vipers included in a pot Silvius. with the scrapings of Vines, and therein burnt to ashes, do help the Wens or Kings-evill. And Pliny alloaffirmeth, that if a Man which hunteth Grocodils, bear about him any part of the fat of an Adder,

orthegall mixed with the herb Potamigiton, he cannot be hurt by that Beaft.
Serpents and Adders, especially deaf Adders, fignific unrepentant wicked men, and also discord, as Virgit. the Poet describeth it, when Aletto fent a Serpent, Snake or Adder, to move contention in the family

of Anata, Libro 7. Eneid. And thus much for the Adder.

of the AMMODITE.

THis Serpent I call after the Greek name, Ammodytes, an Ammodyte. It is also found to be called Ammodyta, and Conchriss, or rather Centries, or Centrites, because of the hardness of their tails, which are also cloven on the upper side. The Italians call it Aspido del corno, because it hath upon the upper chap a hard Wart like a horn. The head of this Serpent is longer and greater then a Vipers head, and her chaps wider; besides the late expressed difference upon the upper lip : and set it may well be tearmed a kinde of Viper. It is Immanis fera, a fierce wilde Beaft, in length not above a cubit, having divers black spots upon the skin, and certain appearances of strakes or fmall lines upon the back. The colour of the other parts is ever like the fand wherein it keepeth and Olaus Mag. maketh abode, according to these verses of Lucan.

Avicenna.

Concolor exuftis, atque indiferetus arenis Ammodytes .-In English thus; The Ammodyte, indifcreet on the Land, Doth hold the colour of the burning fand.

The Countries most of all annoyed with these Serpents, are Lybia, Italy, and Illyria, especially about Gorinium, and the Mountains of Lampidia. Their harms are not inferiour to the flinging and Poylon of Aips, for Manbiolus writeth, that he bath known fome to die thereof within three hours ther the wound received. And if they do not die within fhore time, then doth the bloud iffue forth in abundant manner out of the hurt, and the wound swelleth. Afterward, all is turned into matter, and then followeth dulness in the head, and distraction in the minde; they live long which matter, and then followed duties in the industry lived above feven days: this also being ob. ferved, that those that be hurt by a female do die foonest. For together with their biting, they infuse a vehement pain, which causeth swelling, and the fore to run.

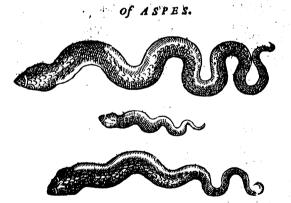

I finde the cure hereof in detim to be thus, first of all Triacle must be given to the fick persons drink, and also laid upon the wound, also drawing or attractive Plaisters, and such Poultesses which are fit for running Ulcers. But first before the Plaisters, scarific all the places about the hore, and binde the upper parts hard, then launce the fore a little with a Pen-knife, and let him drink free water with Rungwort, Gourds, Castoreum, and Cassia: Avicen prescribeth in the cure of these Servents venom Castoreum, Cinamon, the root of Centory, of each two ounces with Wine, and the root of long Hartwort, of Associate, the juyce of the root Gentian. And for emplaisher, Hony sodand dryed, and so pounded, the roots of Pomgranates, and Centory, the seed of Flax, and Lettere, and wilde Rue: And so I conclude with Doctor Gesner, Percussus ab Ammodyte sestinet adremedium, singua nemo affugere, He which is hurt by an Ammodyte, let him make haft for a remedy, without which never Man escaped death.

of the ARGES and ARGOLE.

Galen.

Here is mention made in Galen and Hippocrates, of a Serpent called Arges: Now Ares fignifi. eth in Greek white, fwift, idle, ill mannered : of this Serpent Hippocrates telleth this flory. There was (faith he) a young man drunk, which lay afleep upon his back in a certain house, gaping : Into this Mans mouth entered a Serpent called Argoes, the young Man perceiving it in his mouth, flived to speak and cry, but could not, and so suddenly gnashing his teeth, devoured and smallowed down the Serpent : After which he was put to intolerable pains, his hands fretching and quivering like as a Mans that is hanged or strangled, and in this fort he cast himself up and down and dyed. It feemeth therefore that this Serpent hath his name from the fudden destruction he bringeth to the treatures it finiteth, and therefore in ancient time we read that Mercury was called Argiphon, for killing of

The Argola are only mentioned by Suidas, for he faith, that Alexander brought them to Alex. dria from Argos, and cast them into the River to expel and devour the Aspes: where they continued a long time, till the bones of the Prophet Jeremy were brought out of Egypt unto Alexandria, which flew them, (as the same Author writeth:) And thus much of these two kindes of Serpens.

IN Hebrew as appeareth, Deut. 32. the Asp is called Pethen, in Psal. 58. Akschub, in Isa 59. & Jer. 8. Zipheoni, an Asp or a Cockatrice, worse then a Serpent. The Arabians, Hasper, and Historical Cockatrice, worse then a Serpent. foos; the Greeks, Afric; the Italians, Afre, and Afride: the Spaniards, Bivora; the Franch, Va afre; the Germans, Ein stlang gennant; and the Latines, Afric. About the notation or derivation of the word, there is some difference among Writers. Arisophanes deriveth it from Alpha, an intensit Particle, and Spize, which fignifieth to extend; either by reason of his sharp shrill histing, or for the length of his body. Others derive Apis from His, which fignifieth venom or poylon, and therefore faith the Scripture; The poyon of App, because that is a predominant poyon. The Line call it Afpit, qu'od venenum afpergit morfu, because it sprinkleth abroad his poyson when it biteth & fides we read of Apis a Buckler, an Island in the Lyoun Sea, a Mountain in Africk, and there is he thion of camping Souldiers in the field called Aspides.

The Epithers declaring the nature of this peftiferous Serpent, are lucheetes, rejoycing in poyfon, Elizoffa, winding, Lichmeres, putting out the tongue, Smerdales, fearfull, Phoineffa cruelly killing. Likewife in Latine, dry, sleeping, drousie, deadly, swelling, and Afru Pharia, a Pharian Asp, so called of the Island Pharm, where they abound. It maid that the Kings of Egyps did wear the Pictures of Cal. Rhod. Alos in their Crowns; whereby they fignified the invincible power of principality in this Creature, whose wounds cannot easily be cured: And the Priests of Egypt and Æthiopia did likewise wear very long Caps having toward their top athing like a Navel, about which are the forms of winding Aips, to fignifie to the people, that those which relifi GOD and Kings, fhall perifh Diodorus. by unrefilible violence. Likewise by an Asp stopping his car, was figured and understood a Rebel, Pietius. obeying no lawes or degrees of the Higher power a But let us leave this discourse of moralities. and come neerer to the naturall description of Asps. There are many kindes of Asps after the Alianut. Epptian division, for one kinde is called Afris sicca, a dry Asp. This is the longest of all other kindes, and it hath eyes flaming like fire, or burning coals; another kinde is called Afilm, which doth not only kill by biting, but alfo with forting, which it fendeth forth while it fetteth his recell hard together, and lifteth up the head. Another kinde is called Irundo, because of the similitude ir keepeth with Swallowes, for on the back it is black, and on the belly white, like as is a Swallow. Weread alfo in Albertus of, Afrie Hippalie, and Hippupex, but it may be that both these names fignifebut one kinde. This Hypnale killeth by fleeping, for after that the wound is given, the Patrent filleth into a deep and sweet fleep, wherein it dyeth: and therefore Leonicenus faith; Illam fuisse, ex cujus ventuo fibi Cleopatram fuavem mortem confervit, that it was the fame which Cleopatra bought to bring upon her felt a sweet and case death. There is also an Asp called Athaes, which is of divers colours; But I do confider that all the kindes may well be reduced to three, that is, Pryst. Actius. Cherfes, and Chelidonia; Ptyas hurteth by poysoning mens eyes, by spitting forth venom, Cherfes, Egineta. Iveth on the land, and Chelidonia in the waters.

The Afpisa small Serpent, like to a land Snake, but yet of a broader back; and except in this differeth not much from the Snake, their necks swell above measure, and if they hurt in that passion, there can be no remedy, for the stroak of their eyes are exceeding red and slaming, and there are two pieces of flesh like a hard skin which grow out of their foreheads; according to these

Praterea gemina valli instar fronte caruncla Herent, sanguineis scintillant lumina flammis. That is to fay; As hard as Brawn two bunches in their face Do grow, and flaming bloudy eyes their grace.

And the dry Alp, so called because it liveth in mid-lands, farre from any water, hath a vehement frong fight, and these eyes both in one and other are placed in the Temples of their head. Their tenhare exceeding long, and grow out of their mouth like a Boars, and through two of the longest are little hollowes, out of which he expresseth his poylon: They are also covered with thin and tender skins, which flide up when the Serpent biteth, and fo fuffer the poyfon to come out of the holes, afterward they return to their place again. Of all which thus writeth Nicander ;

Quatuor huic intra Marilla concava dentes, Radices fixere suas, quas junca quibufdam Pelliculis tunica obducit, trifte unde venenum Effundit, si forte suo se approximet bosti. In English thus;

Within the hollow of their cheeks fiery teeth are feen Fast rooted, which a coat of skin doth joyn and over-bide, From whence sad venom iffueth forth when she is keen, If that her fo she chance to touch as the doth glide.

The scales of the Asp are hard and dry, and red, above all other venomous Beasts, and by reason other exceeding drought, the is also accounted deaf. About their quantity here is some difference among Writers: For Ælianus faith, that they have been found of two cubits length, and their other parts answerable: Again, the Egyptians affirm them to be four cubits long: but both these may find together, for if Elianus say true, then the Egyptians are not deceived, because the Etitus. greate number containeth the lesser. The Asp Ptyss is about two cubits long: the Chessean Asps Avicenna. ted, that the grow to the length of five cubits; but the Chessean not above one, and this is no Arnoldus. ted, that the fhorter Asp killeth soonest, and the long more slowly: one being a pace, and another Stabo. a fathom in length. Nicander writeth thus;

Tam proceram extensa querum quem brachia duci; Tantaque crassities est, quantum missile telum, Quod faciens bafter delle faber expolit arte.

ded Ale, which when the is enchanted, to avoid the voyce of the Charmer, the stoppeth one of

Which may be thus Englished; As wide as arms in force out-fretched, So is the Afp in length, And broad even as a casting Dart, Made by a wife Smiths Strength.

Aetius. Olam.

The colour of Alps is also various and divers, for the Irundo Asp, that is, the Chelidenten, telem. The colour of Alps is ano various and divers, for the state of the Swallow; the Piyes or spitting Asp resembleth an Ash colour, staming like Gold, and bleth the Swallow; the Piyes or spitting Asp resembleth an Ash colour, or green, but this fares in the colour of the colour or green, but this fares in the colour of the colour or green, but this fares in the colour of the c bleth the Swallow; the ross or lineting and the colour or green, but this later is more rare, and fomewhat greenish; the Cherfean Asp of an Ash colour or green, but this later is more rare, and Pieris faith, that he faw a yellow Asp neer Bellun : Of these colours writeth Nicander:

Squalidus interdum color albet, sape virenti, Cum maculie fape eft cineres imitante figura. Nonnunquam ardenti veluti succenditur igne. Thus overtherwise :

Idane nigra Aethiopum fub terra, quale refujut Nilus Cape lutum, vicinum in Nerea volvit.

Their colour whitish pale, and sometime lively green, And (pots which do the Ash resemble, Some fiery red : in Ethiop black Afps are feen,

And some again like to Nerean mud. Cast up by flowing of the Nilus floud.

Am. Parem.

Bellonius.

The Countreys which breed Asps, are not only the Regions of Africk, and the Confines of Nilm, but also in the Northern parts of the World (as writeth Olam Magnum) are many Asps. found: like as there are many other Serpents found, although their venom or poylon be much more weak then, in Africa; yet he faith, that their poyfon will kill a man within three or fone more wear then, in Spain also there are Asps, but none in France, although the common people do fivle a certain creeping thing by that name. Lucan thinketh that the Original of all came from Africe, and therefore concludeth, that Merchants for gain have transported them into Europe, faying;

Ipfa coloris egens, gelidum tion transit in orbem Sponte fua, Niloque tenus metitur arenas. Sed quie erit nobie lucri pudor ? Inde petuntur, Huc Lybica mortes & fecimus Affida merces.

In English thus;

The Afp into cold Regions not willingly doth go, But neer the banks of Nilus warm, doth play upon the fands. Ob what a frame, of wicked gain must me then undergo, Which Lybian deaths and Aspish waves have brought into our lands?

Ælianus.

Their abode is for the most part in dryest soyls, except the Ghelidonian or Water Ass, which live in the banks of Nilus all the year long, as in a house and safe Castle, but when they perceive that the water will overflow, they forfake the banks fides, and for fafeguard of their lives, betake them to the Mountains. Sometimes also they will ascend and climbe trees: as appeareth by an Epigram of Anthologius. It is a horrible, fearfull, and terrible Serpent, going flowly, having a weak fight, alwayes fleepy and drowfie, but a shrill and quick sense of hearing, whereby their warned and advertised of all noyse, which when she heareth, presently she gathereth her self round into a circle and in the middest listeeth up her terrible head: Wherein a man may note the gracious providence of Almighty GOD, which bath given as many remedies against evil, asthere are evils in the World. For the dulnesse of this Serpents fight, and slownesse of her pace, doth keep her from many mischiefs. These properties are thus expressed by Nicander;

Gillius.

Formidabile cui corpus, tardumque volumen, Quandoquidem tranfverfa via eft prolixaque ventris Spira, veternofique nivere videntur ocelli. At Simul ac facili forte abservaverit aure

Vel minimm frepitum, fegnes è corpore fammes Excutit. O teretem finuat mox afperatradum, Horrendumque caput porrettaque pettoratellis.

This feared Afp bath flow and winding pace. When as her way on belly fhe doth traverfe. Her eyes (brunk in ber bead winking, appear in face,

In English thus; Till that some neise her watchfull eat deb swift, Then sleep shak'd off, round is her benjabered, With dreadfull head, on mounted neckup lifud.

Thee

The voice of the Asp is histing, like all other Serpents, and seldome is it heard to untersay voyce or found at all, except when the is endangered, or ready to fet upon her enemy. What upon faith Nicander :

-Grave sibilat ipsa Bestia, dum certam vomit ira concita mortem.

In English thus;

This beaft doth hiffe, with great and loudest breath, When in her mood she threatneth certain death.

her ears with her tail, and the other she holdeth hard to the earth .: And of this incantation thus writeth Vineratius Bolinacenfes. Vertute querumdam verborum incantatur Apis, ne veneno interimat, vel at writeth Vincentum Dominion of the profit, of general de fronte of majorit, que natur alier in conscitur, that is to fay, The Afpis enchanted by vertue of certain words, fo as the cannot kill with her poylon, or as fome fay, be taken quietly without refishance, and so the Gem or pretious Stone be taken out of her fore. head, which naturally groweth therein. And from the words of the Plalm aforesaid, not only the heas, which make the control of charming is gathered by Plerim, but also by many justified in the case of certains to the series of a have already given mine opinion in the former general Treatife, unto the which I will only adde thus much in conclusion, which I have found in a certain unnamed Author; Demones distinct can verbie ad Serpentes, & insettione interiori boc facunt, in Serpentes ad natum corum movean-un, ac sine lessine trasabiles exhiboaniur: Which is thus much in effect; Devils run up and down with words of enchantment to Serpents, and by an inward or fecret infection, they bring to pass that the Serpents dispose themselves after their pleasure, and so are handled without all harm. And indeed, that it may appear to be manifelt, that this incantation of Serpents is from the Devil, and not from God, this only may suffice any reasonable man: because the Plalmist plainly expressed, that the Serpent shifteth it off, and avoideth Perinffinas mufitamium in antationes, the most skifful Charmes. Nowif it came from the unrelistable power of Almighty God, is should pass the relistance of them or Devile; but being a fallacy of the Devil, the Serpent (wifer in this point then Men that believe it) cafily turneth tail against it : and in this thing we may learn to be wife as Serpents, against the inchanting temptation of the Devil or Men, which would beguite us with shadows of words and promifes of no valuable pleafures. If we may believe Pliny, Ælianus, and Philarchus, the Egyptians lived familiarly with Afps, and with

continued kindenels wan them to be tame. For indeed among other parts of their favage beaftlines, they worshippedAsps even as houshold Gods, by means whereof the subtil Serpent grew to a sensible concit of his own honour and freedom, and therefore would walk up and down and play with their children, doing no harm, except they were wronged, and would come and lick meat from the table, when they were called by a certain fignificant noile, made by knacking of the fingers. For the guests after their dinner, would mix together Hony, Wine, and Meal, and then give the fign, at the hearing whereof they would all of them come forth of their holes; and creeping up, or lifting their heads to the table, leaving their lower parts on the ground, there licked they the faid prepared meat, in great temperance by little and little without any ravening, and then afterward departed when they werefilled. And so great is the reverence they bear to Asps, that if any in the house have need to tilein the night time out of their beds, they first of all give out the fign or token, lest they should hun the Aip, and so provoke it against them : at the hearing whereof, all the Aips get them to their

boles and lodgings, till the person stirring be laid again in his bed,

The holy kinde of Alps they call T bermufis, and this is used and fed in all their Temples of Ifit with thefatof Oxen or Kine. Once in the year they crown with them the Image of Ifit, and they fay that this kinde is not an enemy to Men, except to fuch as are very evill, whereupon it is death to kill

lisreported of a certain Gardiner making a ditch or trench in his Vineyard, by chance and ignorantly, he fet his spade upon one of these Thermusis Asps, and so cut it asunder, and when he turned up the earth, he found the hinder part dead, and the fore-part bleeding and ftirring : at which fight his superfittious heart overcome with a vain fear, became so passionately distressed, that he fell into a vehement and lamentable frenzy. So that all the day time he was not his own man, and in the night, in his mad fits he leapt out of his bed, crying out with piciful and eager complaint, that the Asp did bite him, the Asp did wound him, and that he saw the picture of the said Asp (by him formerly slain) following him, and tearing his flesh, and therefore most instantly craved help against it, saying still he perished by it, he was mortally wounded. And when he had now (futh Elianus) continued a while in this superstitious fury and difease of the minde, his kindred and acquaintance brought him into the house of Serapis, making request unto that fained God to remove out of his fight that spectre and apparition; and so he was released, cured and restored to his

This kinde of Asp they also say is immortal and never dyeth, and besides it is a revenger of facrihige, as may appear by such another History in the same place. There was a certain Indian Peacock kntothe King of Expr., which for the goodly proportion and feature thereof, the King out of his devotion confecrated to Jupiter, and was kept in the Temple. Now there was (faith he) a certain population of the confecrated to several the confecrated the confecrated to several the confecrated young Min which fet more by his belly, then by his God, which fell into a great longing for to eat of the laid Peacock : and therefore to attain his appetite, he bribed one of the Officers of the Temple with a good fum of Money to fleal the faid Peacock, and bring it to him alive or dead. The coverous wretch enraged with the defire of the Money, fought his opportunity to feel away the Pear oct, and one day came to the place where he thought and knew it was kept, but when he came, he Iw nothing but an Asp in the place thereof, and fo in great fear leaped back to save his life, and afterard difclosed the whole matter. Thus far Ællanus.

The domestical Asps understand right and wrong, and therefore Philambus telleth a story of such to Alp, which was a female, and had young ones: in her absence one of her young ones killed a Adianus.

Pliny.

Suides.

childe in the House: When the old one came again according to her custom to seek her meat, the childe in the House: When the old one take again and it her meat, the killed childe was laid forth, and so she understood the harm: Then went she and killed that young the laid reported, that there was an Asia was hard to the house. une, and never more appeared in that house. It is also reported, that there was an Asp that sell one, and never more appeared in that house and never more appeared in that house as the Drowing of Farett called Heroulia makes. one, and never more appeared in that house of Egypt, called Heroulia, whose love to the in love with a little Boy that kept Geese in the Province of Egypt, called Heroulia, whose love to the in love with a little Boy that kept Geet in the Alp grew jealous thereof. Whereupon one day as he lay afleep, fet upon him to kill him, but the other feeing the danger of her love, awaked and delivered him.

The History of Serpents.

livered him.

There is much and often mention made of Asps in holy Scripture, beside the forenamed place, There is much and often mention made of Alps, and their labours to Spiders webs. And Ela. 1981, as in Ela. 59. the Jews are compared to Alps, and their labours to Spiders webs. And Ela. 11. The sucking childe shall play upon the hole of the Asp. Whereupon a learned man thus writeth, Qui. 11. The jucking contact from programmen, and more and programmen, jub regno Christi mutato ingenio fore vel puris incunq; ex la minibus occulto veneno ad nocendum referti Junt, jub regno Christi mutato ingenio fore vel puris incunq; ex la minibus occulto. tung; ex to minuous occurred on the Kingdom of nature are apt to do harm to other, in the Kingdom of Christ their nature shall be so changed, that they shall not harm sucklings, not able to discover of Christ their nature man be to than good for them. Great is the fubriley and fore-knowledge of Afps, as may appear by that in Pfal. 58. against them. Great is the lubble of the float the Alps of Nilm do thirty days before the float the Charmers voyce. As also it is strange, that all the Asps of Nilm do thirty days before the float the Charmers voyce. As allowed in the Mountains, and this is done yearly, once at the left, remove them follows and their young ones into the Mountains, and this is done yearly, once at the left,

not more often. They fort themselves by couples, and do live as it were in marriage, Male and Female, to that their I ney for themselves by couples, and and the fame: for if it happen that one of them be killed, fense, affection, and compassion, is one and the fame: they follow the person eagerly, and will finde him out, even in the midst of many of his fellows: that is, if the killer be a beaft, they will know him among beafts of the fame kinde: and if he bea man, they will also finde him out among men : and if he be let alone, he will not among thoulands harm any but he: breaking through all difficulties (except water,) and is hindred by nothing ele, except by swift flying away. We have shewed already, how the Plyllians in Asia cast their children newly born to Serpents, because if they be of the right feed and kindred to their Father, no Serpent will hurt them, but if they be Bastards of another race, the Serpents devoutthem: these Serpents areto be understood to be Asps. Asps also we have shewed were destroyed by the digit, which Alexander brought from Argos to Alexandria, and therefore those are to be reckoned their enemies Shadows do allo fcare away & terrifie Afps, as Seneca writeth. But there is not more moral hatred or deadly war betwixt any, then betwixt the Ichneumon and the Asp. When the Ichneumon hath espyed an Asp, the first goeth and calleth her fellows to help her, then they all beforetheyenter fight do wallow their bodies in flime, or wet themselves, and then wallow in the fand, so hanes fing, and as it were arming their skins against the teeth of their enemy : and so when they finde themselves frong enough, they set upon her, briftling up their tails first of all, and turning to the Scrpent till the Asp bite at them, and then sodainly ere the Asp can recover, with singular celenty they flie to her chaps and tear her in pieces, but the victory of this combate refleth in amicipation, for if the Afp first bite the Ichneumon, then is he overcome, but if the Ichneumon first lay hold on the Asp, then is the Asp overcome. This hatred and contention is thus described by Nicander 3

> Solus eam potis est Ichneumon vincere pestem, Cum grave cautus ei bellum parat, editaq; ova Que fovet in multorum hominum insuperabile lethum, Omnia fratta terit, mordaceq; dente laceffit. That is to fay: Ichneumon only is of strength, that pest to overquells

Gainst whom in wary wife his war be doth prepare, Her egges, a deadly death to many men, in fand he doth out smell, To break them all within his teeth, this nimble beaft doth dare.

Pliny, Cardan, and Constantine affirm, that the herb Arum, and the root of Winterberry, do fo the nish Asps, that their presence layeth them in a deadly sleep: and thus much of their concord with other creatures.

Galen writeth, that the Marsians do eat Asps without all harm, although as Mercurial faith, their whole flesh and body is so venomous, and so repleat with poyson, that it never enterethinto medicine, or is applyed to fick or found upon any Physical qualification: the reason of this is given by himself and Fracefforius, to be either, because Aspsunder their Climate or Region are not renomous at all, as in other Countries, neither Vipers nor Serpents are venomous: or else because those people have a kinde of fympathy in nature with them, by reason whereof they can receive no pof-

The poylon of Alps faith Mifes, Deut. 32. is crudele venenum, a cruel poylon, and Job, 20. cap. coprelling the wicked mans delight in evil, faith; That he shall such the poylon of Alps. For which cauch the poylon of Alps. For which cauch the poylon of Alps. as we have flewed already, the harm of this is not eafily cured. We read that Canopui, the Male of Menelaus ship, to be bitten to death by an Asp at Canopia in Egypt., So also was Demenia Pholonia. Scholar of Theophrofim, and the Keeper of the famous Library of Ptoleman Seier. Cleopatralikate to avoid the triumph that Augustus would have made of her, suffered her self willingly to be button to death by an Afp. Wheeupon Propertius writeth thus:

Brachia speciavi sacris admorsa colubris, Et trabere occultum membra soporis iter. In English thus :

Thus I have feen those wounded arms. With sacred Snakes bitten deep. And members draw their poyloned harms, Treading the way of deaths found fleep.

We read also of certain Mountebanks, and cunning Juglers in Italy, called Circulatores, to perish by Elianus, their own deviles through the eating of Serpents, and Asps which they carryed about in Boxes as time, using them for oftentation to get Money, or to fell away their Antidotes. When Pompeius Rufin was the great Master of the Temple-works at Rome, there was a certain Circulator or Quackfalver, to flew his great cunning in the presence of many other of his own trade, which set to his arm an Asp, presently he sucked out the poyson out of the wound with his mouth : but when he came to look for his prefervative water, or antidote, he could not finde it; by means whereof the poyfon fell down into his body, his mouth and gums rotted prefently, by little and little, and fo within two days he was found dead. The like ftory unto this is related by Amb. Parane, of another, which at Florence would fain sell much of his medicine against poyson, and for that purpose suffered an Asp to bite his fielh or finger, but within four hours after he perished, notwithstanding all his antidotical pre-

Now therefore it remaineth, that we add in the conclusion of this History, a particular discourse of the bitings and venom of this Serpent, and also of such remedies as are appointed for the same. Therefore we are to confider, that they bite and do not sting, the semales bite with four teeth, the Mercurial. males but with two, and when they have opened the flesh by biting, then they infuse their poyson Actius. into the wound. Only the Asp Piyas, killeth by spitting venom through her teeth, and (as Avicen faith) the favour or finell thereof will kill, but at the least the touching infecteth mortally. When an Asp hath bitten, it is a very difficult thing to espy the place bitten or wounded, even with most excellent eyes, as was apparent upon Cleopatra aforesaid; and the reason hereof is given to be this, because the poyson of Asps is very sharp, and penetrateth suddenly and forcibly under the skin, even to the inmost parts, not staying outwardly, or making any great visible external appearance. Yet Gelenwriting to Pife, affirmeth otherwise of the wound of Gleopatra; but because drowlines and sleep followeth that poyfon, I rather believe the former opinion: and therefore Lucan calleth the Afp, Somifer, that is, a fleep-bringing Serpent. And Pictorius also subscribeth hereunto.

Ajpidis & morsu lasum dormire satentur In mortem, antiditum nec valuisse ferunt. Which may be Englished thus: He that by rage of Asps tooth is bitten or is wounded, They say doth sleep until his death cureless, be is confounded.

The pricks of the Asps teeth, are in appearance not much greater then the prickings of a needle, without all swelling, and very little bloud iffueth forth, and that is black in colour; straightway the tresgrowdark and heavy, and a manifold pain arifeth all over the body, yet fuch as is mixed with lome sense of pleasure, which caused Nicander to cry out, Perimitque virum absque dolore, it kills a man without pain. His colour is all changed, and appeareth greenish like grass. His face or forehead is bent continually frowning, and his eyes or eye-lids moving up and down in drowfiness without sense, according to these verses following.

Nec tamen ulla vides impressi vulnera morsus, Nec dignus fatu tumor icum corpus adurit. Sed qui lasur homo est, citra omnem fata dolerem Claudit, & ignavo moriens torpore fatiscit. Which I translate thus; Wounds of impressed teeth, none canst thou fee,

Nor tumour worth the naming, smitten body burning, But yet the burt man painless taketh destiny, And Sleeping dyeth, Sluggishly bim turning.

The true fignes then of an Asps biting, is stupour or astonishment, heaviness of the head, and nothing of the butthofe which are hurt by the Piyes, have blindeness, pain at the heart, deafness, and seeling of the heart, deafness, and seeling of the heart, deafness, and seeling of the heart of t fielling of the face. And the signes of such as are hurt by the Chalidonian or Chersean Asp, and the Implian are all one, or of very little difference, except that I may adde the Cramp and the often being of the pulse, and frigidity of the members or parts', or pain in the stomach, but all of them bitten turneth black; it is apparent and manifest, that the poyson of the Asp mortifieth or

Textor.

The History of Serpents.

Ponzettus.

or silleth the natural heat, which is overcome by the heat of the poylon outwardly, and the dark or killeth the natural neat, which is overled to feertain vapours which are infected, and ascendup to nesses or blindnesse of the eyes proceedeth of certain vapours which are infected, and ascendup to nesse or blindnesse of the brain: and when the humors are troubled in the stomach, then followeth the disturbance of the brain: and when the knuckles are drawn in by the venitting or else the cramp, and sometimes a looseness when the knuckles are drawn in by the venitting down into the intrails. To conclude vomiting or else the cramp, and sometimes a southers when the arrange are drawn in by the venomous biting, or the infected humors falling down into the intrails. To conclude, so great is the tabistical effect of this poyson of Asp, that it is worthily accounted the greatest venom, and most dangerous of all other; for Elianus saith, Serpentum venenum cum pessiferum set, tum multi assistances in pessiferum. but the venom of the Asp most of all dangerous of all other; for Milanin latti, bergens, but the venom of the Asp most of all. For if it lenius, the poylon of all serpents is petitietous, and all for if it touch a green wound, it killeth speedily, but an old wound receiveth harm thereby more hardly. In touch a green wound, it killeth specully, but an idden death, they would fet an Afp to his bofom or Alexandria, when they would put a Man to a fidden death, they would fet an Afp to his bofom or Alexandria, when they would put a main to a induced assets as the party walk up and down, and so immediately with in two or three turns he would fall down dead. Yet it is reported by Pliny, that the poyson of the party walk up and down, and so immediately with in two or three turns he would fall down dead. Yet it is reported by Pliny, that the poyson of in two or three turns he would sait and yet if a Man eat of the flesh of any beat slain by Asps drunk into the body doth no harm at all, and yet if a Man eat of the flesh of any beat slain by an Asp, he dyeth immediately.

Galen.

Dioscorid. A El uarius. Ægineta.

Paraus.

Actius.

But concerning the cure of such as have been, or may be hurt by Asps, I will now entreat nor founding any time to confute those, who have wrote that it is incurable: on the contrary it shall be manifest, that both by Chirurgery and Medicines, compound and simple, this both hath been and may happily be effected. First it is necessary when a Man is stung or bitten by a Serpent, that the wounded part be cut off by the hand of some skilful Chirurgeon, or else the stellar round about the wound, with the wound it felf to be circumcifed and cut with a sharp Rasor; then let the houses burning things be applyed, even the fearing Iron to the very bone. For fo the occasion being then away from the poyfon to pread any further, it must needs die without any further damage. Then also the holes in the mean time before the ejection must be drawn, either with Cupping glasse or with a Reed, or with the naked rump of a Ringdove or Cock; I mean the very hole fet upon the bitten place. And because the hole is very narrow and small, it must be opened and made wider, the bloud be drawn forth by fcarifications, and then must fuch medicinal herbs be applyed as are most opposite to poyson, as Rue, and such like. And because the poyson of Asps doth congeal the bloud in the veins, therefore against the same muit all hot things made thin be applyed, as Mithridaum and Triacle dissolved in Aqua vite, and the same also dissolved into the wound; then must the Patient be used to bathings, fricasing or rubbing, and walking, with such like exercises. But when once the wound beginneth to be purple, green, or black, it is a fign both of the extinguishment of the ve. nom, and also of the suffocating of natural heat, then is nothing more safe then to cut of the menber, if the party be able to bear it. After Cupping-glasses, and Scarifications, there is nothing that can be more profitably applyed then Centory, Myrrh, and Opium, or Sorrel after the manner of a Plaister. But the body must be kept in daily motion and agitation, the wounds themselves often searched and pressed, and Sea-water used for somentation. Butter likewise, and the leaves of Yew, are very good to be applyed to the bitings of Asps. And in the Northern Regions, (as witnesseth Olam Magnus,) they use nothing but Bran like a Plaister, and their Cattle they anoint with Tracleand Salt all over the bunch or swelling. And thus much for the Chirurgical cure of the biting of Afps, In the next place, we may also relate the medicinal cure, especially of such things as are compound, and received inwardly. First, after the wound, it is good to make the party vomit, and then afterward make him drink

juyce of Yew and Triacle, or in the default thereof, Wine, as much of the juyce as a groat weight, or rather more. But for the tryal of the parties recovery, give him the powder of Centory in Wine to drink, and if he keep the medicine, he will live, but if he vomit or cast it up, he will de

thereof. But for the better avoidance and purging out the digested venom, distributed into every

part of his body, give the party Garlick beaten with Zythum, until he vomit, or elfe Oppment in Wine allayed with water: also Origan dry and green. After the vomit, the former antidotical medicines may be used. And the Northern people use no other Triacle then Venetian. Whereas there

Mercurialis.

Andreas.

are aboundance of all manner of Serpents in the Spanish Islands, yet never are any found there to ule Triacle, neither do they account of it as of a thing any whit vertuous, but instead thereof they use the bearded Thapfia, Gilly-flowers, and red Violets, and the herb Avance, boyled in Wine Vinegar, the sharpest that may be gotten, and a found mans Urine, wherewithall they bathe the wounded part, although much time after the hurt received. But faith Amb. Parem, it is much better for the Patient to drink thereof falling, and before meat two hours, three ounces at a time. And by the

Actius.

help of this notable experiment, the Inhabitants of those Islands are nothing afraid to offer their bodies to be bitten by the most angry Asps. And thus much for compound medicines in general.

It is said, that the first and chiefest easie remedy for such as are bitten by Asps, is to drink so much of the sharpest Vinegar, as he can sensibly perceive and feel the same upon the right side of his midriffe, because that poyson first of all depriveth the liver of sense. For Pliny faith, that he knews man carrying a bottle of Vinegar to be bitten by an Asp, whiles by chance he trode thereupon, be as long as he bore the Vinegar and did not fet it down, he felt no pain thereby, but as often as to ease himself he set the bottle out of his hand, he selt torment by the poyson, which being related to the Designation of the De to the Physicians, they knew thereby that Vinegar drunk into the stomach was a foveraign antibot against poyson. Yet some say, that the first knowledge of this vertue in Vinegar, grew from the necessity which a little boy bitten by an Asp had of drinking, and finding no other liquor both bottle of Vinegar, drank thereof a full draught, and so was eased of his pain. For the reason is

that it hath both a refrigerative, and also a diffipating yertue, as may appear when it is poured on Cor. Cellin. that it until because it yeeldeth a froth, and therefore when it cometh into the domach, it disperseth all theinfected humors.

the Northern Shepheards do drink Garlick and stale Ale against the bitings of Asps. And some Olaut Mac. hold an opinion that Anifeed is an antidote for this fore. Others use Hart-wort, Apium seed: and wine. Arm being burned, hath the vertue to drive away Serpents, and therefore being drunk with Oyl of bays in black Wine, it is accounted very foveraign against the bitings of Asps. The with Oylor, with a little powder of Gentian in Wine, or the juyce of Mints, keepeth the for much from the Cramp after a Man is bitten by an Asp. Others give Castoreum, with Lignum Castie, and fomethe skin of a Storks stomach or maw. There be certain little filthy and corrupt Worms bred in totten wood or paper, called Cimices, these are very profitable against poyson of Asps. or any

other venomous biting beaft, and therefore it is faid that Hens and other Pullein do earneftly feek

after these worms, and that the stesh of such fowl as have eaten thereof; is also profitable for the iame purpofe.

Athenem also writeth, how certain Theeves were condemned to be cast to Serpents to be dedroved, now the morning before they came forth, they had given them to eat Citrons; when they were brought to the place of execution, there were Asps put forth unto them, who bit them, and were distributed to give one of them a Citron, and the other none, so when they were brought forth again the Afps fell on them. and flew them that had not eaten Citron, but the other had no harm at all. The Egyptian Chemati Pliny. or Perining drunk in Vinegar, is very good against the poyson of Asps; so likewise is Corral in Orpheus. Wine or the leaves of Yew. Henbane bruised with the leaves thereof, and also bitter Hops have the same operation. The urine of a Tortoise drunk, is a medicine against all bitings of wilde beasts. and the urine of a Man hurt by an Alp, as Marcus Varre affirmed in the eighty ninth year of his age; according to the observation of Serenus faying

Si vero borrendum vulnus fera fecerit Afbis, Utinam credunt propriam convucers your.

Varronis fuit ista sententia, nec non

Victoria de manarat sumoti invatimber aceti. Plinim ut memorat, sumpti juvat imber aceti. Which may be Englished thus

If that an Asp a mortal wound do bite, It's thought his urine well doth cure again, Such was the faying of old Varro hight,

And: Pliny too, drink Vinegar like drops of rain.

Postda. But it is more fafe to agree with Pliny in the prescription of Mans urine, to restrain it to the thit never had any beards. And more particularly against the Asp called Pigat; and Mathiolas out of Dioforider faith, that the quinteffence of Aqua vite, and the ufual antidote both mixed together and drunk, is most powerful against the venoms of the deaf Asp. And thus much for the animathy and cure of Afps biting venomous nature, whereunto I will add for a conclusion, that prorebial freech, of one Afp borrowing poylon of another, out of Tertullian against the Heretick Marcon, who gathered many of this abfurd impleties from the unbelieving Jews. Definal mune bereticas a Judes of it good alunt a Vipera viutuari venenum, that is, let the heretick now ceafe to borrow his venom of a few, as the Alps do borrow their poylon from Vipers. And true it is, that this proverb hath of a few, as the Alps do borrow, their poylon aroun vipers. Lend true 10.19, what the first fawle defectable when one bad man is holp or counfelled by another; and therefore when Divernes fawle company of women talking sogether, he faid merrily unto them, Aspis par echidnes pharmacha dance and that is, the Asp borroweth we nom of the Viper. Thus much of the Asp.

Strenes, à fuavi camus from their twoet wyce. The Latines call them by one general name, Apis and Apest Varro sometimes terms them Hoss, avery improperly, for they might better be named Volucies, not Aver; Sor duth for their addies, to the deficiency, when it is me and the little and the services are services been nicked as a validated.

It is

in Bees.

A.um definitio. A Bee is a cut-wasted living creature, that can five, having four wings, and bloudleffe, the only Crafts-master of Hony-making. Their eyes are somewhat of a horny substance; hid deep Description of in their bodies, as is also their sting : they want neither tongue nor teeth, they have four their parts.

wings, being of a bright and clear colour growingto their moulder-blades, whereof the two hinder-most are the lesser, because they might not hinder their flying : and out of their fhort feet or stumps there grow forth as it were two fingers , wherein they carry a little stone, for

the poiling and making weighty their fmall . bodies in stormy, tempestuous, blustering or troublesome weather, for fear lest they might be driven from their house and home, by the contrary rage and violence of the windes.

No respiration They do not breath (by Plinies good leave) but either pants move, or ftir (as the heart or brain doth) and by transpiration they are comforted, refreshed, and made lively. Their stomach is contexed and framed of the thinnest

part of all their members, wherein they not only retain, and fafely keep their Honey dew which they have gathered, but also digest, purific, and clense it, which is the true and only sesson. who

the Honey of Bees is longer kept pure and fine, then any Manna or Meldew, or rather it is not ar all subject to corruption.

Bees even by nature are much different: for fome are more domestical and tame, and otheragain Ditterences of are altogether wilde, uplandish, and agrestial. Those former are much delighted with the familiar friendship, custom and company of men, but these can in no wife brook or endure them, but no ther keep their trade of Honey-making in old trees, caves, holes, and in the ruders, and rubbith of old walls and houses. Of tame Bees again, some of them live in pleasant and delightful Gardens, and abounding with all fweet fenting and odoriferous plants and herbs; and thefe are great, foft, fat, and big belived. Others again, there be of them that live in Towns and Villages, whole fludy and labour is to gather Honey from fuch, plants as come next to hand, and which grow farther off, and these are lesser in proportion of body rough and more unpleasant in handling; butin Jabbur, indultry, wit and cunning, far furpaffing the former. Of both forts of thefe, some have Mings (as all true Bees have :) others again are without a fting, as counterfeit and ballerdy Beb, which (even like the idle, fluggish, lither, and ravenous cloystered Monks, thrice worfsthen there) you shall fee to he more gorbellied, have largen throats, and bigger bodies, yet mither exclient or markable, either for any good behaviour and conditions, or gifts of the minde. Men call thek supprofitable; cattles and good for nothing, Fuer, that is Drones; either because they would feem w balahourers, when imfeed they are not : or because that under the colour and pretent of them Afor you shall sometime have them to carry was, and to be very buffe in forming and making Ho iney-dombes,), they may ear up all the Honey. These Drones are of a more blackine tolour, forewhat flinning, and are cafily known by the greatness of their bodies. Besides form Bes are for faculed of the Kingly race, and born of the blond Royal: whereof driffolle manel h two forms a yellow kinde, which is the more noble, and the black, garnished with divers colours, Some mike three Kings, differing in colour, as black, red, and divers coloured. Menecrates faith, that thok who are of fundry colours are the worfer, but in case they have diversity of colour with some black Defeription of neffe, they are efteemed the better Hothat is blefted Monarch () and Captain General of the whole swarm, is ever of a tall, personable, and heroical stature, being twice so high as the rest, bis wings thorter, his legs fitsight, brawny, and floorg, his gate, parer and manner of healings don lofty, flately, and appreher of a venerable countonance, and in his forel head there is want to fisot on, mark with B. Dissen; for he far different from the popular and inferiour for mule come Differences in lingtifer beauty, and linguour. of the Bee.

neither can any man afterwards either by their figure and quality of their bodies or skink, judge or different certainly their age (as we say by experience in Horles:) For the elder fore of them are rough, hard thin and lean scrage, starvelings, loathsome to touch and to look upon, somewhat long, nothing but skin and bone, yet very notorious and goodly to fee to, in regard of their gravity, hoarinels and anciency. But as they be in form and shape, nothing so excellent, so yet in experience and industry they far, out-strip the younger fort, as those whom time bath made more learned a and industry they royned with ule, hath sufficiently instructed and brought up in the Art or trade of Honey-making.

loney-making.

The place likewife altereth one whiles their form, and fometimes again their nathro (41) their The difference fer and age do both.) For in the Islands of Molucta, there be Begs very like to winged Primires, but of the form of fomewhat leffer then the greater Bees, as Maximilian Transitvanus, in an Epittle of his written to the Bees according Bilhop of Salfpurge, at large relateth it. Andrew Thever in his book that he wrote of the New-found World, Chap. 11. amongst other matters reporteth that he did see a company of flies or Honey-bees Bees of Ameabout a tree named Papebason, which then was green, with the which these Honey-bees do live and vica. nourish themselves; of the which trees there were a great number in a hole, that was, in a tree. wherein they made Honey and Wax. There is two kindes of the Honey-bees, one kinde are as great as ours, the which cometh not only bur of good imelling flowers, allo their Honey is very good, but their Wax not to yellow as ours. There is another kinde half to great as the other: their Honey's better then the other, and the wilde men name them Hira. They live not with the others food, which to my judgement maketh their Wax to be as black as coals, and they make great plenty, specially near to the River Vasses, and of Plate. The Bees called Chalcoides, which are of the colour of brais, and somewhat long, which are said to live in the Island of Greia, are implacable, great fighters and quarrellers, excelling all others in their stings, and more cruel then any others, so that with their sings they have chased the Inhabitants out of their Cities; the remainder of which Bees do remain and make their Honey-combes (as Elianus faith) in the Mountain Ida. Thus much of the differences of Bees : now it remaineth to discourse of the Politick, Ethical, and Occonomick vertues and properties of them.

Bessee governed and do live under a Monarchy, and not under a tyrannical State, admitting and The governreceiving their King, not by succession or cashing of lots, but by respective advice, considerate judge-ment of Bees, ment, and prudent election; and although they willingly submit their necks under a Kingly government, yet notwithstanding they still keep their ancient liberties and priviledges, because of a certain Perogative they maintain in giving their voices and opinions, and their King being deeply bound to

them by an oath, they exceedingly honour and love.

- The King as he is of a more eminent stature, and goodly corporature (as before we have touched) then the rest: so likewise (which is singular in a King) he excelleth in mildness and temperatenesof behaviour. For he hath a sting, but maketh it not an instrument of revenge, which is the quethat many have thought their King never to have had any. For these are the laws of nature, not written with Letters, but even imprinted and engraven in their conditions and manners: and they are very flow to punish offenders, because they have the greatest and Soveraign power in their hands. And although they seem to be slack in revenging and punishing private injuries, yet for all that they never suffer rebellious persons, refractorious, obstinate, and such as will not be ruled, to escape without punishment, but with their pricking stings they grievously wound and torment, fo dispatching them quickly. They are so studious of peace, that neither willingly nor unwillingly they will give any cause of offence or displeasure. Who therefore would not greatly be displeased with, and hate extreamly those Dienzsian Tyrants in Sicilia, Clearch in Heraclea, and Apollodorm the Theef, Pieler and Spoiler of the Cassandrines? And who would not detect the ungratiquiness of those lewd claw-backs, and Trencher-parasites, and slatterers of Kings, which dare impudently maintin. that a Monarchy is nothing elfe but a certain way and rule for the accomplishing of the will, in uling their authority as they lift, and a science or skilful trade, to have wherewith to live plealantly in all fenfual and worldly pleasure: which ought to be far from a good Prince, who whilest be would feem to be a Man, he shew himself to be far worser then these little poor winged creatures. And as their order and course of life is far different from the vulgar fort, fo also is their birth; for they of the Kingly race are not born after the manner of a little Worm, as all the Commimky are, but is forthwith winged, and amongst all his younglings; if he finde any of his fons to be either a fool, unhandsome, that none can take pleasure in, rugged, rough, soon angry, sumits or too teasty, ill shaped, not beautiful or Gentleman-like, him by a common consent, and by a Parliamentary authority they deftroy, for fear left the whole Swarm should be divided and distracted into many mindes, and so at length the Subjects undone by factions, and banding into

The King prescribeth laws and orders to all the rest, and appointeth them their rules and meahro; for some he straightly chargeth and commandeth, (as they tender his favour, and will wood his favour believe to would his displeasure) to setch and provide water for the whole Camp. He enjoyneth others to to recent and provide water for the house well and cleanly, to finish perfells the Honey-combes, to build, to garnish, and trim up the house well and cleanly, to finish perfells the Honey-combes, to build, to garnish, and trim up the house well and cleanly, to finish perfelly the work, to finde and allow, to promote and fnew others what to do. Some he fenderh

forth to feek their Wring, but being worn with years, they are maintained at the common flock forth to feek their kiving, but being worn with years, they are an antitude at the common flock at home. The younger and ftronger being appointed to labour, and take their turns at they fill at home. The younger and ftronger being appointed to labour, and take their turns at they fill and although (being a King) he discharged and exempt from any mechanical business, yet for all that they will buskle himself to his task, never at any time taking the field of air thinks in case of middle himself to his task, never at any time taking the field of air thinks. that, incase of necestry ne will busine ministration of the cannot otherwise chuse, by means of fine unabroad, but either for his healths sake, or when he cannot otherwise chuse, by means of fine unabroad, but either for his healths sake, abroad, but either for his seatins take, or which and frong, then like a Noble Captain he march, geht buffnels. If lilrefpect of his years he be lufty and frong, then like a Noble Captain he march. will the be carryed of his Souldiers, unless he be webried and weakened by means of crooked age. will he be carryed or his Sounders, unless he be wealest fickness; fo that he can heither standarhis by mattered and clean put out of heart, by any violent fickness; fo that he can heither standarhis he mattered and clean put out of heart, by any violent fickness; fo that he can heither standarhis he mattered and clean at token being given by his hone pipe, or the control of the can be control of the control of the can be control of the control of the can be can be control of the can be control of the can be control of the can be lege, nor flie. When night approacheth, the ngn and token being given by his Honey pipe, of Cornet, (if you will so call it) a general Proclamation is made through the whole Hive, that every Cornet, (if you will so call it) a general Proclamation is made through the whole Hive, that every like all being the himself to reft, 'fo'the watch being appointed, side all things set in order, they will be the King liveth, so long the whole whole while will be make themselves ready and go to bed. So long as the King liveth, so long the whole while will be the himself of peace, leading their lives without any disquieting, disturbance, 'vexation, of future wars. For the Drones do willingly contain themselves in their own cells, the elder living of suture wars. For the Drones do willingly contain themselves in their own cells, the elder living of suture wars. of future wars. For the Drones do winingly contain the interest in the contents of their own homes, and the younger not daring for their ears for break into their factorists. The king their Lands, or to make any invodes or invasion into the house of their whole Palace, his lodging being keepeth his Court by himself, in the highest and largest part of the whole Palace, his lodging being keepeth his Court by himself, in the highest and largest part of the whole Palace, his lodging being workmanlike and very cunningly made of a fine round or enclosure of Wax, being this as it were fenced and paled about as with a defentible wall. A little from him dwell all the Knigschilwere tenced and paren about as with a determined. Their King being dead, all his subjects in an up. rore, Drones bring forth their young in the cells of the true Bees, all are in a hurly burly, all be rore. Drones oring forth their young in the that Bees have many Kings, which I would rather ingott of feafon and order. Arifotle faith, that Bees have many Kings, which I would rather ing out of featon and order. Aristotle fatth, that Dees have many kings, which I would rather tearm Viceroys or Deputies, fithence it is certain (as Antigonus affirmeth) that as well the furings do die and come to nought, by having of many kings, as none at all. And thus to have fooken of good Kings let this fuffice. Evil kings are more rough, rugged, browner, blacker, and of more fundry colours: whose natures and dispositions you will condemn, in respect of their habit and manner of body and minde, the one and other are thus Physiognomically described by the Poet;

Nama; dua regum factes, duo corpora gentie. Alter erit maculis auro squallentibus ardens, Er rutilis clarus Squamie, infignis Gore. Fadior est alter multo, quam pulvere abacto

Quum venit & fico tertam spuit ore venator : Desidia latamque trabens inglorius alum-lime Dede neci, melior vacua fine requet in aula.

In English thus; The two aspetts of Kingly Bees, two Nations do disclose, One of them, Golden foited red, burning with pale bew . And having scales buthred and clear, and great about the nose, The other fillby to behold like duft, for it is true, Which hunters fpit upon dry land, when all is crusht and prest, In floth belly broad, doth travail worfer then the leaft, Him kill, let the other raign Alone, in empty Court, de not disdain.

And thus hitherto have we spoken of their Kings and Dukes: now will we bend our discourses the common fort of Bees.

Bees are neither to be accounted wilde, nor altogether calm and quiet creatures, but of a nature betwixt both : and of all other they are esteemed most serviceable and profitable. Their sling givesh both life and death to them, for being deprived of it, they furely die : but having it, they repellal bofility from their fwarms. Of these there are none idle, although they be not all Honey-makers, no ther are the most sluggish of them all, like unto the Drones in their inclination and manneys: For they do not corrupt and mar the Honey-combes, neither do they lie in wait by treachery and deceit to filch Honey, but are nourished by flowers, and flying forth with their fellows, do get their living with them; although some of them want the skill to make and lay up the Honey finely and fafely, yet notwithstanding every one hath his proper charge and business to use and practile; for these bring water to the King, and to the older Bees that cannot travail.

The elder fort if they be of a strong and robustious constitution, are chosen for the guard of the Kings person, as the fittest persons to be about him, in respect of their approved worth, sight dealing, and uprightness of conscience, for the ordering and disposing of all matters. Some gut Phylick to those that are lick, by making and giving to them a medicinal alliment of Honey that drawn from Anife, Saffron and Hyacinthes. But if any through age or fickness chance to die then by whose office it is to carry forth the dead bodies to burying do forthwith flock together carrying dead body of the barbar dead body of their brother on their shoulders, as it were on a Beere, lest the pure Honey tooks might be tainted with any uncleanliness, stink, or nastiness,

Bees have also their Ambassadours and Oracors, sent with Commission or authority, and ret in truft to deal in their Princes affairs, their old Beaten Souldiers, their Pipers, Trumpount Horn-winders, Watchmen, Scout-watches, and Sentifiels. Likewife Souldiers ever int readinesse to defend, and look to their Hony-wealth and goods, as if it were a City committed to their trust and valiancy, and these do punish, torment, and throw to the ground all flying Theeves and Worms, that dare invade secretly by any cunning passage, or mine into their mansions. And that they might bear the world in hand, that they are no privy or fecret Theeves in their flying, they they might bear the mying, which together with their flight, is heard both to begin and end: which found, whether it proceedeth from the mouth, or from the motion of their wings, Arifolie and Hejebins do much vary and contend.

Their Pipers and horn-blowers do edere Zirgen, as Helychim faith (the Englishmen term it Sing) and that they make to be the watch-word and privy token, for their watch and ward, sleep, and daily labour. They love their King fo entirely, that they never fuffer him to goe abroad alone, but daily labour. They love their king to entirely, that they never fuller film to goe abroad alone, but their Army being divided into two parts, and by heaps winding themselves round, they do as it were enclose and sence hith on all sides. If in any journey the King hap to wander from his company, and cannot be found, Being driven away by the force of some stormy windes or weather; pany, and cannot be read a privy fearch, and with their quick-fenting, perfue and follow the chafe follong, until he be certainly found; and then because he is tyred with flying, and the tedious-nels of tempess, the common fort lift him upon their wings, and fo triumphantly convey him home as it were in a Chariot. But if he die by the way, then they all mournfully depart, every one to his own place separating themselves, or peradventure for a while, they work up their Honeycombes not yet finished, but never make any more Honey; So that at length, growing to be lazy, fickly, wasted, confumed and distained with their own filth and corruption, they all miserably perih. For they cannot possible live without a King, against whom, none is so hardy as to lift up his finger to offer him any violence, much less to conspire his destruction, unless he (after the fashion of Tyrants) do overthrow and turn all things upfide down, after his own will and luft, or neglecting carelessy the Weal publique, setteth all upon fix and seaven. Yea, if he accustom himself to go often abroad, (which he cannot do without the great hurt and prejudice of his Citizens) they do not by and by kill him.; but they take from him his wings, and if he then amend his life and look better to his office, they fingularly affect and honour bint.

When the King by flying away hath left his Bees, they fetch him again, and being a fugitive from his Kingdom; they follow him amain by his fmell, as it were with hue and cry, (for amongst them all the King smelleth best) and so bring him back to his Kingly house. None dare venture out of his own lodging first, nor seek his living in any place, except the King himself first going forth, do dired them the way of their flight. For I am hardly of Ariffolles minde, who affirmeth that the King the tentile way of their inguit. Lot value active of any office in feldom feen. But if by reason of its tyranny, truelty, and violent rule, they be forced to feek some other dwelling places, then a sew days before the time appointed, there will be heard a folitary, mournful, and peculiar kinde of voice, as twee of some trumper; and two or three days before they flie about the mouth of the Hive; anywards some transper, and two of three days before they me about the mouth of the lave, and sill the Tyrant (whom they left behinde) if he attempt to follow them. But a good King they new reforake, and if at any time he pine and fall away by reason of sickness, any plague, or murrain. orthrough old age, all the meaner fort do make mone, the whole rout and multitude of Senators and Aldermen do greatly bewail him, not conveying any meat into their Hives, nor yet looking out ofdoors for meer grief, filling the whole house with forrowful hummings and laments, and gathering themselves by heaps about the carkass of the dead King, they do with great noise tragically mouth for him. Neither doth continuance of time-mitigate or take away their grief, but at length all of the faithful friends, partly through grief; and partly through famine, they are clean consumed and brought to death.

Whilest they have a King, the whole swarm and company is kept in awful order, but he being gone, they go under the protection of other Kings. They have not many Kings at once, neither can they endure unipers, overthrowing their houses, and rooting out their flock and samily. And if in the she warm there be two Kings; (as sometimes it falleth out) then one part adhereth to the one king, and the other fide cleavether the other, to that fometimes in one hive you shall finde Honey. oubts of fundry forms and fashions: where they behave themselves so honestly and neighbourly. that the one meddleth not with the others charge and bufinels , having no minde to enlarge their Espire, to entire, draw, or win by fair means the fubjects of the other fide, but every one being sedient to his own King without contradiction. They honour him to highly, that being loft they complain; being decrepit, they preferve and keep frim; being weary, they carry him round about with them; being dead, they bewail him with all flineral pomp and heaviness, yeelding up at length statheir very liver for an affuramed of their loves and faithful dealings. Oftentimes they arrear deadly war against strangers born, for the Honey that they have stoln from them, as for the catching ing and marching ap afore hand those flowers whereon they purioled to fit on ? fo that sometimes the quarter is determined by dint of fword in a just battast. Offentimes again they wrangle about ther they combes and dwelling tiouses, but then the deadly and in apprealeable war is, when the boxenion is about the life, crown; and dignity of their King, for then they belir hemselves most agerly, defending him most valiantly; and receiving the darts of stings that are bended against him, with an undanted courage, by the voluntary and thick interpolaring of their own bodies, between the

Neither are Bees only examples to men of Political prudence and fidelity, but also presidents for Neither are Dees only examples to the For whereas Nature hath made them Zooa agelaia, that is, creatures living in companies and fwarms, yet do they all things for the common good of their own rout and multitude, excepting ever the Drones and Theeves, whom if they take tripping in the man. ner, they reward with condign punishment. Their houses are common, their children common, their ner, they reward with conners and their countrey common. They couple together without question as laws and tratutes common, and their country country which whether it proceed of modely, or be done Camels do, privily and apart by themselves, which whether it proceed of modely, or be done Camels do, privily and apart by themserves, which with the dispute and quaint resolution of those through the admirable instinct of Nature, I leave it to the dispute and quaint resolution of those through the admirable initiated of values and cognizances of learning, do not flick to affirm grave Doctors, who being lauch neven by their own wits, of all the causes in nature, though never so obscure, hid and difficult.

opicure, mu and dimensions.

Flies and Dogs do far otherwise, whose impudency is such, that having no regard of times, persons. or places, they will not give place, or be disjoyned. Yea the Massagets (as Herodam writeth) ha. or places, they will not give place, or be also your dealt with their wives very unfeafonably, and though ving their quiver of arrows on their carts, they dealt with their wives very unfeafonably, and though ving their quiver of allows of their early, and there which is worfer, this beaftly la. thion is crept amongst the usurpers, or at least professors of the Christian name, who shame not openly to kis and embrace, yea even to play and meddle with filthy whores and brothelly quent, openiy to an and anti-condemn these kinde of people of beastial impudency and wanton shamelesses; or caufing them to blush if they have any grace, will teach them repentance. Neither are they aloge. ther fuch creatures as cannot endure or away with musick, (which is the Princess of delights, and the delight of Princes) as many unlearned people cannot, but are exceedingly delighted with tune in

any harmony wherein is no jarring, so the same be simple and unaffected.

And although they have not the skill to danne according to due time, order and proportion in Musick, as they say Elephants can, yet do they make swifter or slower their slight, according to the Trumpetors minde, who with his sharp and shrill found causeth them to bestir themselves more speedily; but beating slowly and not so loud upon his brasen instrument, maketh them more slow. and to take more leisure. Neither hath Nature made them only the most ingenious of all living creatures, but by discipline hath made them tame and tractable. For they do not only know the hand and voice of the Honey-man, or him that hath the charge and ordering of the same, but they also suffer him to do what liketh him best: which every man must needs confess to be an argument of a generous and noble disposition, thus to undergo the rule of their Over-leers and Surveyors, but the hand and discipline of a stranger they will by no means endure.

As for economical vertues they excel alfo, and namely for moderate frugality and temperance not profulely and prodigally wasting and devouring the great store of Honey which they guthered in the Summer feafon, but they fuftain themfelves therewith in Winter, and that very faringly t And so whilest they feed upon few means, and those of the purest fort, they purchase long life, (the reward of sobriety.) Neither are they so niggardly and sordidous minded, but when as they have gathered more Honey then their number can well frend, they communicate and impartionevery liberally amongst the Drones. As for their cleanliness these may be certain arguments, that they never exonerate nature within their hives, (except constrained thereto by some sickness, foul weather, and for some urgent necessity) that they convey away the dead carkasses, that they touch no rotten nor flinking flesh, or any other thing, no herb that is withered, nor no ill sening or de-

They kill not their enemies within their hives, they drink none but running water, and that which is throughly defecated: they will not dwell in houses impure and foul, fluttish, black, or full of any feculent or dreggy refuse, and the excrements of the labourers and fickly, they gather on a heap without their pavilions, and affoon as their leifure ferveth it is carryed clean away. Concening their temperance and chaftity, (although it hath been partly touched before,) yet this I will so, that it is wonderful what some men have observed. For whereas all other creatures do coupleints open fight of men, the Elephant only excepted, and Wasps likewise not much differing in kinds, do the fame : yet Bees were never yet feen fo to joyn together, but either within their hives very modefly they apply themselves to that business, or elseabroad do it without any witnesses. And they are no les valiant then modeft and temperate, Dum corpora bello objectant, pulchramque petun per vulnera motem. Their war is either civil or forain. Of the former there be divers causes, that is to fay; the multitudes of their Dukes or Captains lying in wait to betray both King and Kingdome fearfity of victual, ftraightness of place and rooms corruption of manners and idleness. For if they have no Dukes, then it is expedient (as other whiles it happeneth), they ftay the, overplus, jeft ithe number of them growing too great, either violence wight be offered to the King, or the Common drawn to some sedition.

They kill them most of all, when as they have no great store of young Bees to plant any stered lonies, overthrowing and spoiling withall their Honey-combs (if they have any.) They execute the Theeves and Drones, so often as they have not room enough to do their business in, (forther business in)) the more inward part of the Hive,), to taking from them at one time, both their Honey combine meat. The scarsity and lack of Honey, causeth them, also to be at deadly feud, so that the flort ho do encounter the long with might and main, In the which highering, if the fhort be Conqueron, it will be an available with might and main, it will be an excellent Swarm, but if fortune fmile on the long Bees fide, they live idlely, maing or ver any good Honey. Whosoever getteth the day, they are so given to rapine and re-

yenge, as they take no prisoners, nor leave any place to mercy, but commit all to the sword. Now concerning their forain wars, I must say they give place to no other living creature, either in fortitude, or hardy venturing: and if either men, four-footed beafts, birds, or Wasps, do either in fortitude, or kill any of them, fo that they be not well contented against all these they oppose themselves very stoutly, according to their power wounding them. They hate extreamly adulterous persons, and such men as be smeared with any Ointment, those that have curled or crisped harr. (as allo all unfaithful and bale raskally people) and all those that wear any red clothes of the colour of bloud: as contrariwife they love and reverence exceedingly their Maiters, Keepers, Tutors. Deof bloud: as to that fitting upon their hands, they do rather tickle and lick them in forting wife, then either wound or hurr them, though never fo little with their sting. Yea in footing wite, their ettered without any fouch of flutt, and without any covering to their lands, gather together the swarms in a very hot Summer; yea, handle, place them in order, heap up together, fit or stand before their Hives, and with a tick take clean away Drones, Theeves, Wasps, and

ornets. If any Souldier loseth his sting in fight, like one that had his Sword or Spear taken from him, he prefently is discouraged and despaireth, not living long, through extremity of grief. Going forth into the field to fight, they stay till the watchword be given, which being done, they flock in great heaps about their King (if he be a good one) ending all their quarrell in one fet battel. In their order of fighting, how great vertue, courage, strength, and nobleness these poor creatures shew, as well we our ing, now Beautifie, and they better who have affured us by their writings, that whole Armies of armed men have been tamed by the stings of Bees, and that Lions, Bears, and Horses, have been slain by means of them. And yet (how fierce and warlike foever they feem to be,) they are appealed and made gentle with continual or daily company, and unless they be too much netled and angred, they live peaceably enough without any great trouble, never hurting any one maliciously or deceit-fully, that standerh before their Hives. If I should go about to declare at large their ingeny, natural inclination, cunning workmanship and memory; I should not only give unto them with Vingil: Periculam aura divina, but alfo bauftu mentia etherea, and (liccat Pythagorice errare,) the Mempfeboofs of that ingenious Philosopher. For after that they are inclosed in a clean and a sweet hive, they gather out of gummy and moist liquor, yeelding trees a kinde of glutinous substance, thick. clumy and tough, (called of the Latines, Campie, and of the Greeks, Mitys,) especially from Elms Willows, Canes or Reeds, yea even from itones; and this they lay for the first foundation of their work, to covering it all over as with a hard crust at first, bringing to it afterwards another layer of Pisane, which is a kinde of juyce of Wax and Pitch, made with Gum and Rosin, and over that again they lay Propolie, which we call Bee-glew.

Inthisting three-fold tille, and fure ground-work thus artificially begun, they do not only laugh to form, jeft at, and mock the eyes of the over-curious fpechators of their Common-wealth and works, but that which no man confiders, they do hereby defend both themselves and theirs, against dain, cold, small vermin and beafts, and all their enemies. Then after this they build their Combes, with fichan Architectonical prudence, that A chimedes in respect of them seems to be no body. For first of all they fet up the cells of their Kings and Princes in the higher place of the Honey combes, being ling, fair, fumptuous, flately and lofty, being cunningly wrought, of the most tried, purest and refined Was, trenching them round for the greater defence of the Regal Majelty, with a mound and en-

closure as it were with a strong Wall, Bulwark, or Rampire.

And as Bees in regard of their age and condition, are of three forts, to likewife do they divide their Cells: forto the most ancient they appoint houses next to the Court, (as those that are the fittest to be of his privy Councel, and guarders of his Person) next to the sare placed the young Bees, and those that he but one year old. And they of middle years and stronger bodies, are lodged in the utitermol rooms, as those that are fittest and best able to fight for their King and Country. Yet Artflute faith, that Bees in the making of their Tents or Cells, do first of all provide forthemselves and next for their King and his Nephews, and lastly for the Drones, And as in the fabricature of their Honey-combes, they make the fashion according to the magnitude and figure of the place, fashioningit either orbicular, long, square, sword-like, or foot-like, or according to their own living, running out sometimes in length eight foot; so their little Cells contrariwife are framed after a cerunformina Geometrical proportion and measure; for by tule they are justly Sexangular, and case pible enough to hold the tenant.

The whole Combe containeth four orders of Cells; she first the Bees occupy; the next the Diones possels; the third, those that are called of the Greeks, Chadoones; of the Latines, Apum bili, (call them if you please Schadones;) The last is appointed for the room of Honey-making. There be some who constantly aver, that the Drones do make combes in the same hive the labouring Bendo, but that they lack the skill and power of mellification, it being uncertain whether this comes to pass either through their groffeness and big-bellied fatness, or through their setled and natural laziness. And if through the weightiness of the Honey the combes begin to Make and wag, and to lean and bend as though they were ready to dall, then do they rear them up, and under-prop them with pillars made Arch-wife, that they may the more readily dispatch their bufiness, and execute their charges, (for it is necessary that to every combe there be a n in Marine en en en e<mark>n rig e</mark> en en anace est est de La seul a gradia a la la seul de la calegaria.

In some places, as in Pontus, and in the City of Amiljus, Bees make white Honey, without and combes at all, but this is feldom feen. And if a man would confider the rare and admirable contex. compes at an, but this is returned teen. And the standard the stand conceit, who would not ture and fabrick of their Honey-combes, far excelling all humane Art and conceit, who would not fubscribe withthe Poet, Effe Apibus partem divina mentis, & bauftu eiberees? who will deny them (I fublication with the poet, the apromy serious atoms and forme certain glimple of reason? But I say either imagination, fantasie, judgement, memory, and some certain glimple of reason? But I will not dispute of this, neither am I of Pythagoras minde, who contented that the fouls of wise men, and of other ingenious creatures, departed into Bees. But who lover will diligently examine how and of other ingenious creatures, departed into bees. But which is a significant the combes, fome to gather Honey, to heap together their meat, to trim and drefs up the houses, to cleanife the common draught, to under flore the mitheir meat, to trim and dress up the nouses, to clean the country to draw out the very firength of nous walls, to cover those places wherein any thing is to be kept, to draw out the very firength of the Honey, to digest it, to carry it to their cells; to bring water to the thirsty labourers, to give the Honey, to digent it, to carry it to then cens, to bring wash their King with furth over-light food at fet and appointed hours to the old Bees that fit to defend their King with furth over-light and painful regard, to drive auto Spiders, and all other ene mies; to carry forth the dead, (that no and painful regard, to drive away spiders, and an other the first own proper cell, and generally, all of them flink or ill favour hurt, every one to know and go to his own proper cell, and generally, all of them not to ftray far from home to feek their living; and when the flowers are spent neer their lodging, not to ftray far from home to feek their living; and when the flowers are spent neer their lodging, to fend out their espials to look for more in places further distant, to lie with their faces upward to lend out their elphane to look for thany toyage by night, left their wings being much motunder the leaves when they have fet forth any toyage by night, left their wings being much motunder the leaves when they have fet forth any toyage by thened by the dew, they should come tardy home the next day; to ballance and poyle their light bo. dies with carrying a stone in stormy weather, and when there is any whirl-winde, to sliconthe further fide of the hedge , for fear left either they might be diffurbed, or beaten down by the booffe rous violence thereof. Whosoever (I say) will duly confider all this, must need confess, that they observe a wonderful order and form in their Common wealth and government, and that they are of

a very strange nature and spirit. I had almost omitted to speak of that natural love which they bear to their young, a great vertue and feldom feen in the parents of this age. For Beer to fit upon their combes (when they have laid their increase) almost like unto birds; heither will they fir from thence but in case of pinching hunger, returning out of hand to their breeding place again, as though they were affaid left that by any long stay and absence, the work of their little cell might be covered over by some Spider web. (which often happeneth) or the young by taking cold might be endangered. Their young ones be not very nice or tender, nor cockeringly brought up, for being but bare three division, at foon as ever they begin to have wiring they enjoynthem their task, and have an eye to them that they be not idle, though never to little. They are to excellent in divination, that they evented aforeband; and have a sense of rain and cold that is to come, for their (even by Nature infinite) they flie not far from home: and when they take their journey to leek for their rebid; (which appear done at any set and ordinary title; but only in fair weather) they take pains commissly and diligently without any stay, being laden with such pleatey of Honey that oftentimes being out was riad, they faint in their return to their own private cottages, not being able to attain them. And bascaule fome of them in legard of their roughness are unfit to labour, by rubbing their bodies against stones and other hard matter they are smoothed; afterwards addressing themselves not south to their bodies and the stoness and before hard matter they are smoothed; afterwards addressing themselves not south to their bodies. Apply to their busides. The younger fort befur them right doubterly without dorstolinging to the live all that is needful. The clder took to the family, placing in die order that Hollow which is gathered and wrought by the middle aged Bees. In the morning they be all very filent, all one of them awaken all the reft with his thrice humming noise, every one building himself about his own proper office and bharge. Returning at night, they are as it were in an improve a the fifth and service they make a little must write a minimum of the reft with in the must write an interpretation of the minimum of the reft with in the must write an interpretation of the reft with office. Aer that they make a little muttering or mutmuring among themselves; until the philips office appointed for the section of the watch, by his flying round about, and his fort and gentle nois, doth as it were obvertly and privity thange them in their Kings name to prepare the file lives to ref and fo this token being given, they are as filent as fifties, fo that laying ories ear to the moth of the hive, you shall hardly perceive any the least notice at all: fo dutiful they are to their king, Officer, and Rulers, reporting themselves wholly in his books, favour, and pleasare and now War short of their excellency and ufe. Is obn angum

Mhereas the Almighty hath created all things for the use and service of Man; to effectify thing the rest hath he made Bees, not only that they should be unto us patterns and president of political and president of political and president of the control of the c cal and economical vertues. (of the which before I have difcourfed) ibuteven Teacher and shool mafters instructing us in certain divine knowledge, and like extraordinary Prophets, we months ting the fuccels and event of things to some. For in the years 90/98; 473; 208 before the birth of our bleffed Saviour, when as great fwarms of Bees, lighted in the publique and Orling her, up on the houses of private Citizensy and the Chappel of Mary, many confipiracies and ittelors were intended against the State at Rome; with which the Common wealth was welnight detried, in fnared, yea and overshelden, will the days of Several the Emperour, Bees made ther control the Philipper the Enlignes, banners and flandards of the Souldiers, and most of sill in the camp of fine, and which and did the camp of the which enfued divers conflicts betwire the Armies of Severise and Wight. Fortune for a cinici man ting her favours equally to been both, but at length beings fide carryed away the Buckler Swam of Bees also filed the Severise and the carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise fide carryed away the Buckler Swam of Bees also filed the Severise filed to the Severise filed the Severise filed to the Severise filed the Severise filed to the S of Bees alfo filled the Statuaes which were fet up in a lifetruria, representing ditional Planting and the statuaes which were fet up in a lifetruria, representing ditional Planting and the statuaes which were fet up in a lifetruria, representing ditional planting and the statuaes which were fet up in a lifetruria, representing ditional planting and the statuaes which were fet up in a lifetruria, representing ditional planting and the statuaes which were fet up in a lifetruria, representing different planting different p that they fell in the camp of Caffin and what hully builtes after that followed, Julius Caffin and resolve well. resolve you. At which time also a great number of Romans were intrapped and sainby and bull of Gormans in Community in Com bush of Germans in Germany, P. Fabius and Q. Elius, being Consuls. It is written that a fished

lighted in the tent of Hoftilius Rutilius, who was in the Army of Drufus, and did there hang after fucha manner, as they did enclose round his Spear which was fastened to his Pavilion, as if it had been a rope hanging down, M. Lepidui and Munatius Planew being Confuls. Also in the Consul-hip of L. Paulus and Guim Metelus, a swarm of Bees-flying up and down, prefignified the enemy at hand as the Soothfayers well divined Pompey likewife warring against Cafar, when for the pleafuring of his friends he had fet his Army in aray, going out of Dyrrbachium, Bees met with him, and darkened even the very Ancients with their great multitude. We read in the Histories of the Helvetians, how that in the year of our Lord God 1385, when Leopold of Austrich prepared to go against Sempach with an Host of men, being yet in his journey, a swarm of Bees fled to the Town, and there reflectupon a certain great Tree called Tilia; whereupon the vulgar fort rightly foretold the coming of fome frange people to them. So likewife Virgit in the seventh Book of his Eneids, seemeth to describe the coming of Eneas into Italy after this manner.

Lauri Huim Apes summum densa (mirabile diclu) Stridore ingenti liquidum trans atbera vette Obfidere apitem, et pedibus per mutua nexis

Examen subità ramo frondente pependit. Continud vates : examen cernimus (inquit) Adventare virum.-

That is. A tale of wonder to be told, there came a swarm of Bees, Which with great noyfe within the air a Bay tree did attain, Where leg in leg they cleaped fast, and top of all degrees O're-spread, and suddenly a bive of them remained There banging down : whereat the Prophet faid, Some stranger here shall come to make no all afraid.

Which thing also Herodotus, Paufanius, and divers other Historiographers, have with greater obfervation then reason confirmed. Laon Acraphniensis, when he could not finde the Oracle of Trotheniss, by a swarm flying thither he found the place. In like fort, the Nurses being absent, The nin Melitam, Hiero the Syracusan, Plato, Pindarm, and Ambrosim, were nourished by Honey, which Bessbylittle and little put in their mouths, as Plutarch, Paufanias, and Textor are Authors. Xensthe likewise in his Oeconomicks, termeth Honey-making the Shop of vertues, and to it sendeth mothers of Housholds to be instructed. Poets gladly compare themselves with Bees, who following Nature only as a School-mistresse, useth no Art. So Plato faith, that Poets ruled by Art, can never perform any notable matter. And for the same reason Pindarus maketh his brags, that he was superior to Bacchilder, and Simonides, having only Nature, not Art to his friend. Bees unlesse they be incensed to anger, do no hurt at all, but being provoked and stirred up they sting most fairply: and fuch is the disposition and naturall inclination of Poets; and therefore in his Mino findly enjoyneth, that those who love their own quiet, must take great heed that they make no warseither with Poets or Bees. Finally, they have fo many vertues which we may imitate, that the Egnians, Chaldeans, and Grecians, have taken divers Hieroglyphicks from them. And he that will read over Pierius, shall there finde ftore of Emblems of them.

The Countrey people in like manner have learned of them Aeromanie, that is, Divination of things by the air, for they have a fore-feeling and understanding of rain and windes aforehand, and doughtly 'prognosticate of storms and foul weather; So that then they five not far from their own homes, but sustain themselves with their own Honey-suck already provided. Which beingtrue, we must then think it no strange matter? that Arifleus, Philiftius, Ariflomachus Solenfis, Memethe Sammite, and fix hundred others that have writ of the Nature of Bees, bidding adiew to all those pleasures and delicacies that are found in Cities, for fifty and eight yeers space together, inhabited the Woods and Fields, that they might more exactly come to the knowledge of their order of living, and naturall dispositions, leaving it as a monument for posterity to imitate. But what their bodies do work in ours, I judge worth the labour and pains taking to let you underfand, that we may be affured there is nothing in Bees, but maketh to the furtherance of our bealth and good.

First therefore, their bodies being taken newly from the hives and bruised, and drunk with fome Medicinal uses duretical wine, cureth mightily the Dropfie, breaketh the stone, openeth the obstructed passages of the Urine, and helpeth the suppression thereof. Being bruised, they cure the wringings and griping of the belly, if they be laid upon the place affected : and if any have drunk any poylonous Honey, Bees being likewise drunk do expell the same. They mollifie hard ulcers in the lips, and being bound to the part, they cure a Carbuncle and the Bloody-flixe, amending also the crudity of the homack, and all spots and flecks in the face, being tempered with their own made Honey; as both Hollerius, Alexander, Benediaus, and Pliny have written.

Gelen affirmeth, that if you take live Bees out of their Combes, and mix them with Honey wherein Bees have been found dead, you shall make an excellent Oyntment to be used against the hedding and falling of the hair in any place of the head, caufing it to grow again, and come afresh Impagin willeth us to burn many Bees, commixing the affees with Oyl, and therewith to anount the b ld places; but we must (faith he) take great heed that we touch no other place neer adjoyning. Yea, he affirmeth, that Honey wherein is found dead Bees, is a very wholfome medicine,

The uft of

ferving

ferving for all diseases. Ergin, cap. 61. De marb. muliebrib. commendeth highly, the ashes of Bees beaten and tempered with Oyl, for the dealbation of the hair.

aten and tempered with Oyl, for the deanest living creatures are nourified, by, and do feed full Bees also are very profitable, because divers living creatures are nourified, by, and do feed full Bees also are very profitable, begause givers having creatiness are noutiness, by, and do feed full favorly on their Honey, as the Bear, the Badger or Brock, Lizards, Frogs, Serpents, the Woodpecker or Bar-bee, Swallows, Lapwings, the little Titmouse, which of some s, called a Nunne, because his head is filletted as it were Nun-like, the Robin-red-breast, Spiders, and Wasps, as Bellonim

hath well observed.
But to what end (you will lay) serveth their sting, against whose poyson Plyn knew no remedy) But to what end (you will say which cannot be denyed, that the lings of Bees are fometimes I must need contene trues that when either they are mad and raging, and be exceedingly diquieted by venemous, but that is when either they are mad and raging, and be exceedingly diquieted by wenemous, out that is when the saver, for otherwise they do not sting but prick but a little; means of anger, or some vehement Feaver, for otherwise they do not sting but prick but a little; means or anger, or loud venement and mention of the stinging of Bees, supposing it very unmeet for and therefore Disjournes never made matter as the fling of a filly Bee. But yet they have fur a man to complain of fo fmall a matter as the fling of a filly Bee. But yet they that have fur. a man to complain of 10 man a matter as the thing of as companions and effects of their maceded him, have observed pain, rednesses, and swellings, as companions and effects of their malice, especially if the sting do stick in the sless, which if it do very deep, then death hath sometimes lice, especially if the sting do stick in the sless, which if it do very deep, then death hath sometimes followed, as Nicander writeth in his Theriacis. In like manner the people of the old World (that followed, as Nicander writern in as Ineriacu. In the manner the people of the old World (that we may prove the sting of Bees to be converted to some good use) did (as Suldas writeth) punish those persons who were sound guilty of cousenage, and deceitful counterfeiting of merchandize after this sort: First, they stripped the offender stark naked, anoynting his body all over with Holling the sound share the sound share her bush to be a sound share her bush the same her bush to be a sound share her bush the same her bush to be a sound share her bush to be a sound atter this lott. Firm, they have open Sun with his hands and feet fast bound, that by this means being ney, then setting him in the open Sun with his hands and feet fast bound, that by this means being ney, then fetting that a tree open sun in the sun, he might endure punishment, pain, tormented with Flies, Bees, and feorching beams of the Sun, he might endure punishment, pain, and death, due to his lewd and wicked life. With which kinde of punishment and torture, the and death, due to his love the poor naked Islanders of America at this day, (now called the West. Indies) who are under their rule and government, not for justice sake, (as those Ancients did) but for fatisfaction and fulfilling of their barbarous wills, and beaftly tyranny, that they might feem to be

more cruell, then cruelty it felf.

Nonius faith, that if the herb Balm (called Apiastrum) be beaten, and anounted with Oylupon the Ringed place, that there will enfue no hurt thereby. Florentim counfelleth the gatherer of Ho. ney, to anount himself with the juice of Marsh-mallowes, for by that means he may safely and without fear take away the Combes. But the juice of any Mallow will do as much, and specially if it be mixed with Oyl; for it Both preserveth from flinging, and besides it remedieth the hipged But admit that Bees by their flinging do vexe and difeate us, yet notwithfunding the dead Bees for found in the Honey do speedily bring cure to that hurt, if they be duly applyed, abating and king away all the pain and poyson. What should I say? No Creature is so profitable, none less fumptuous. GOD hath created them, and a little money and cost will maintain them, and mall provision will content them. They live almost in all places, yea, even in Forrests, Woods, and Mountains; both rich and poor by their good husbandry do gather good customs and pensions by them, they paying (as all men know) very large rents for their dwelling houses; and yet for all their tribute they pay, a man need neither keep one fervant the more for the gathering of it, nor fet on por the oftner. Merula faith, that Varro gathered yeerly five thousand pound weight of Honey: and that in a small Village of Spain, not exceeding one acre of ground, he was wont to gainly hency there gathered, ten thousand Sesterties, which is of our English Coyn about filty pounds. Wo are furnished also out of their work-houses or Shops, with Waxe, Sandracha, Bee-glew, Combs, and dregs of Wax, which no Common-wealth can well spare. To speak nothing of the examples of their vertues and noble properties, being no leffe, wholfome for the foul, then there others are for the good provision and maintenance of our life, and for nourishment of our bodies necellary Now for the conservation of Bees, it is very meet (as Pliny writeth) that we come by them lawand commodious.

fully, and by honest means, that is, either by gift, or by buying of them; for being taken away by theft, they will not prosper with us a even as the hearb called Rue being stolne, will very bardly or never grow. Furthermore, to keep these good pay-masters, and to make them in love with you, you must remove from their Hives mouthes, unlucky, mischievous, and deceitfull people, and ide persons that have nothing to do, causing them to stand further off: As also all those that aredi-Rayned with whoredome, or infected with the disease called Gonorrhea, or the fluxe of mentiones, bathes, or any thing that smelleth of smoak, mud, dung, or ordure of Cattell, men or beast, houses of Office, sinks, or kitchens. Mundifie and correct the air oftentimes, insected with the breath and vapour of Toads and Serpents. by burning of Balm, Thyme, or Fennel; having great care to keep them neat, clean and quiet. Destroy all Vermine, and seekers to prey upon their Honey, robbers, pillers and pollers, and if at any time they be fick, give them phyfick.

Now the figns of their unhealthinesse, as of all other living creatures, are known by three things; that is, from the action offended, the outward affect of the body, and excrements. For their cheerfulnesse being gone, suggish dulnesse, agiddy and vertiginous pace, often and idle sand-ing before the mouth of the Hive, lack of strength, wearinesse, lithernesse, languishing, and wast of spirit to do any businesse, detestation of Flowers and Honey, long watchings, and continual fleepings, unaccustomed noyses and hummings, are sure arguments, that Bees are not in god health. As also if they be somewhat rough, not fine and trim, dry and unpleasant in handing, not fost, harsh, and rugged, not delicate and tender, if their Combes be insected with any major

of filthy, carrupt, and noylome favour, and that their excrements melt, think, and be full of worms. carrying dead carkafes daily out of their houses, that they have no regard to their Bees and Beehives, it is a certain token that they are fick, and that fome epidemicall, generall Pestilence or plague rageth amongst them, whereof that famous Poet Virgit hath very elegantly, but consuledly touched fome part, in the fourth Book of his Georgicks, in these following Verses.

Si però (quoni am lapfus Apibus quoque nostris Vitatulit) trifti languebunt cotpore morbo. Had non dubits poterio, cognofeste fignis, Cantinuo est azrie aline colore berrida vultum Deformat maries, tum corpora fusa carentum Expertant tellin. & triftie fuvere ducunt, Aut il'a pedibus connexa ad, limina pendent,

In English thus; The life of Bees is Subject unto fall. Their bodies languish with diseases sad: This by undoubted figns difcern you (ball. Their bodies then with other polaur is clad. A leannesse rough doth then deform their faces Then doth the living bring dead bodies out And for their fellowes make a funerall place Mourning sad exequies their dwellings all about,

Aut intus clausis cunclantur in edibus omnes. Ignaveque fame, & contracto frigore pigra. Tum fonu auditur gravior, traffimque fusurrant. Frigidus ut quando filvia immurmurat aufter. Ut mare, folicitum ftridet refluentibus undis, Æfinat ant/claufis, rapidus fornacibus ignie.

Or elfs with feet in feet they hang upon The threshold of their Hives or elfe abide Close within doors, not looking on the Sun, Till flotb by cold and famine their life up dry'd's Then also is their found and voice more great, Drawing folt, like a Southern winde in woods, Or fire enclosed in burning furnace heat, Or as int' Sea falls back the fliding flouds.

And so the sicknesses of Bees being evidently known, plainly perceived, and cured, they will live many yeers, although Aciffotle, Theophrasims, Pliny, Virgil, Varro, Columella, Cardan, and finally all Authors, would make us believe, that they feldome attain to nine years, but never to ten. Although we know by good experience, knowledge of place, and the credible attellation of men worthy belief, that they have lived thirty years. Which only reason bath induced me to believe, that Bees (even by Natures appointment) are long lived, and that only with Alberton Lonly doubt, whether

they die by means of old age.

I am not ignorant, how they are made away with the rage and violence of diseases, and other enemies but it they have all things fürnished fit for the preservation of their life, and prolongation of health, and the contrary far from them, I know no reason but that I should conclude them long there and gathered from a divine dew (the very life and foul of all herbs, fruits, trees and plants.) Of whose nature, nie and excellency, if you would know more, I must referre you to the carned writings of Phylitians.

dwittings of Physicians.

A Drone or a Dran in English is of the Latines, called Figure, of the Greeks Rephen, and Thronage, The Names, A of the Ibrians Czena, of the Germans Traep, of the Hollow, of the Spaniards Language, of the Islama, Apa change made, of the French Baradon, and Fulon, of the Pannanians (now called Hungarians) Here, of the Polonians Czerze. This kinde of Bee is called Frem, as some think, guide fur, because he doth fursing mella devorare, devour Honsy by frealth: although it be more agrees able to truth that it is termed knows because he doth Apipus surm fraudenque, facese: And through the colour and pretence of keeping warm the Hives, he spendeth their Rock and undoes all their Honey-making. And therefore for some to derive Fucus the Latin word from Phagomai the Greek, seemeth to be favre feeched. Some again will draw Fucus. Founda quia invulando chum invant some se

Honey-making. And therefore for some to derive Fuew the Latin word from Phagomai the Greek, fespieth to be faire fetched. Some again will draw Fueus, a sovende, quia incubando agum javant seim as, and this in my minde is as harsh as the former.

Many men make the Drong to, he one of the four forts of Bees, which is very unadvisedly dans. The Description of the make us believed: Because they believe to great as the common Bee, and greater they believe to great as the common Bee, and greater then the Thief, so that in his perfectly wrought. He is twice so great as the common Bee, and greater than the Thief, so that in his perfectly wrought, was suppositely the King himlest: and yet he attained this greater in him to this greater, not by the gift of Nature, but by, his culton and trade of, life. For whereaster the Drongs, and make their Cells, for the directing of Drones: they make them lesser them the Drones, and so there through the laws, but only in the uttermost, and as it were in the banded or most out-cast place of all in the whole Camp and doded Army. Besides, the suppose, and lingue of them all in the whole Camp and doded Army. Besides, the suppose, and lingue of them all, in the bands of the bands out of them; all, in the bands out of the middless. Who, yet at length grow greater then any of them; all, in the groat hundress, wherewell is the Oxen-lying in the purposes, wherewell is not begreater then any of them; all, in the groat hundress, wherewell is not begreater then any of them; all, in the groat hundress, wherewell is not have and diminist nothing of superfluous matter; and in the purposes, wherewell hundress where life of the order that business, wherewell is not have and diminist nothing of superfluous matter; and in the common of the purposes, wherewell is not have all of the order than the order of the order that business. the groffe hungurs, where with they abound; as also there both day and night (like Oxen lying i Rick and Manger) they gluttonoully ravengend shifts themselves with the Honey-liquor, which they gluttonoully ravengend shifts themselves with the Honey-liquor, which they grow again to the shift of victual and the shifts and the shift of victual and the shifts are shifted as the shifts are shifts and the shifts are shifts are shifts and the shifts are shifts and the shifts are shifts are shifts and the shifts are shifts are shifts and the shifts are shifts and the shifts are shifts are shifts and the shifts are shifts and the shifts are shifts are shifts are shifts and the shifts are shifts and the shifts are shifts and the shifts are shifts are shifts and the shifts are shifts are shifts and the shifts are shifts and the shifts are shifts and the shifts are shifts are shifts and the shifts are shifts are shifts and the shifts are shifts and the shifts are shifts are shifts are shifts are shifts are shifts are shift Michthay, Again pay, for full dearty, in time of sany general dearth and karfity of victual and Blothon Sugar Styres and Worth Styres To 195% |

west and her didor

The History of Serpents.

Further this is to be added, that the Drone is of a more flining black colour then the true labour-Further this is to De aqueu, time the greatest, without fting fluggish, idle, flothfull, without heart or ing Dec; he is also greater then the greatest, without fting fluggish, idle, flothfull, without heart or ing nee; ne is ano greater then the Breater, not daring to venture life and limb in manly Martial trade,

the true legitimate Dees will.

Ariffolle faith, that they breed and live amongst the true Bees, and when they fly abroad, they as the true legitimate Bees will. Arifolie laith, that they breed and there aloft in the air as it were, with some violence or tempel; are carryed scatteringly, here and there aloft in the air as it were, with some violence or tempel; are carryed icatteringly, here and there are they return from whence they came; there greedly feeding so exercising themselves for a time, they return from whence they came; there greedly feeding fo exerciting themselves for a time, they recent thom whether the Dukes and Princes, in respect upon the Honey. Now why the Drones may be compared with the Dukes and Princes, in respect upon the Money. Now why the Drones in their fting, let us hear Ariffotler reason. Nature of their corporature, and Bees like unto them in their fting, let us hear Ariffotler reason. Nature of their corporature, and besome difference, lest alwayes the same stock should encrease one of would (saith he) there should be some difference, lest alwayes the same stock should encrease one of would faith ne) there mould be loud another confideration, which is impossible: Por fo the whole flock another confudedly, without order or confideration, which is impossible: Por fo the whole flock another confucuty, without of the And therefore the true Bees in strength and power of engenwould either be Dunce of Engen-dring, and breeding, are comparable to their Dukes, and the Drones onely in greatnesse of body dring, and preceding, are compared to body refemble them: to whom if you allow a fling, you shall make him a Duke. These Drones further relemble them : to whom it you and the putteth not forth any fling : whereof History hath of the Grecians are called Cothouroi, because he putteth not forth any fling : whereof History hath these Verses thus interpreted; The war had

Which Drone like in the live, Nor good, nor ill, endeavour can Upon bimfelf to live.

Both Ged and min disdain that man But idle is, and without sting, And grieves the labouring Bes Devouring that which be bome brings; Not yeelding bely or fee .

So that either he hath no sting at all, or else maketh no use of it for revengement physich Hatly, that they are stringlesse, and would have them called imperfect Bees and the famous Poet Hatty, that they are mingrene, and would have them cancer imperiest bees, and the ramous Poet Virgil (tyleth them, Ignavum pecus: that is, idle, and unprofitable, good for nothing. Combillant ketli them a race or flock of a larger fize; very like dinto Bees, and accounted them very apply to be placed in the rank of ordinary forts of Creatures, of the fame kinds and company with Bees. De placeu in the rank of ordinary forts of Creatures, of the fame kinde and company with Bee. They fuffer punishment and are scourged many times in the whole Bee common wealth incomit for pretence of idlenesse, gluttony, extortion, and ravehous greedinesse, to which they are not addicted; but because lacking their sting; and by that defect, being as it were emastimated into these themselves in publick.

Pliny doth not expresse their nature and quality. The Drones are stinglesse and so to be tector ed imperfect Bees, and of the baselt fort, taking their Originall from tired and work but Bee, and fuch as be past labour and service, living only upon a bare pension: we may call them the very flaves and bond-men of the true Bees, to whom they owe all due homage and subjection, where fore they exercise their authority over them, thrusting them first out of doors by head and should be their authority over them. ders, like a company of drudges to their work; and if they be any thing negligent, not belling elementely guickly and lively, they give them correction, and punish them without all pirvand at the state of the correction of the state of the ty. For in the moneth of Jane, two or three Bees (especially of the younger fort) will hale out of ty. For in the monetnor yane, two or three Bees (especially of the younger fort) will have one Drone, there beating of him with their wings, pricking and commenting him with their Hings, and of the offer any refillance to their Tordly rule, then they violently talk him down their Hings, and of the world break his from the their of her where they have glutted their wills, and punished him at the full they at length rick. Thus when they have glutted their wills, and punished him at the full they at length rick. Thus when they have glutted their wills, and punished, not without great admiration and purshim to a flamefull death, all which we have often beheld, not without great admiration and preaches.

Bometimes the Drones remain like bamified persons, before the entrance of the Hille and the not venture to pressent answer barring perions, perore the entrance of the most the Diograms of the pressent and the property of the pressent and the property of the property bowers or that they be pinched with hunger and famine, for lack of Honey. And semerary a statistic field with the Drones, for to thake it more apparent they will not furt flat perous a statistic for take away with their their thands any of the Drones, and to dalt their than their t

tins kinge, energiare the most noble and couragious!

The young Troness are the most noble and couragious!

The young Troness are the most and to the kingly flock. Some will be the young the promote the kingly flock. Some will be the young the kind of leech their Original and perigree from the Kingly flock. Some will be the young the kind of leech their Original promote the howers of the herb Carmbe (described by plin; which is kind of Honey with their Original promote and Read, but the horby table is having the rate of the Honey and Warrosecher) from the Original has the rate of the Honey and Warrosecher) from the original has the rate of the Honey and Warrosecher) from the original has the rate of the horby and warrosecher) from the original has the rate of the horby and read the post of the horby and warrosecher from the course of the horby and the horby and the horby and the horby and the course of the horby and the Their genera-: ban Arffold affirmethy that they proceed from the longer and bigger Bees, year, and that they proceed from the longer and bigger Bees, year, and that they proceed from the longer and bigger Bees, year, and that they proceed from the from the ancient Philosophers, or the longer which without question he received either from the ancient Philosophers, or the longer land to the land to

lome others that had the charge and were skilful of ordering Honey, that lived in his time. Some will have them to breed and come from putrefaction, as Ifidore from stinking and putrefied Mules: Cardan from Asses, Plutarch and Servins from Horses. Othersome are of opinion, that they first proceed of Bees, and that afterwards they degenerate baftardlike from them, after they have toft their flings, for then they become Drones : neither are they afterwards known to gather any Honey, but being as it were deprived of their ftrength, they grow effeminate, ceafing either to hurt. or to do any good at all.

Some again hold the contrary fide, affuring us upon their knowledge, that the true labouring Bee fetcheth his beginning from the Drone, because long experience (the Mistress of Wisdome) hath raught us, that there is yearly known to be the greater fwarm, when there is che greater multinde of Drones. But this to me feemeth rather the devise and invention of some curious brain, then any true grounded reason. For because that many Drones breed (as it cometh always to passe in good and plentiful years) therefore there should be greater swarms, is no good consequent : but contratiwife, because the multitude of Bees do greatly increase through the moderatenesse of the oureair, and the plenty of the Honey-dropping dew, and through the abundance of this mellifib. ous moutture, there must needs follow a greater foison and store of Drones as the Philosopher hath well observed. But admit that this betrue, that whereas there is the greater encrease of Drones. there should yearly ensuethe more swarmings; yet must we not thereupon conclude, that Bees 40 owe, and ought to ascribe their first original from Drones, but rather that they are indebted and bound in honefty to the Drones, because in time of breeding, they give much warmth and comfort to their young, (as Pliny lib. 11. c. 11. faith) conferring upon them a lively heat, fit for their encrease and prospering. Some divide them into male and semale, and that by coupling together they make a propagation of their kinde, although (as Athenaus writeth) neither Drones nor Bees were ever yet feen of any one to couple together.

But whereas Wasps, Hornets, and other Cut-wasted creatures that make any combes, and breed in the same, have been sometimes (though seldom) seen, both by us and Aristotle, to joyn together, I can furely fee no cause why we should utterly take from them the use of Venus, though in that re-

feet they be very modest and moderate.

I have before in the discourse of their generation, said, that the Bees do make the male kinde, and the Drones to be but the semale; but sith that in the of Honey-making, they punish them so sharply after they have ejected them from possession first, so that afterwards they put them to death, I can hardly be induced to believe that the Drones are but the female kinde, confidering that one thing would eclipse and overcast all those resplendent vertues which all men know to be in Bees, to deal thus cruelly with their Parents. To what use therefore serve they in Hives? Seeing Virgil in the fourth book of his Georgicks thus describeth them;

Immunisque sedens aliena ad pabula sucue.

That is to fay: The Drones as free and bold doth fit, And wast of others food commit.

Where Festus taketh Immunis, for lazy, idle, unserviceable, unprofitable, and such as are nothing worth, except perchance after the guife of wicked men, they fo ferve their own turns, as to live by the liveat of other mens labours, and to bring out of order, or utterly feek to overthrow the whole frame of the Common-wealth.

But the most approved Authors set down divers good use of Drones. For if there be but a few Their uses. of them among the Bees, they make them the more careful about their affairs, and to look more duly to their task: not by their good example, (for they live in continual idlenesse) but because they might continue their liberality towards strangers, they work the more carefully in their Honeyhop. And (if Bartholemans do not deceive us) these Drones be not altogether idle : but they imploy themselves about the building of the Kings House, which they make large, stately, and very imptuous in the higher and middle part of the combes, being very fair to fee to in respect of their

So then they are but lazy, in respect of Honey-making and gathering: but if you look toward their Art or Science of building, they are to be accounted excellent devilers of the frame and chief Millers of the whole work. For as the Bees do fashion out the combes of the Drones nigh the Kings Palace: fo again, for the like counterchange of kindenesse, the Drones are the fole inventors, and principal work-mafters of the Kings Court; for which cause both they and their off-spring, kinslolks and friends, (if they have any) are bountifully rewarded of the whole stock of Bees, by giving them franckly and freely their diet and maintenance which coffetherhem nothing.

The Lockers or holes of the up-grown Bees, are somewhat too large, if you respect the quantity of their bodies, but their combes leffer; for those they build themselves, and these other are made by the Bees, because it was not thought convenient and indifferent, so great a portion of meat to be gven to fuch vile labourers and hirelings, as was due to their own fons and daughters and those that

Testzer, and some other Greeks do besides affirm, that the Drones are the Bees Butlers or Porters hearty them water, ascribing moreover to them a gentle and kindely heat, with which they are said Okeep warm, cherish and nourish the young breed of the Bees; by this means as it were, quickangthem, and adding to them both life and strength.

OF WASPS.

The fame affirmeth Columela in these words. The Drores further much the Bees for the procrea-The same amrineta Columnua in their works.

tion of their issue, for they sitting upon their kinde-or generation, the Bees are shaped and attain to their sigure, and therefore for the maintenance, education, and defence of a new issue, they reto their rigure, and their electron the the And Play lib. 1-1.0 11. different not from him. For not coive the more friendly entertainment. And Play lib. 1-1.0 11. different not from him. ceive the more irrenally enter talline and architectionical or cunning deviced frame (as he faith) only they are great helpers to the bees in any discovering, their young, by giving them much warmth and but also they do good in helping and successful their young, by giving them much warmth and but also they do good in neiping and the country the forme lack of Honey in the mean space) the kindely heat, which the greater it is (unlesse there be some lack of Honey in the mean space) the

giesten will the Iwarm be.

In fum, except they should stand the Bees in some good stead, the Almighty would never have and fum, except they should stand as it were made them freetien of the same City. Neither successful them both in one house, and as it were made them freetien of the same City. Neither enciolem them potti in one noute, and are violently break in upon them, as being the fworn and adoubtlesse would the Bees by main force violently break in upon them, as being the fworn and proleffed enemies of their Common-wealth, except when their flavish multitude being too much increased, they might fear some violence or rebellion, or for lack of provision: at which time increaled, they might lear fonte violence of the work-men, free Malons, and Carpenters might who feeth not, that it were far better the Maller work-men, free Malons, and Carpenters might who leath not, that it were labouring Husbandman, and tiller of the earth? Especially since that me apareu, then the true land and the for lack of meat, and other necessaries, and shole other for missing these, our life is endangered for lack of meat, and other necessaries, and shole other for mitting there, our mers change thout our undoing, and for a need every one may build his own lodging. But as they be profitable members, not exceeding a Ainted and certain number, for longing. put as they be roomany, they bring a ficknesse called the Hive evill, as well because they consume the food of the Honey-making Bees, as for that in regard of their extream hear, they choke and fuffer

This disease is by the Author of Geoponicon thus remedied. Moisten with water inwardly the id or covering of their Hive, and early in the morning opening it, you shall finde Drones fitting on the drops that are on the covers, for being glutted with Honey, they are exceeding thirfly, and by that means they will flick fast to the moist and dewie places of the cover : So that with small ado, you may either destroy them quite, or elfe if you please, take away what number you lift your felf. And if you will take away withattcheir young, who are not yet winged, and first pulling of their heads throw them among the other Bees, you shall bestow on them a very welcome dinner. But what the dreaning of Drones portonded, and what matter they minister in the Hieroglyphical Art, let Apomasura reveal and disciple out of the Schools of the Egyptians and Persians. I chink I have discharged my duty, if I have fer down their true uses, true nature; generation, degeneration,

description, and names.

Fur in Latine, or Theef in English, is by Aristotle called Phoor, of Hespebius Phoories : from whence I take the Latine word Fur to be derived. Some have thought that Theeves are one proper fort of Bees, although they be very great, and black, having a larger belly or bulk then the true Bee, and yet leffer then the drones, they have purchased this theevish name, because they do by thest and robbery devour Honey, belonging to others, and not to them. The Bees do easily endure, and can well away with the presence of the Drones, and doas it were greet and bid one another welcome, but the Theeves they cannot endure, in regard that the Bees do naturally hate them, for in theirab fence the Theeves privily and by stealth creep in, there robbing and consuming their treasure of Honey, fo greedily and halfily (without chewing) swallowing it down, that being met withall by the true Bees in their return homewards, and found so unweildy by means of their fulness, that they can not get away, nor be able to refift, but are ready to burft again, they are feverely punished, and for their demerits by true Justice put to death. Neither thus only do they prodigally consume and send the Bees meat, but also privily breed in their cells, whereby it often cometh to passe, that there are as many Drones and Theeves, as true and lawful Bees.

These neither gather Honey, nor build houses, nor help to bear out any mutual labour with bes: for which cause they have Watch-men or Warders appointed to observe and oversee, by night sate as are over-wearied by taking great and undefatigable pains in the day time, to fecurethem from the Theeves and Robbers, who if they perceive any Theef to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know here and submitted to be folin in a doors, they prefently know the folin in a doors th on him, beat, and either kill him outright, or leaving him for half dead, they throw him out. Often times also it happenethy that the Theef being glutted and over-cloyed with Honey, cannot flie away or get himself gone in time, but lyeth wallowing before the Hives entrance, until his enemies either in coming forth or returning home do fo finde him, and fo with shame, discredit and froffing.

Their ules.

Ariffolde appointeth no office, charge or businesse to the Theef, but I think that he is ordained for fcornflay him. this end, that he might be as it were a four to prick forwards, and to wher and quicken the courage of the true Bees, when the other offer them any injury : and to fir and to encourage them to a great vigilancy, diligence, and doing of right and jultice to every one particularly. For I cannot feel what other purpose Theeves should serve in a Christian Commonwealth, or what use might ke made of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches, ambushes, and deciminate the state of fuch as lie in wait to displeasure, and practice by crafty fetches. treacheries to wound their Neighbours, either in their estimation, credit, or goods. Thus having a large discounsed of the laste having a large discounsed of the laste having a more large discoursed of the lesse hurtful and stinging fort of Bees, I will now apply my self to a more funds, sally angre William and the sally a fumish, telly, angry, Waspish, and implacable generation, more venomous then the former, I man Wasps and Hornets.

Walp of the Chaldeans is tearmed Deibrane. Of the Arabians, Zambor. Of the Englishmen & D. Bonham. A Walp. Of the Germans, Ein Welpe. Of the Belgics, Harfel. Of the Gothes, Bool Geingth. The common people of Italy tearm it Vesta, and some of them do usually call it Muscone, and the Bonecommon people. The French, Guesse. The Spaniards, Abispa, and Vespa, imitating the Latines, who callit Vespa. The Polonians, Ossa. The Sclavonians, Woss. The Hungarians, Daras. Calepine saith, that it is called Vefpa, quia vefperi muscas venatur in cibum. The Greeks do also name them diversly , for commonly they are called Sphekes. The Scholiast of Nicander calleth them Lucospades; and Suldes Dellides, and Dellihes. Of Heffchim, Auletai, and Paffaleres; and Gaza nicknameth them Anthrenai; for these ought rather to be called Bees. Euffathim deriveth Tow spekas, apo tes diasphagon, because they feem to be fo much cut afunder in the waste or middle, as that they feem to gape and to be clean doven afunder, as by the figure here fet before your eyes you may plainly perceive. A Wasp is a kinde of insect, that is swift, living in routs and companies together, having somewhat a long body encircled, with four membranous wings, (whereof the two former are the greatest) without bloud, finged inwardly, having also fix feet, and a yellow colour, somewhat gliftering like gold, garnished with divers black spots all over the body in form of a triangle. Whereupon peradventure Pollio would needs have it called Diachrufee.

The body of a Wasp seemeth to be fastened and tyed together to the midst of the breast, with a certain thin fine thread or line, fo that by means of this disjoyned, and not well compacted composition, they seem very feeble in their loins, or rather to have none at all. Whereupon Aristophanes the Greek Poet, in his Comedy, entituled Spheces or Wasps, tearmoth all those Maids which are fine, slender, and pretty small in the waste, Sphecodeis, resembling them to Wasps, as if one should call them Wasp-wasted-wenches, whom Terence very quaintly and elegantly tearmeth Juncess, that is, flender, long, and small, like to a Bulrush. I think that all the whole pack of them have stings in general, although I am not ignorant that some Authors hold the contrary, affirming that the breeding female Walps do want them: but thus much I can fay of my own knowledge, that on a time finding a Walps neft, and killing them every one by pouring hot scalding liquor into their holes, because I would bolt out the truth, I plainly perceived by long viewing of their bodies, that there was not one of them all but had a fting, either thrust out evidently, or closely and secretly kept and

-Quid nobis certius ipsis Sensibus effe potest, quo vera ac falfa notemus? In English thus: What can more certain be then fenfe, Discerning truth from false pretence?

They make a found as Bees do, but more fearful, hideous, terrible, and whisteling, especially when Lucresius. they are provoked to wrath; from whence Theory it letcheth this proverb, Sphen bomboom teniget mantion, that is, Scilicer obstrepitant argut a velpa cicada: and this old faid Saw may well be applyed to in Hoediporis. thosewho being themselves unlearned, will not slick to cry out, exclaim, and procure trouble to those that be more learned: or to fuch as be weak, feeble, and impotent persons able to do nothing, that will offer to contend with their betters and Superiors with their brawling speeches, and spiteful raylings. And this Latine proverb carryeth the same sense, Catulus leonem adiatrans.

If you will have the gifts and ornaments of their mindes described, you must consider that a Wasp ha creature that liveth in companies together, one with another, subject to a civil government under one King or Ruler, industrious, mutual friends one to another, ingenious, crafty, subtle, quick, and cunning, of a very quarrelfome nature, and much subject to anger and testinesse. This is a good Argument of their Civil and Political manner of life, in that they live not folitarily in a Defert or Wildernesse where no man keepeth, but they build for themselves a City, both excellent and adminble for the notable buildings and houses in it, where they spend their time (for the most part) actording to the mutable and never-failing laws of Nature, observing and keeping ever the Golden men, as well in their daily tasks, as in their dispositions and affections of minde.

Belides, they are governed with a Kingly, not with a tyrannical government, (as Elianus faith) although by nature they are great fighters, eager, boysterous, and vehemently tempessure ous: and he is led to fay this, because their Dukes or Generals are stinglesse, or rather having stings as ther subjects, they will not use the same to the hurt of their inferiors, by thrusting it forth, or

Now although they be twice so great, and harder and rougher then the other Wasps, yet are they not unfurnished of the vertue of patience and elemency, or gentle and debonair behaviour, by which means they keep in order, and contain in their lifts, as it were by gentle language, their unruly rout, and mutinous companies. There is no man but will confesse, that this is an trident token and argument of their mutual love, and great good liking which they bear one to hother: for whofoever dare be fo knack-hardy as to come neer their houses or dwelling places

Of Bees called

where they have to do, and to offer any violence or hurt to the same, at the noyse of some one where they have to do, and to one any violence put into an amazed fear, to help their fellow. of them, all the whole swarm rusheth out, being put into an amazed fear, to help their fellow. of them, all the whole swarm rumeth out, being run end their molesters, as that they fend Citizen, and do so bussly bestirre rhemselves about the ears of their molesters, as that they fend Citizen, and do to burnly bettire themselves and if we will credit Ælianus, the Phofe them away packing with more then an ordinary pace: and if we will credit Ælianus, the Phofe them away packing with more than a conclusion of the conclusion of the conclusion of the phofe. them away packing with inorether an ordinary for all their defence, munition, and Anther in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition, and Anthers in times past were constrained to forsake their City, for all their defence, munition and Anthers in the constrained to forsake their City, for all their defence, munition and Anthers in the constrained to forsake their city, and the city of the c tites in times part were contrained to loriant cruel fiercenesse of the Wasps, wherewith they were mour, only through the multitude and cruel fiercenesse of the Wasps, wherewith they were

Which thing advised in his along, 10. 12. infilmateth by the example of the chafing god Jupiter, who took it marvellous angry, and much repired at the the example of the Grecians, adding, that the Greeks did defend themselves as valiantly, and enflurdy fromacks of the Grecians, adding, that the Greeks did defend themselves as valiantly, and enflur from the Greeks of the Greeks and the Greeks are also as the Greeks as a standard and the greeks are also as a standard and the greeks turay nomacks of the Greenant, adding, that as ever Wasps or Bees would in defence of their children the shock and assault of their enemies, as ever Wasps or Bees would in defence of their children the shock and assault of their enemies. dren or iffue; in these Verses following:

- Non enim ego putavi heroas Achivos Suftentaturos noffrum robur, & manu invicam: Illi autem quafi vefpe acres atque apes,

I did not think our noble Grecian Lords could bear Our force, and with unconquered bands maintain Our right: but they like Wasps and Bees devoid of fear Which by bigh-wayes their houles ufe to frame,

Que nidos faciunt ad viam pulverulinam. Neque deserunt cavam domum : fell expettantes Viros venatores pugnant pro fillir.

That is to fav. De not forfake their bollow dufty bomer. What ere they be that come to bunt them out: Fighting with valor, (not fearfully like Drine) To rid their young ones both from death and doubt.

Besides this, they further build for them very large dwellings, with Chambers and floors, in a round and orbicular form, with rooms one above another, finely and wittily compacted, fo that there is space enough of ingresse and regresse, and very desensible against all windes and weather, and yet their nests or houses are not all made after one fashion, but very different, someofthem representing a Harp, some made much after the fashion of a Pear, a Toadstool, a Bottle, or budget of

Leather, and some like a standing Cup with handles. Some affirm, that the matter of their Combes is confused, rude, and ilfavouredly heaped up, full of bark and fand, but I could never as yet see it otherwise then light, slender, and thin like paper, dry, tramparent, gummy and thin, as though it were thin leaves of gold, shaken very enly hither and thither with the winde, and rifing many times from the foot or foundation very [mall, and broad above like unto a Top. The place of this their building is divers, and much different for some respects. For if they have lost their Duke or principall Leader, then do they makethen nefts of clay in the high holes of walls and hollow Trees; and as some say (although hithmol could never fee it) they make Wax there also.

But in case they have a Generall or Duke, then they make their nests under the earth, there Cells or Chambers being formed with fix angles or corners, much like unto Bees. They make their Combes round, much after the fashion of a broad Toad-stool, from whose centers there goeth forth as it were a short stalk or tying, by which the Comb cleaveth, and is fastened hard to the earth, or some tree, or peradventure to some other Combe. They have such a tender care our their females, (especially at such time as they are great with young) and suffer them so much to have their own wills, as they will neither permit them to take any pains abroad for their living. nor yet to feek for their meat at home : But the males flying about, (like good Purveyers) bring all home to their own dwellings, thereby as it were strictly enjoying the females to keep them-

All which fore-cited particulars, if a man would duly enter into confideration of them, he must needs confesse, (will he nill he) the admirable industry, diligence, wit, prudence, Art, sweat, and labour that is in these poor vermine. Their naturall inclination to anger, and the hally simisfund of Wasps, not only Cocks, which do scratch and scrape up with their spurs their nests, do finde in placable, but even all other disturbers and provokers: From whence I take it that proverband Spring, Speklan erithizein, which the Latines as Plautit, almost in the fame fense useth, Imitat Ch brones: For Crabre among the Poets, is used sometimes for a Hornet, and otherwhiks for a

In like manner Clemens Alexandrinus, Stromaton 2. When he would expresse and declare the sould and abominable hurt of fuch fins that do lie in wait as it were to deceive, and watch to be displeasure to the life of man, bath these words, Houtei gar (inquit) of antagorifial parkit ha Olumpicol, sphecon bos espein esft deimuterat, kai malifta bedone. That is, thefe fat, dull, groffe, and Olympicall enemies of ours, are worfer then Wasps, more cruel and displeasant, and especially fenfuall and worldly pleasure. Yea, who soever dare adventure to challenge into the field this hardy and couragious little Creature, he shall (I dare be bold to say) but Cadmeam victoriam reportare, lose more then he shall get, whet his sword against himself, and return home by weeping crosse, conmore that besides the noblenesse of their stout stomacks, and armed stings, they are withall so diffe and obstinate, as that they will never give over.

Of the Wasp.

They differ also in their first breeding, stock, sex, place, seeding, and manner of labour. Isolare faith. (although perhaps not fo truly) that Wasps do first proceed from the rotten Carkases of dead Affes: for all hold opinion, that the black Flies called Beetles, do take their Originall from them. But I am rather moved to think that they were first bred from the dead body of some warlike and fierce Horse, and so also thinketh Pliny, in his eleventh book and twentieth Chapter. And the Great

cient have usually this famous and vulgar Verse in their ordinary talk:

Hippoi men sybekon genesis, Tauroi de melisson, Equi enim velparum generatio, Tauri verò Apum.

In English thus:

Wasps do first come from Horses, and Bees are bred from Bulls.

And furely their incredible swiftnesse in their slight, their ardent and burning defire they have to fighting, are sufficient inducements to move me to think, that they took their first beginning from some gallant Horse, and not from Asses, Oxen, or Cowes, and much lesse from the searfull Deer. For dame Nature hath seldome been so indulgent and friendly to any one beast besides an Horse, as to excell both in swiftnesse of pace, quicknesse of spirit, courage of stomack, and magnanimity. And I rather lean to this fide, because else I do not know what sense I should give to that Ariftotelean Proverb;

Chairete aellopodoon thugateres ippon, Salvete volucripedum filia Equorum : Which may be Englished thus: All bail ye daughters of swift footed Horses.

For besides the truth that lyeth in the bare words, I take the morall of it to be uttered as a wife tycheck, or a figurative flout, conceitedly to rebuke and hit in the teeth those shrewd women. curft and foolding wives, which are so peevish that they will not be pacified, who are like unto Waspsintheir sullen displeasant humours, tempestuous madnesse and pelting chase.

Some Wasps do proceed from the stinking Carkase of a Crocodile, if we may give any credit to the Egyptian and their fellowes; and for that cause, when they imagine or think a Wasp, they paint and draw out the shape and form of a Crocodile or a Horse. From hence Hierom Cardan would make this collection, that of every corrupted living Creature another doth proceed : which in my conceit is very abfurd and against all reason. For this being granted, the generation of Wasps would be infinite, and daily experience would read a Lecture of contradiction against him, upon the progresse of Natures works. Many times Wasps do breed by the mutuall company of the male and female together, which though Athenaus counteth but a fable, yet for all that, fith the Philosopher doth plainly tell us, that he hath been an eye-witnesse to the same, (as in his first book De generat. Animal. cap. 16. and in his ninth book De biffer. Animal. cap. 41.) I will wholly incline to his judgement. But what manner of beginning they have by joyning together, and howit is perfected and accomplished, let us a little lend our listening ears to Aristotle, and Pling his Interpreter.

The Princes or Ring-leaders of the Wasps, when they have made choice of a fit place for themselves under the earth, either in the holes, chinks, or clefts of the Rocks, or in thatched houses, (as I have often feen) there they make their Combes in the beginning of Summer, fashioning their mall Cells with four little doors, wherein small Worms do breed, who when they are more grown, they make yet other greater doors or hatches, and then again when their young are at the greatest, they make others, so that towards the end of Autumn, you shall finde many, and those try large nells; wherein their principal Commander doth breed, not with every Wasp indifferently, bit only with those of his own race and princely linage. They are bred in the most eminent and higheft place of the Wasp-nest, like unto great Worms, their Cells being four or five in number, cole joyned and couched together, for otherwise they would increase after the same fort in all respects, as the common Wasps do.

The excrement is only in the small Worms, and their young increase remaineth immoveable without any dirring before they be able to flie, and whilest they are covered as it were with a thin membrane, and yet in the same season of the yeer, and in the space of one day, you shall manifely fefly perceive a great difference: for one flyeth out, another sticketh still as it were in the shell, another rolleth and tumbleth, and a fourth cannot stir one whit. All these have their beginning and increase for the most part in Autumn, not in the Spring, and especially in the full of the Moon. This one thing here is to be noted, that Wasps do not swarm, and that in Summerimethey are subject to Kings, and in Winter, Gunaicocratela, the semales regiment, or Multebre

imperium prevaileth. And when they have renewed and repaired their iffue with a great supply, and that they be fresh and lusty, the Empire again returneth to the Masculine kinde, and yet it is but a that they be tiefly and ruinous Empire, notable to bear up it felf, although by Natures immutable de. cree orderly ruled, and rightfully governed.

ee orderly ruled, and rightfully governed.

Ariffule faith, that it is not likely that the young Wasps are brought forth as a brood, because they Ariffolie faith, that it is not likely that the young feem probable, that fo fmall a flie as a Wafp, should be fo great in bulk, as that in reason it should not feem probable, that for fmall a flie as a Wafp, should be former to the feet and the feet a be to great in outs, as that in table is a bare and weak reason, not befeeming the dignity of fo nave tuen great young ones. Due than any man alleadge to the contrary, why Nature in a lawful birth great a Philosopher. For what can any speedily finish, and make to grow and increase, as she doth and breeding should not as soon and as speedily finish, and make to grow and increase, as she doth and preequing, mound not as foot and of the preequing in generation that proceeds of rottennesse or corruption, which I hold to be but illegitimate? Let me in generation that proceeds of total the first they be out of the shell, they be feathered, they but call to minde young birds, in how short time after they be out of the shell, they be feathered, they but call to minde young bit us, in now make the first to minde young bit us, in the beable to go, to eat, yea quickly increased in strength, and grown to their full greatnesses, so that be able to go, to eat, yea quickly increased at the which when one hath throughly confidered, he they are in their full flowre ere one be a ware. All which when one hath throughly confidered, he they are in their run nowre ere one be a war arifole, to have relyed but upon a weak prop, having will eatily judge that famous Philosopher Arifole, to have relyed but upon a weak prop, having fearie probability to stand on his side for the maintenance of his opinion. His credit therefore at this time must not be sufficient to barre us the liberty of contradicting him.

The same Aristotle, the Monarch of our modern learning, saith that the small worms of Wasp, the same arribute, the Malatta of Walps, before they have any wings at all, are somewhat long, not much unlike those worms which Hippo before they have any wings at an, are ionic winds tong, not line with this wince Hipporter calleth Eulai, that breed in flesh, called (as I judge) Maggots, but in our Countrey, Gentiles: and these Waspish worms are somewhat white, known and easily discerned by their flits or dashes, and these waspin worms are somewhat white, and groffe, having a black lift or line running along the hinder part of their body being very thick and groffe, having a black lift or line running along their backs, without feet, not creeping, but rolling and tumbling themselves this way and that way confusedly. When they have disburthened themselves of their breed, they close up their cells with certain thin small skin, which again being broken when they come to any persection or growth, they get themselves out of dores into the clear light, and at two days end will be able to flieround about, The Philosopher maketh two kindes of Wasps, the one wilde and fell, the other more meek and quiet. The wilder fort is feldom feen, for they live and breed in Mountains and Woods, in Oketrees, and not in the earth, and this kinde is greater, blacker, more diversly coloured, and singerh more cruelly then the other. After they have lived one whole year, they are seen to flie away, if in the Winter the tree be cut down. These kinde of Wasps I did once see in a Wood in Esse, where going unwarily to gather simples with another Physician, and offending one of this sumish generation, the whole swarm of them presently rushed forth about mine ears, and surely had I not had in my hand some sprigs or branches of broom for my defence, I had undoubtedly paid dearly for this my unadvisednesse, if it had not cost me my life, for they pursued me in every place of the Wood, with a vehement rage for a long season, insomuch that I was fain to take me to my heels, and so to seek to save my self from further danger. And if our own Countryman Sir Frank Drake himself had been there, although he was (as Meteranus a stranger, (and so unpartial) in his Bla gick History right truly observed,) Omnium ducum nostri seculi fortissimus ac samosissimu, vet I make no doubt, but he would have taken my part, and been a companion with me in this my fear-

Some of these Wasps, as well those of the crueller kinde as those of the gentler, do lack afting, (or rather I think they use it not.) Othersome again of both forts, are furnished with sting, and those that want them, are ever the lesser and weaker, neither revenging themselves any way, nor offering to make resistance. Contrariwise, those who have stings are greater, stronger, more quirellous contentious, stubborn and eager. Some account these the males, and those other stingette to be the females. Many of those which have stings, do forgoe and quite lose them when Winter draweth on, as some make reckoning, but it was never my hap to see this, saith the Philosopher in his 9. Book De hift. Animal. capit. 41.

If you catch a Wasp, holding her fast by the feet, suffering her to make her usual humming sound you shall have all those that lack stings presently come flying about you, which the stinged Walfe never are feen to do. Therefore fome hold this as a good reafon, to prove that the one should bette male, the other the female. Both these forts, both wilde and unwilde, have been seen to couple to ger after the manner of flies. Besides, (inrespect of fex) both kindes of Wasps are divided into Captains or Ring-leaders, and into labourers : those former are ever greater in quantity, and of more calm disposition; these other, both lesser, more froward, testy, peevish, and divers. The male of labourers, never live one whole year out, but all of them die in the Winter time, which is evident by this, because in the very beginning of cold weather, they are as it were frozen or benummed, and in the depth or midft of hard winter, a man shall hardly or never see any of them.

But yet for all that, their Dukes or principal Chieftains, are feen all the Winter long to lie hid in their lurking holes under the earth: and indeed many men when they plowed or broke up the ground, and digged in Winter, have found of this fort. But as for the labouring Wasp, I never so yet heard of any that could finde them. Their Principal or Captain, is broader, thicker, more por derous and greater then the male Wasp, and so not very swift in flight, for the weightinesse of the bodies is such an hinderance to them, that they cannot flie very far : whereby it comets to pillettat they ever remain at home in their hives, there making and deviling their combes, of a certain gut nous matter or substance, brought unto them by the Work-wasps : thus spending their time in excuting and doing all those duties that are meet, intheir Cellst

Wasps are not long lived, for their Dukes (who live longest,) do not exceed two years. And the labouring, that is the male Wasps, together with Autumn, make an end of their days. Yea which is more strange, whether their Dukes or Captains of the former year, after they have ingendered and brought forth new sprung up Dukes, do die, together with the new Wasps, and whether this do come to paffe after one and the felf fame order, or whether yet they do and may live any longer time diversmen do diverfly doubt. All men hold the wilder kinde to be more flrong of nature, and to continue and hold out the longer. For why, these other making their nests neer unto common highways and beaten paths, do live in more hazard, lie open to divers injuries, and so more subject to

The brevity of their life, is after a fort recompensed, and some part of amends made by the rare clammy glewishnesse of the same : for if you separate their bulks from the head, and the head from the break, they will live a long while after, and thrust out their thing almost as strongly as if they were undivideable, and free from hurt and deaths harm.

Apollonim calleth Wasps Omotoroi, and Aristotle, Meloboroi; although they do not only feed on raw Aeth, but also on Pears, Plums, Grapes, Raisins, and on divers and fundry forts of flowers and fruits: of the juyce of Elms, Sugar, Honey, and in a manner of all things that are seasoned, tempered, made pleasant, or prepared with either of these two last rehearsed.

Plim in his 11. Book capit. 53. is of opinion that some Wasps, especially those of the wilder and feller kinde, do eat the flesh of Serpents, which is the cause that death hath sometimes ensued of their poylonous stinging. They also hunt after great flies, not one whit sparing the harmlesse Bees, who by their good deeds have so well deserved. According to the nature of the soyl and place, they do much differ in their outward form and fashion of their body, and in the manner of their qualities and dispositions of their minde: for the common Wasps being acquainted, and familiarly used to the company of Men and Beafts, are the gentler; but the Hermites and folitary Wasps are more rude. churlish, and tempestuous: yea Nicander tearmeth them Oloous, that is, pernicious. They are also more unhappy, dangerous, and deadly in very hot Countries, as Oviding reporteth, and namely in the West-Indies: where both in their magnitude and figure, there is great difference betwixt theirs and ours, fothat they are accounted far more poyfonous and deadly, then either the English, French, Spanish, or Barbarian Wasps. Some of these dangerous generation do also abound in exceeding cold Countries, as Olaw Magnus in his 22. Book telleth us.

Their use is great and singular: for besides that they serve for food to those kind of Hawks which arecalled Kaistrels or Fleingals, Martinets, Swallows, Owls, to Brocks or Badgers, and to the Camelion: they also do great pleasure and service to men fundry ways, for the kill the Phalangium, which is a kinde of venomous Spider, that hath in all his legs three knots or joynts, whose poyson is perilous and deadly, and yet Wasps do cure their wounds.

Regnard the Fox likewise, who is so full of his wiles and crafty shifting, is reported to lie in wait to betray Walps after this fort. The wily thief thrusteth his bushy tail into the Walps nest there holdingit fo long until he perceive it to be full of them, then drawing it flily forth, he beateth and fmiteth his tail full of Wasps against the next stone or tree, never resting so long as he seeth any of them alive; and thus playing his Fox like parts many times together, at last he setteth upon their combes, devouring all that he can finde.

Plin greatly commendeth the solitary Wasp to be very effectual against a Quartain Ague, if you catch her with your left hand, and tie on fasten her to any part of your body, (always provided, that it must be the first Wasp that you lay hold on that year) Mizaldu memor. Cent. 7. attributeth Mizaldus. great vertue to the distilled water, and likewise to the decoction of common Wasps, affirming exprefly, that if any part be therewith anointed, it straight ways causeth it to swell monstrously, and to be puffed up, that you would imagine them to be fick of a Dropfie: and this coursecrafty drabs and queans use to perswade their sweet hearts, that they are for sooth with childe by them: thus many times beguiling and blinding the eyes of wary and expert Midwives. Whereupon we may very confidently conclude, that their poylon is very hot, flatulous or windy. Some do prole after Waips, and kill them by other fleights and devises. For when the labourers do much use and frequent Elms, which they do very often about the Summer foldice, to gather from them some gummy and damny matter, their Dukes and Princes being at home, not standing still, but fetling themselves to their businesse or trade, and helping to hatch up their young, they are suddenly choked with the fine of Brimstone, Garlick, the branches of Coleworts, or other pot-herbs, or else by breaking down and overthrowing their combes, they dye through famine.

When you are minded to defend the Bees from the invasion and spoil of Wasps, you must set a pot with some pieces of flesh in it neer the Hive, and when the Wasps (in hope of some prey) are entered, fuddenly clap over the cover; and so destroy them; or else by pouring in some hot water at the top, you may scald them all to death in the pot. In like fort; some do gently breath upon Raisins, Fruit, Sugar, Honey, Oyl, by which, either the Wasps are chased away or by tasting the Oyl do die. And again, some do mix corrosives with Honey, (as for example, Sublimate, Vitriol, Auripigmentum, &c.) that they by taking this venomous or poylon infected drink, may fuffer condign punishment for their intemperate and infatiable gluttony.

Orthestinging of Wasps there do proceed divers and fundry accidents, passions and effects, as pain, disquieting, vexation, swelling, rednesse, heat, sweatings, disposition or will to vomit, bathing and abhorring of all things, exceeding thir stinesse, and now and then fainting or swounding s

Allens wife.

especially when after the manner of venomous creatures, they have infected their stings either by talling the flesh of some Serpents, or by gathering their food from venomous plants. I will now fet before your eyes and ears one late and memorable example of the danger that is

in Wasps, of one Allens wife, dwelling not many years since at Lowick in Northamptonshire, which poor in Walps, of one Author wife, which poor woman reforting after her usual manner in the heat of the Summer to Drayion, the Lord Modame woman resorting after the thouse woman house, being extreamly thirsty, and impatient of delay, finding by chance a black Jack or Tankard house, being extreamly thirty, and impacted and rashly set it to her mouth, never suspecting on the Table in the Hall, she very inconsiderately and rashly set it to her mouth, never suspecting on the lable in the land, and fuddenly a Wasp in her greedinesse passed down with the or looking what imput the drink, and stinging her, there immediately came a great tumor in her throat with a rednesse put fing and swelling of all the parts adjacent; so that her breath being intercepted, the miserable mng and iweiling herfelf twice or thrice round, as though the had had fome Virtiginy in her brain wretently fell down and dyed. And this is known for a truth, not only to me, but to most of the presently remount and a year fresh in their memories, and therefore their authorities as I habitants thereabouts, being as yet fresh in their memories, and therefore their authorities as I take it, is unreproveable.

Now, for fear lest I should lose my self in this troublesome and vast Ocean of Natures admirable Now, for real few a finding for medicinal means, as will defend from their furious malice The vertue of Mallows, and of Althea, (called Marsh-mallow) is notable against the prickings of Wafps. For the foftest and most emollient herb, is applyed as a contrary to a warlike and hursful waips. For the source and anointed with Oyl, either abateth the rage of Wasps, or so blunteth and dulleth their sting, that the pain is not very sharp or biting. Plinylib. 21. copit. 171. And of the and quitett titel titing, that the paint he) will not come near any Man if he be anointed with Orland the juyce of Mallows. For as a fost answer doth frangere iram, and as the Grecians have a saying. the juyce of mattows. Tot as a following the innatural Philosophy we see, that hard things are quailed, and their edge even taken off with foft and suppling: as Iron with a fine, small, and soft quality, and then Adamant Rone with bloud, and the fting of Waips, Hornets and Bees, with Oyl and

what is softer then a Caterpiller? and yet if Actim credit be of sufficience, the same being beaten with Oyl, and anointed upon any part preserveth the same from the wounds and slings of Walos. And of the same vertue is the herb called Balm, being stamped and mixed with Oyl. The same symptomes or accidents do follow the flinging of Wasps, as of Bees, but far more painful, and of longer continuance, to wit, rednesse, and intolerable pain, and Apostumes. And if any be frucken of the Orange or yellow coloured Wasps, especially in a finewy or some sensible part. there will follow a Convultion, weaknesse of the knees, swounding, yea, and sometimes death, abe-

fore I have touched.

Against the stinging of Wasps divers medicines are prescribed by Physicians, but I will speak of fuch only as I have made proof of, and fuch as are confirmed by long experience. Gilbert the Eng. lishman, faith, that Wasps being bruised and applyed to the place affected, do cure their own wounds very strangely. The same vertue peradventure, not only the Scorpion, but the greater part of Insects have, if any one would make any diligent trial thereof. If a man be stinged of any venomous Wasps (which is easily known by the blewnesse of the place, madnesse, raving and finiting of the party, and coldnesse of the hands and feet) after you have given him inwardly some Akriphermacal medicine, the place agrieved must be lanched, or rather opened with a Cautery, so ke ing thus enlarged and opened, the venom must be well fucked out, and the paring or shaving of that earth wherein the Wasps build their nests, must be wrought and kneaded with Vinegar, and so ap-

plyed like a Cataplasm.

A plaister also made of Willow-leaves, Mallows, and the combe of Wasps, is very medicinable for the same, as by the counsel of Haly Abbas I have experimented. The English Northern men, doptepare most excellent emplaister worth gold, against all stings of Wasps, only of that earth whether their Ovens are made, having Vinegar and the heads of Flyes commixed therewith Let the place be very well rubbed with the juyce of Citrals, and withall let the party that is pained drink of the feed of Marjoram beaten to powder the quantity of two drams: or thus, Take of the juyce of Marjoram two ounces of Bole Armony two drams, with the juyce of unripe Grapes fo much as is fufficient, make an emplaister. Another. Anoint the place with the juyce of Purcelane, Beets, or swet Wine, and Oyl of Rofes, or with Cows bloud, or with the feeds of the Spirting or wilde Cucumber (called Noli me tangere) beaten with fome Wine. Thus far Galen. Barley Meal wrought up with Vinegar, and the Milk or juyce of a Fig-tree, Brine, or Sea-water, are excellent for thele griefs (as Dioscorides lib. 8 cap. 20. writeth) if the wound be often fomented, bathed, or soaked with any of them. To drink, give two drams of the young and tender leaves of Bays with harfh Wine, and if the part affected be only anointed with any of these, they are much available. In like fort the deto-Ction of Marsh mallows drunk with Vinegar and water, are much commended, and outwardly sk with Calves fat: Oyl of Bays draweth out the poyfon of Wasps. The leaves of Marsh-mallows (# Actius faith) being bruifed and applyed, do perform the fame.

The juyce of Rue or Balm, about the quantity of two or three ounces drunk with Wine, and the leaves being chewed and laid on with Honey and Salt, or with Vinegar and Pitch, do help mod. Water-cresses. Rosemary, with Barley meal, and water with Vinegar fod together, the juyce of ly leaves, Marigolds, the bloud of an Owl, all these are very effectual against the stingings of Wales as Pliny lib. 31. cap. 9. telleth us; the buds of the wilde Palm-tree, Endive with the root, and wilde

Thyme being applyed plaifter-wife, do help the flinging of Wasps. After the venom is drawn out Thyme penns affected must be put into hot water the space of an hour, and then suddenly by sucking, the place affected must be put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the put into hot water the space of an hour, and then suddenly by sucking the space of an hour, and then suddenly by sucking the space of an hour, and then suddenly by sucking the space of an hour, and then suddenly by sucking the space of an hour, and then suddenly by sucking the space of an hour, and then sucking the space of an hour than the space of a s by jucking, the Plant into Vinegar and Brine; and forthwith the pain will be affwaged, the tumor cease, they must be thrush into Vinegar and Brine; and forthwith the pain will be affwaged, the tumor cease, they must be turned to the venomous humor clean extinguished. Rhazes faith, that the leaves of Night-Rhazes, and the malice of the venomous humor clean extinguished. Rhazes faith, that the leaves of Night-Rhazes. and the mante of the leaves of Night-shade, or of Sengreen, do very much good in this cafe. And in like fort Bole Armony with Vinegar shade, or of Sengreen, do very much good in this cafe. And in like fort Bole Armony with Vinegar and Camphire, and Nuts beaten wish a little Vinegar and Gafforeum.

Allotake the Combe with Honey applying to the place, and hold the grieved place neer the fire immediately, and laying under them a few ashes, binde them hard, and forthwith the pain will be immediately, and lorthwith the pain will be fwaged. Serapio faith, that Savory, or Groffes applyed, and the feed thereof taken in drink, and the Serapiojugged, the lefter Gentory mixt with Wine, are very meet to be used in these griefs; he also commendeth for the same purpose the seaves of Basil, the herb called Mercury, and Mandrakes, with menuetu Ardonnus is of opinion, that if you take a little round ball of Snow, and put it into the Ardonnus. fundament, the pain will cease, especially that which proceedeth by Wasps. Let the place be anointed with Vinegar and Camphire, or often fomented and bathed with Snow-water. Take of Orium, of the feed of Henbane and Camphire, of each alike much, and incorporate them with Rose-water. or the juyce of Willows, and lay it upon the wounded place, applying on the top a linnen cloth, or the payer. of the payer wetted in wine. Johannes Mefue, (who of some is called Evangelista medicorum) pre- Mesus. fribed this receipt of the juyce of Sisimbrium two drams and a half, and with the juyce of Tarteirons make a potion. The juyce also of Spina Arabica, and of Marjoram are nothing inferiour to these forementioned. Aaron would in this grief have water Lintels (called by fome Ducks meat) to be Aaron. flamped with. Vinegar, and after to be applyed.

Conflantine affurethius, that Alcama tempered with Barley meal and Vinegar, and so bound to the Conflantine. place, as also Nuts, leaves of Wall-nuts, and Bleets, are very profitable in this passion. Item, apply very warm to the wound a Spiders web, bruifed with a white Onion, and sufficient Sale and Vinegar, will perfectly cure it. Guil. Placentinus will warrant, that a plate of cold Iron laid upon the Gulichnus wound, or Lead steeped in Vinegar, will do the deed. Gordonius counsel is to rub the place with Sage Placentinus. and Vinegar, and afterwards to foment it with water and Vinegar fod together. Varignana would Gordonius. have us to apply Chalk in powder, and inwardly to take the feeds of Mallows boiled in Wine, Water, Varignana. and a little Vinegar.

Matibiolist much commendeth Sperage being beaten and wrought up with Honey, to anoint the Matthielus. place. Likewife flies beaten and anointed on the place, winter Savory, Water-creffes. with Ovl of Monadica, give most speedy help. Arnoldur Villanovanue assureth us, that any fresh earth, especially Arnoldus de Fullers earth, is very available, and the herb called Poley, used as an Unguent, or else Goats milk. villa nova. And Marcellin Empirious is not behinde his commendations for the use of Bullocks dung, to be ap- Marcellin.

plyed as a poulteffe to the flinged part.

There and many others may any Man afcribe that hath had but an easie tast of the infinity of Phyficks foculations for the store-house of Nature, and truly learned Physitians, which way soever you turn you will minister and give sufficient store of alexiterial medicines for the expulsing of this grief. In conclusion one and the self same medicament will serve indifferently for the curation of Wasps and Bees, saving that when we are stung with Wasps more forcible remedies are required, and for the huntsthat Bees do us, then weaker and gentler are sufficient. In the hundreth and nintieth year before the birth of our bleffed Saviour, an infinite multitude of Waspes came flying into the Market place at Copus, (as Julius witnesseth) and lighted on the Temple of Mars, all which when with great regard and diligence they were gathered together and folemnly burnt, yet for all that they prefignified the coming of an enemy, and did as it were fore-tell the burning of the City, which shortly after came to passe. And thus much for the History of the Wasp.

of HORNETS.

Hornet is called of the Hebrews, Thrbah. Of the Arabians, Zabor, and Zambor. Of the Germans, The sames. A Ein bornauss, Horlitz, Froisla, Osertzwuble. Of the Flemings, Horsele. Of the Frenchmen, Trelhas, Fonlons. Of the Italians, Calauron, Crabrone, Scaraffon, and Galanron. Of the Spaniards, Tabarros & Mosurds. Of the Ilyrians, Irsen. Of the Sclavoniens, Sterfzen. Of us Englishmen, Hornets, and great Wasps. The Grecians call them Anthrenas, and Anthrenous, because with their sting they raise an Anther or Carbuncle, with a vehement inflamation of the whole part about it. The Latines call them Crebrones, peradventure of Crabra, a Town so named in the Territory of Tusculanum, where there is great plenty of them : or it may be they are tearmed Grambrones of Caballus (a Horse) of whom they are first engendered : according to that of Ovid, 13. Metamorphof.

> Pressu humo bellator equus Crabronis origo est. That is to fay; When War-horfe dead upon the Earth lies, Then doth bie flesh breed Hornet flies.

Albertus tearmeth a Horner Apis citrina, that is a yellow or Orange coloured Bee. Cardan laboureth much to prove that dead Mules are their first beginners. Plutarch is of opinion, that they

The curation of their flings.

Salomon.

Gilbertus Anglus.

first proceed from the flesh of dead Horses, as Bees do out of a Bulls belly : and I think that they have their breeding from the harder, more firm and folid parts of the flesh of Horses, as Waspado Their description the more tender or soft. Hornets are twice so great as the common Wasps, in shape and proportion of body much refembling one another. They have four wings, the inward not being half portion or bouy much retembning one do their shoulders, which are of a dark, brownish, and of a Chelinut-like colour, these wings are the cause of their swift flight: they have also fix sect of the a Chettnut-like Colour, there wings and shoulders are of. There is somewhat long, of the colour of same colour and new, that there hanging or bending downwards, crooked and made like a half Moon. Sattron, their eyes and 1008s at the moon, from which grow forth two peaks like unto Sithes or two fickles, nothing varying in colour from their feet. Their belly is as though it were tyed to their shoulders with a very fine thred, the fortheir reet. Their beny is a strong with a brown colour, and begirt as it were with a girdle ward and initial part is altogether yellow, eafily differend and remarkable for those brown or Santon. And werey one of them being much like unto a small triangle, besides they have cer. pricks or speeks, each fides, both before and behinde, by which they can at their pleasure when they lift, either shrink up themselves, or draw and gather themselves together, and with the same again lengthen and stretch out their bodies. They have also neer to their belly on both sides four again lengther and in their tail they are armed with a strong piercing sting, and the same very ve. nomous. They make a found or a buzzing strange noise, morehideous and dreadful then Waste do. They are shrewd, fierce and cruel, quickly angry and wrathful, and although they live in companies together, yet notwithstanding they are ever known to be but of an homely, rude, curfl, and untractable disposition and nature, and will never be brought by any Art or fashioning to lay afide their uplandish wildenesse, (as some herbs will do that are transplanted into Gardens.)

They are belides this of fuch a mischievous malignity and venomous quality, that as some affirm nine of their stings will kill a Man, and three times nine will be able to kill a strong Horse; especially at the rifing of the Dog-ftar, and after, at which time they have a more fiery, hafty, and inflaming nature, and men at that feason, by reason of their large exaltation and sending forth of spirits, grow

more weak and faint.

And therefore it is no marvail though in holy Scripture, they are compared or likened to moft fierce and cruel enemies, which should put and cast forth the Canaanites, Plitties, and Cheviles Erod 23.28. So likewise Ovid in the eleventh Book of his Metamorphof. hath these words, Spiculecubisnum ardentia, The burning stings of Hornets: And Virgil in the fourth Book of his Georgich, alleth them Afperrima, most sharp and violent. Terence (the most eloquent of all Comical Poets) in his Comedy intituled Phormio, and Plantus in his Amphitryo, have this Proverb, Irritavi crabiones, I have provoked or incensed the great Wasps to anger: which I suppose they used as a by-word sgainst the properties, natures, and froward behaviours of women, who being in their wonted fumih mood. if once you go about to overthwart them, or a little to contrary their wilfulneffe, you shall pull an old house over your own head by a further provocation, and perhaps if you get you not the some out of their fight and reach of their clutches, you may chance have somewhat more flying about

you cars then you would.

It is good therefore if you have a Wife, that is Calcato immitior bydra, unquiet and contentions, to let her alone, not to wake an angry Dog : and when a mischief is well quieted and brought asleep, to go your ways and say never a word. Whereas among Bees, their Drones and Kings do want itings; yea, and some Wasps too, as before I have writ : yet notwithanding all Hornets in general, as well the greater fort of them that build their houses in trees, as the leffer fort that drell in the earth, are provided of flings, neither do their Ring-leader feem to be unarmed. For Willy have their P. esidents of their own society, and their Captains general as well as Bees and Wife, what foever Pliny lib. 11. cap. 21. dream to the contrary: which in proportion and quantity are he greater (if you respect the bodies of other Hornets) then either the Captains of the Bees and Walps are in comparison of their subjects. These also spend their time within doors, as the Cappin of Wasps do, not having many but one head to guide and rule over them, lest by banding into pinits and factions, fome civill war (wherein all things are miferable as Tully faith) or other mutiny might arise to their final destruction. They are great vexers and troublers, and even like such as had fworn the death of their enemies, robbers, and theeves: And yet at home they nourish peace, ercelling even the very Bees themselves in their painful, earnest, and willing desire to maintain their flock and common fociety.

For neither do they chide, braul, or contend, nor yet make any ftir or ruftling when any is promoted to any office or place of preferment in their corporation; neither are they diffracted into divers mindes with their bufineffes, neither yet do they raife any tumult, make any uprore, or keep a coil or ruffling at the election of their Prince and Captain general, but with common confent they use but one Table, taking their commons together like good friends and fellows, and whatloever they kill, they carry some part of it home, frankly imparting it to their neighbors, children, and

Neither do they yearly drive and expel forth of the doors to feek new habitations, where they can. (as some Bees deal very churlishly and unnatural with their young) but they contraryale in their bosome defend and keep warm their new springed up progeny and race, building for the greater Houses, and raising of moe Sellers and flores, bording and planking the same in taken never configurable how be sellers and flores, bording and planking the same in taken necessity, never ceasing till they be fully rear'd and made fit for defence and safety. But as for their

King and Captain (whom they exceedingly honor and highly efteem) they make choyce of fuch a King and control of the a King without a Kingdom, nor a Prince without people and possessioner as neither seemeth to be a King without a Kingdom, nor a Prince without people and possession one, and yet he so behaveth himself, and carryeth himself so evenly, as though he had but little to ons, and yes Empire. And yet in largenesse of body and greatnesse of his heart, in stoutnesse and do in the day of Romach and person, he staineth all the rest, carrying away the prize from them tratement when there is Proclamation of War to be made against any forain foes, and that their flags and ancients be displayed by founding his deadly blast, he giveth defiance to his enemies; most nage surregionally befirring bimself more then any of his followers, thewing himself both most vehement, warlike, and skulful in fight, and yet again at home towards his subjects, (like a true noble forit) he is very gracious, gentle, and temperate, tractable, casie to be intreated, and most ready to ipiny. They make for themselves certain holes or dwelling places under the ground, casting forth the earth much after the fashion of Bismires : for you must understand that neither Wasps nor Hornets do fend forth any Swarms as Bees do, but those young Hornets which spring from them now and then, do there remain among their breeders; making their beds or hives much greater, by means of the earth formerly cast out.

They enlarge their combes exceedingly, by adding more and more unto them, fo that of a strong and healthy flock of Hornets, it hath been known they have gathered three or four trays or baskets full of combes. If any Hornets ftray from their own home, they repair to some tree, and there in the top of it make their combes, fo that one many times may very eafily and plainly perceive them. and in these they breed one Captain General, or great Commander, who when he is grown to be great, he carryeth away the whole company, placing them with him in some convenient lodging. Wilde Hornets (as Pliny faith) do live in the hollow crunks or cavities of trees, there keeping them-

selves close all the Winter long, as other Cut-wafts do.

Their life is but short, for they never exceed the age of two years. Their combes are wrought with greater cunning, more exquisite Art, and curious conceit, then those either of Wasps or Bees, and these excellent devisers do make them one while in the trunks of trees, and sometimes again in the earth, encreasing them at their pleasure with more floors and buildings, according to the encrease of their iffue, making them smooth and bright, decking and trimming them with a certain tough or binding fling or gelly gathered from the gummy leaves of plants. Neither do any of the little mouths or entries of their cells look upwards, but every one bendeth downwards: and the bottom is placed upwards, left either the rain might foke through them in long showers or the head of them being built upwards, they might lie open and be the more subject, and exposed to the unruly rage and furious blasts of windes and storms.

If you eye well their nests, you shall finde them all for the most part exactly sexangular or fix cornered, the outward form and fathion whereof is divided with a murry coloured partition: and their membranous substance is much like unto the rinde or bark of Birch, which in the parching heat of Summer cleaveth and openeth it felf into chaps. The stinging of Wasps is for the most part ac-

companyed with a Fever, cauling withal a carbancle, swelling, and intolerable pain.

Imy felf being at Duckworth in Huntingtonshire, my native foyl, I saw on a time a great Wasp or Hornet making after, and fiercely pursuing a Sparrow in the open street of the Town, who at length being wounded with her thing, was presently cast to the ground, the Hornet satisfying her self with the sucked bloud of her quelled prey, to the exceeding admiration of all the beholders and confiderers of this feldom feen combate. Ariffetle, whom I fo greatly reverence, and at whose name Ido evenrife and make curtefie, knows not of a furety how Hornets do engender, nor after what manner they bring forth their young breed. But fince we are affured of this, that they bring forth their young by the fides of their Cells, as Wasps and Bees, we need not doubt, but that they do all other matter after their manner, and if they couple together, they do it by night, as Cats do, or elle in some seeret corner, that Argu with his hundred eyes can never espy it.

Hornets gather meat not from flowers, but for the most part they live upon flesh, whereby it comethe passe, that you hall often tinde them exen in the very daughils, or other ordere. They also proutanter great Flyes, and hunt after small Birds, which when they have caught into their clutches, after the manner of hungry Hawks, they first wound them in the head, then cutting it alunder, or parting it from the shoulders, carrying the rest of the body with them, they betake themselves to their accustomediffight. The greater fort of them die in the hard Winter, because they flore not themselves sufficiently aforehand with any sustaining as Bess do, but make their provision but from hand to mouth, as hunger enforceth them, as Aristotle enformeth us. In like fort Lendin hath well observed, that Hornets both day and night keep watch and ward besides the hives of Bees, and fo getting upon che poor Bees, backs, they ulethem in stand of a Waggon or carriage: for when the filly Bee laboureth to be discharged of his cruel Sitter : the Hornet when he hath fucked out all his juyce, and clean bereft him of all his moisture, vigour, and strength, like an unthankful Guelt and the most ingrateful of all winged creatures, he spareth not to kill, and eat up his foflerate and chief maintainer.

They feed also upon all fweet, delicious, and pleasant things, and such as are not untoothsome and bitter, and the Indian Hornets are fo ravenous, and of fuch an infatiate gluttony. (as Ovidim reporteth) that they flie upon Oyl, Butter, greafie Cooks, all forts of sharp sawce used with meats, and all moift and liquid things, not sparing the very Napkins and Table clothes, and other linen that is any way foiled, which they do filthily contaminate with the excrements of their belly and with their Viscous laying of their egges.

In bellie civ li-

Their ules.

But as they get their living by robbery, and purloining of that which others by the sweat of their brows, by their own proper wits and invention, and without the aid and help of any do take great pains for: so again they want not revenge to punish, and a provost Marshal to execute them for their wrongful dealings: tearmed of some a Gray, Brock, or Badger, who in the full of the Moon their wrongful dealings: tearmed of some a Gray, Brock, or Badger, who in the full of the Moon maketh forcible entrance into their holes or lurking places, destroying and turning topsie-tury in a trice their whole stock, samily, and linage, with all their houshold stuffe and possessing the state of their whole stock, samily, and stock this castless, and say the same than the same trice their whole stock, samily, and stock this castless are said and far head.

Rein and Snow: for if they flie about in greater flumbers, and be oftner feen about any place, then usually they are wont, it is a figne of heat and fair weather the next day. But if about twilight they are wont, it is a figne of heat and fair weather the next day. But if about twilight they are observed to enter often their nests, as though they would hide themselves, you must the next day expect rain, winde, or some stormy, troublesome or boysterous season: whereupon Avienus hath these verses;

Sic & crabronum rauca agmina si volitare Fine sub Autumni conspective athere longo, Jam verspertinos primos cum commovet ortus Virgilius, pelago dices instare porcellam.

In English thus;
So if the buzzing troups of Hornets boarse to flie,
In spacious air bout Autumns end you see,
When Virgil star the evening lamp essie,
Then from the Sea some starmy tempest sure shall be.

Remedics' against their strings.

Furthermore, fince it is most certain that those remedies which do heal the stinging of Wasps, do also help those wounds and griefs which Hornets by their cruel stinging cause, yet not with sand ing, as Aggregator hath pronounced, the Zabor is the Bezoar, or proper antidote of his own burt, is he be oftentimes applyed with Vinegar and Water, Oyl and Cow-dung tempered together. Is like for all manner of soils and earths that are miry and muddy, are much commended in this sie, such as Bacobia applyed to bald Selenia, who was wounded with Hornets, when longing for a little though he jogged and shaked their nests, thinking he had lighted upon some Bees Honey, which the world most elegantly 3. Fasteriam hath described in these verses;

Millia crabronum coeunt, & vertice nudo Spicula defigunt, oraq; prima notant. Ille cadit praceps, & calce feritur afelli: Inclamat socios, auxiliumq; vecat. Concurrunt Satyri, turgentiaq; ora pareniu Rident, percusso claudicat ille genu. Ridet & ipse Deus, limumque inductre monsires; Hic paret monitur, & linit ora luto.

In English thus;

Of Hornets thousands on his head full have,
And on his face their poyson'd spears slick fast,
And on his face their poyson'd spears slick fast,
Then headlong down he fell, and Assessor to sellows cast.
Whiles he for help his voyce to fellows cast.
The Satyres flock came run spaces and did deride
Their sires swollen mouth, whiles Assessor and earth to hide
The wound which be received, and so did heal the same.

If any one be desirous of moe medicines against the perisson and transpiercing stinging of the horn-mad Hornets, he shall finde store of them digested together in the History of Walps: for their remedies are common, belonging as well to the one as to the other, there being no other difference but this, that here they must be given in a greater measure or quantity, and their use ought longer to be continued. And let this suffice to have spoken thus much of such Insects or Cut. was steed vermine as are winged, and live in companies and routs together. Now will I make choice to describe such as are winged and live solitarily, less I should seem to lose my felf in this troublesome and vast Ocean of Physical contemplation.

Of CANTHARIDES or Spanish Flies.

This kinde of Cut-wast is called of the Grecians, Kantharis, and among the Latines it changes not his name. Of the Frenchmen, Cantaride. Of the Italians, Cantarella. Of the Spanietic, Cubillo. Of the German, Grune Kefer, Goldkaefer. Amongst the Belgies or Netherlanders, it is termed Spaniethe Ulieghe; and of us English men, Cantharides, and Spanish Files. I have seen two forts of Cantharides, the one great, and the other small. Of the greater fort some are thick, and long bodyed, which are found among wheat, and these are thick, grosse, and unwieldy, like unto Beels, they are also of sundry colours, and changeable hew, with golden streeks or lines crossing that wings, and these are best to be used in Physick. They of the other lesser kinde, are lean and thin street.

forage and starvelings, broad, hairy, heavy, and sluggish, and for physical uses little worth.

forage and the control of the contro

and manner of the leffer fort have their bodies and heads fomewhat long and hooked, their eyes very black, and hanging out, their wings growing out from the midft of their Loyns, being marked with

two filver specks or pricks, and some few white spots.

They are commonly found in the Summer Season, in the herb that is called Gicharla, or wilde Hemlock. Their feet and legs are very small and long, finely decked and garnished, as it were with a vermillion red, or beautiful purple. There is also another fort of these answerable to the former, in colour of their bodies in every respect, saving that their eyes are green: their head very little; and the hinder part of their shoulders round and crooked.

The third fort have their head and shoulders all one, being so closely and consused to gether, as it they were but one thing and could not by any means be separated, unlesse in imagination, and these are of a rusty colour, and their small pink eyes as black as Jet, their wings as well as their heads are nothing differing in colour, saving that their wings do glister with some strakes of the co-

lour of gold, their feet also are short, and as black as Pitch.

The fourth is very like to the third fort, but it is rather of a greenish, then of a rusty Iron colour, but in all other respects there is no difference to be seen, saving in their magnitude, for this last described is the least of them all. But these kindes of Cantharides as well the greater as the lester, do first proceed not from any beasts, as some have thought, but they rather take their Original from some rotten, stinking, and corrupt moisture and siccity, Titestay are notis toon puroun leiou kai tau ageitau, kai town Sukais prosett to toon Kantharidoon phuson, the meaning where of is, that the whole stock and kindred of Cantharides do bring forth or lay their young in the vile, base, and imperfect force of heat or warmth: and surther in moist Figs, as Aellanus in his ninth Book and thirty nine Chapter, word for word hath exscribed out of wisselves.

They do also breed from a certain little Worm which is found in the sponge of the Dog-bryer (called of the Physicians Bedeguar) and from Caterpillers of the Fig. tree, Popler, Pear-tree, Ash, Olive trees and Roses: for in all these there, be found certain Worms, the very Founders and Parents of Cantharides, but yet in the white Rose these Worms are of much lesser force, power, and smithing with the former.

Cantharides do couple together and generate, but yet not any living creature of their own kinde, but only a little small Worm. They feed upon all manner of pulse and Corn, but especially Wheat, and then they are best for medicinal uses. The smell like unto Tar, and, in their taste they much resulted the Cedar-tree, as Nicander reportesh. Their vertue and quality is to burn the body, to parch and to bring a hard scale or crustinesse upon any part they shall be applyed to, or as Dioscotides saith, to guaw or eat into, to raise blisters, exulcerate and raise an inflammation, for which respect, they might be medicaments as are appointed to heal Leprosies, any dangerous Tetters and Ring worms, or those that be Canterous.

They are applyed to hard, Scurvy, or Mangy nails, being first tempered with some six plaisters or Cerotestending to the same purpose, taking them so clean away, that they fall off by the roots. Some useallo to temper them with such convenient medicines as are warranted to take away Warts, Corns, or any hard knobs or pieces of flesh growing in the hands or seet. Some again use to pulverise Cambarides, and then mixing them with Tar, do make ail Unguent to care the falling away of the hair, or the shedding of it, either in the head or beard, but herein there must be good advice required, lest at any time by their caustick faculty they exulcerate too deep into the sight.

Cantharides mingled with Lime, ferve in stead of a Pen-knife to eradicate and take away those little hard and red swellings rising chiefly in the crown of the head, armpits, or privy parts, called of some Physicians Pani: and some there be again that will adventure a little of them in powder, to give with such Medicines whose property is to provoke Urine: But yet there is hard hold and tough reasoning on both sides, whether they ought to be given inwardly with Diuretikes or no considering that being so drunk, they are accounted amongst strong poysions, tormenting the bladder without any ceasing: othersome again hold the contrary, assuring us upon their own experience, that not exceeding their due quantity, they may be taken with other Correctories, to serve as a stricte to transport them to the place affected, so that you see either side harth his Grengts and ressons.

Justa pari premitur veluti cum pondere libra; Prona nec bac plus parte sedet, nec singit ab illa. That is to say; As when an even scale with equal weight is prized,. Not falls it down this way, or is it that way raised. Property.

But being mingled and wrought up with the juyce of Una Taminea, (which is a kinde of Berry, growing on the herb called Ampelos angria, a kinde of Briony) Sheeps or Goats fewer, there is no doubt but that they do great good. Some of my Masters (soth Galen, the Prince of all Physitians onext to Hipporrases) did use to put Cantharides amongst such medicines as they prepared to move urine, taking only their wings with the feet, but I (saith he) am wont to take Cantharides wholly, as well as some parts of them, and so I judge them the more safe to be used and prevaled this way, especially I misse not to make choyce of such are sound among Corn, and pared this way, especially I misse not to make choyce of such are sound among Corn, and pared this way, especially I misse not to make choyce of such are sound among Corn, and pared this way, especially I misse not to make choyce of such are sound among Corn, and pared this way, especially I misse not consider the monthly terms, and that very effectively.

Pite. Jacus.

Being applyed rightly, they do also provoke the monthly terms, and that very effectually, and Being applyed rightly, they are thought of many to help Hydropical persons, as not only Hipperset, put into Antidotes, they are thought of many to help Hydropical persons of best note and worth and Dioscovides, but also Galen, Avicenna, Rhazes, Pliny, and other Physicians of best note and worth have witnessed it. I cannot here sufficiently enough commend their assured, and approved use, have witnessed with Leaven, Salt, and Gum Ammoniscum, for the diversion of Rhumes or Cabeing commixed with Leaven, Salt, and Gum Ammoniscum, for the diversion of Rhumes or Cabeing commixed with Leaven, Salt, and Gum Ammoniscum, for the diversion of the popular terrhs, the taking away of all Goutish pains, out of the hanch or hip(called the Sciatice of the popular fort), whilest they draw forth and consume from the center of the body, (being there throughly sort) whilest they draw forth and consume from the center of the body, (being there throughly sort of the provided to the surface the matter or offending humours causing these griefs above and deeply impacted) to the surface the matter or offending humours causing these griefs above.

faid.

rous incidentells.

But here I would counsel each one not to be knack-hardy bold, in medling with them, for these or the like intentions: for as they bring both health and help, being duly commixed, and orderly or the like intentions: for as they bring both health and help, being duly commixed, and orderly tempered, not exceeding their dole and first quantity; so again, if you fail in their due and skilful tempered, not exceeding their dole and first quantity; so again, if you fail in their due and skilful tempered, not exceeding their dule and drive men into most intolerable grievous symptomes application or propination, they induce and drive men into most intolerable grievous symptomes and accidents, and otherwhiles to death it self. John Langius settleth down a true and very pleasure and accidents, and otherwhiles to death it self. John Langius settleth down a true and very pleasure and accidents, and otherwhiles to death it self.

There was (faith he) at Bonony in Italy, a certain rich and Noble young man of France, (which Gallus, to use his own words, was Gallo quovis gallinaces falacior) who falling extreamly in love with a certain Maid in the same City, prevailed so far at length through his earnest importunities and incessant follicitations, that at length they appointed and agreed upon the time and place of their meeting to solicitations, that at length they appointed and agreed upon the time and place of their meeting to see their Revels for one night. So this lusty Gallant being thus infinared in the inextricable shynith of her beauteous Phisnomy, searing deadly, less his heart should turn into Liver, or that he might faint and lose his courage before he should attain to his journeys end; in this his doubtful cospiant and lose his courage before he should attain to his journeys end; in this his doubtful cospiant and dangerous skirmushing conflict, like a wise man fearing the worst, casting all dangers short hand what might ensue would needs know of a fellow-souldier, and Countreyman of his, who hand what might ensue would needs know of a fellow-souldier, and Countreyman of his, who had as one may guesse born a standard in the Camp of Venus, what were best to be done, to more him to a more vigorous courage, and to keep his credit for that time, lest either he shouldtum him to a more vigorous courage, and to keep his credit for that time, lest either he shouldtum fently wished him to take some Cantharides in his Broath, which the other at all adventures sould did.

But it was not long before this jolly Yonker felt an itching about his lower parts, then being follower measure, supposed it to be the operation of his medicine that caused this Colt. evil, he without any more ado hyed him to his Love, minding there indeed to draw the matter to a set battly and to end all controversies by dint of sword.

Tune animis opus, Amea, tune pettore firmo.
In English thus;
Of courage then indeed,
Then of stout breast is need.

But yet for all this, in the still of the night, when every one besides were at rest, myreslesse Frank selt his whole body to be pockily torn, and miserably rent with sundry cruel pricings and stingings, seeling moreover a strange tast in his mouth, like the juyce or liquor that issue that the strange tast in his mouth, like a surface or liquor that issue besides himself through the extremity of his pain, virtiginy and giddinesse of his almost besides himself through the extremity of his pain, virtiginy and giddinesse of his life, with inclination to fainting or swounding: so being troubled, tost, and perplexed, all sad, melancholike and male-content, destitute of counsel and comfort, like a silly hist, and an impotent Suiter, and not like a couragious hot-spur, he let his action fall, turing he hack like a Novice and sresh-water Souldier; sull fore against his will you may be sure, but there was no remedy, and so with as much speed as he could, bidding his Love assem, he trudged home to his own lodging; whither being come, and finding no relief, but rather an entrask of home to his own lodging; whither being come, and finding no relief, but rather an entrask of his torments, with a continual burning of his Urine and Strangury, he lamentably besongers, and with weeping and tears most humbly craved and cryed out for help, requiring and with weeping and tears most humbly craved and cryed out for help, requiring

the favour and furtherance, both of my self and of another Physician for the cure: so I being admitted to visit this poor patient, I first gave him some Oyl to drink, thereby to provoke vomiting: then was there prepared a Glyster, made of the herbs hiercurialis, Mallows, and the root of Alibeathen was dissolved Cassa, with Oyl of Wolces and Lillies. After the administring of this, I commanded him to take a good draught of Cows or Goats milk once in every hours space, and if Milk could not be had, then I willed him to take an Almond Milk made Expueless pince, and if Milk could not be had, then I willed him to take an Almond Milk made Expueless pince, and of Mellons, Gourds, and Poppy bruised with the distilled Water of Mallows, and Alkeakmy, and this would I have given to him in good quantity in stead of the Milk if it were wanting.

But after that my fiery Frenchman had recovered his former health with these and the like remedies, and that the unadvised Author of this rash counsel had very humbly intreased pardon at our hands for this his great fault, he protested solemnly with a great oath, that he would never hereaster prescribe any Physick to any man living. Thus far Johannes Langius in his first Book Episola. Medicals. (1914)

There is allo very profitable use to be made of Cantharides, for if you beat them to powder, and convey a little of it into Apples, Pears, Plums, Figs, Peaches, or Quinces: especially those that be fairest and ripest, and those that hang the lowest, finely closing it up again with the pill, which if any Theeves or Robbers of Orchards shall tast of, they fall within a while after into an intolerable burning in their Urine and Strangury, making it only in dropping wise, whereby their these is soon found out, and they well rewarded with sowre Sawce for their sweet meat: And this is an excellent night-spell, and therefore I was loath to pretermit it, but to make you acquainted withall.

There is also another excellent medicinal use of Cantharides, if they be duly, and according to true art administred, and with great warinesse for that passionate grievance, which at this time though some soolish Physicians never heard tell of any such, I will call Pessili infirmitas, yet I may not set it down in English, because I would have but a sew acquainted with secrets. Habeo enim ego singulare quoddam contra penis Languorem remedium, quo cum promiscue utere, utramque multi nobilibus (qui veneris valgo studiosiores videntur) animos orvires addavait absque noxa. Uni tamen inter cateros sic obsisti, ut à venere (cui n mium litarat) sanguinem continuò mingeret, or lipothymia frequenti laboret. Sand niss salis copia in procincu suisset, omninò interiisse venereus pulius, or meritas salacitatis cupidinis panas bissis.

And let this suffice to have spoken of their medicinal vertues and qualities; Now will I proceed to tell you of their ill name, naughty, venomous, and pernicious properties. They are reckoned and fored up in the number of most deadly and hurtful poysons, not only because they cause ero-fionand inflamation, but more in regard of their putresactive quality and making rotten, where-in they exteed. Their juyce being taken into the stomach, and so piercing into the veins, or laid upon the skin outwardly so long till it hath entred the veins, is a most strong poyson, where-upon the skin outwardly so long till it hath entred the veins, is a most strong poyson, where-paint bibs. Itb. Trift. Civero ad Parum, in his ninth Book of his familiar Epistles hath these words, Callis accignate L. Crasso, Cantharidus sumpsisse dictur, as if he purposed by that way to make an end of himself by death. Galen in his third Book De Simplic. medicam. facult. writth thus:

If they be taken inwardly into the body, though but in small quantity, and mixed with other convenent correctories, they do mightily provoke urine, and sometimes corrode and fret the bladder, so that it is as clear as the noon-day, that what things soever do overthrow nature, by readons their extreme frigidity, if they be taken but in a very small quantity, yet will nourish the body: so on the other side, what soever is contrary, repugneth or goeth against humane nature, by means of corrupting or any putresactive quality like unto Canthazides, can never do so. Bartholo-ledus in Italy, who having but outwardly applyed Cantharides to his knee, yet their poyson spreading, in Italy, who having but outwardly applyed Cantharides to his knee, yet their poyson spreading, if he will take the pains to read over Montegnana Consti. 182. Can.

fe, if he will take the pains to read over Montegnana Confil. 182. Cap. 10.

The fame accident hath also befain them, who to be remedied of rough, hard, mangy, or leprie-lie nails, have adventured to apply them to their great toe. So that Cantharides must not rashly be applyed and used, as common deceivers, blinde Empericks, and cousening Land-lopers would make plain Countrey people believe. Pliny relateth a story of one Cossinus a Roman Knight, who was deerly beloved of Noro the Emperor, who having a very dangerous Tetter (a disease in times past peculiar to the people of Esppt) a Physitian of that Countrey in stead of curing, did kill him by giving.

But should rather think that Coffinm dyed by the outward application of Cantharides, because by their burning and caustick quality, they clean eat and consume away filthy Tetters or Ring-worms, Manginesse, Scurvinesse, Lepries, and all hard Callous Warts, Corns, or pieces of shesh that grow in the hands or feet; for I can see no reason why any would be so wilfully blinde, as to give them inseed of Cantharides was unknown to the ancient Physicians of the old world, as by Galenit may appear in his 11. Book De Simplic. Med. fac. and in his sourth Book De villu Acut.

The error of

fome medi-

cine-givers.

The same Pliny (in his twenty nine Book and fortieth Chapter) witnesseth, that Cantharides The same Pliny (in instwenty line Book and that he was forely blamed for offering to make were reproachfully laid to Cato Uticensis charge, and that he was forely blamed for offering to make were reproachtully laid to Calo Otterant, that By, as in Port-fail to any that would give most, so that a price of poylons, and to fell them openly, as in Port-fail to any that would give most, so that a price of poyions, and to left them opening drunk in too large a quantity, or elic applied outward, their price role to threefcore festerties. Being drunk in too large a quantity, or elic applied outward, their price role to threefcore festerties are a second or they produce these or the like supposed. their price role to three core selecties. Being about a single a quantity, or ene applied outward, ly to any part, either too long or too deep, they produce these or the like symptomes, accidents,

deflects.

The party to whom they are any way given, feeleth a pricking pain and torment in his bowels and The party to wnom they are any way given, to the lower parts about the Bladder, Reins, and the inward parts, extending from the mouth down to the lower parts about the Bladder, Reins, and the and effects. inward parts, extending from the mount and the do also ulcerate the bladder very dangerously, infla-places about the waste and short ribs: they do also ulcerate the bladder very dangerously, inflaplaces about the wate and more than the fame with a vehement apostumation: after this, they ming the yard, and all other parts neer the same with a vehement apostumation:

Me bloud, and little pieces of little.

Otherwhiles there will follow a great lask or Bloudy-flix, fainting and fwounding, a numneffe or Otherwhiles there will follow a great lask or Bloudy-flix, fainting and fwounding, a numneffe or piffe bloud, and little pieces of flesh. And out of ancient Rhazes (who practifed Phylick one hundred was the fixth of the first Chapter). Dioscorides, and the first chapter. And Lib.; de Temperam. cap. 3. And out of ancient Rhazes (who practifed Physick one hundred years, if truth de Temperam. cap. 3. And out of anisons one be either affected or infected with any accidents, by be truly related) Tit, 8. chap. 17. If any one be either affected or infected with any accidents, by means of Cantharides, Diojeorides doth thus cure them, as you may readily finde in the Book and

napter perotection.

First of all he canieth them to vomit often and much: and after that he prescribeth Glysters to Chapter before cited. be made for the fouring of the belly with Nitre, and to preferve the bladder inwardly, to take Milk be made for the fourthing of the ben'y what and then he would have the matter of Glysters to be somewhat different from those and Psyllum: and then he would have the matter of Glysters to be somewhat different from those and rysuum: and then he would have the made of Barley water, Marsh mallows, the which were taken in the beginning: as namely to be made of Barley water, Marsh mallows, the white of an Egge, the Mulciling of Line-seeds, Water of Rice, the decoction of Fenugreek, Hywhite of an Egge, the Mulcining of Line-reeds, yvalet of Ace, the accortion of renugreek, Hydromel, fat Broaths, Oyl of Almonds, the fat of a Goofe, and the yelks of Egges. And inwardly to take at the mouth, he biddeth them to use Cows milk, Hydromel, the grains or fruit of the to take at the mouth, he biddeth them to use Cows milk, Hydromel, the grains or fruit of the to take at the mouth, he greater and the leffer fort, Wine fod to the half, Ducks fat, a decoction with fome diuretical feeds (namely with the four greater cold feeds, which are Cucumbers, Gourds, C. trals, and Melons) and likewise some decoction made of Figs, with syrup of Violets. Oyl of Quinces is highly commended of some as a proper and special Antidote in this case, and so is Oyl of Lillies,

Rhazes counsel is, after the taking of some Glysters made of any fat broaths, to make an injection and Terra Samia. into the yard with Oyl of Roses, and the sick person to sit in a warm Bath. Tit. 8. Chap. 17. The Writers and Authors of Physick and Philosophy cannot agree, in what part of the Cambardestheir poyfon chiefly lurketh : for fome will have it to be principally in the head and feet, and others again poyron emeny meneral and yet they all agreeupon this point, that in what part of the body foevertheir will none of that: And yet they all agreeupon this point, that in what part of the body foevertheir poylon is feated, that their wings are a foveraign remedy and prefervative, and if they be waning, poyion is reaceu, that their wings are though they be never fo poyfonous, yet have they their own that their poyfon is deadly: fo that although they be never fo poyfonous, yet have they their own remedy which in themselves they contain and carry about: Thus saith Pliny in his 11. Book and 35.

And peradventure for the same cause, Galen in his eleventh Book, which he intituled De Simple. Medicament. facultatibm, adviseth us expresly and learnedly, that Cantharides should be taken whole as they are, and fo to be used either for inward or outward uses. For why it is far better, even in the outward application of them, that they should more gently and flowly corrode gnaw, or fretained, and that their burning vertue and quality should be a little corrected and weakened, then to perform their full effect to the great danger of the patient, and many times to his utter undoing and destruction. Therefore they are clean out of the way, who when they would use them for any inward cause, do cast away their wings and feet, whereas indeed they ought to take all of then, not rejecting any one part of them. For being given whole, they need not fo much any corredities to bride and leffen their powerful operation in regard of their wings and feet, the proper refillers and the leften their powerful operation in regard of their wings and feet, the proper refillers and

The fafest course is to use all, and every part of them without exception, unlesse you would expellers of their own or other poylon. have them to corrode, fret, inflame, or burn any part. Lyom Neapolitanus is of opinion, that Purcelane is their proper counter-poyfon, which vertue Pliny in his twentyeth Book, Chap.13. ascribeth to the herb called wilde Basil: who also many ways commendeth Acelum Sophilium, Oleum Oenanthium, Cows milk and brethes made of Goats flesh for these intentions, in his 23. Book, Chapter the second and fourth, and likewise in his 28. Book and tenth Chapter, And for our History of Cantharides, let this for this time suffice, which I much wonder that the fimous learned Geffier hath in such deep silence passed over, never so much as mentioning them; whereof notwithstanding so many Authors, both of the Ancients and Neotericks, do so much

ring.

Many moe authorities could I have alleadged concerning this my discourse of Cantharides, but
Many moe authorities could I have alleadged concerning this my discourse of too much that I suppose it a labour as endlesse in toyl, as needlesse in use; the one savouring of too med curiofity, the other of a frivolous affectation: fo that I hope even amongst the whole College of Physicians, wherefoever in England (if their ears be not too dainty) to finde some few grains of of Phylicians, which and fuch curteous conftruction, as that I may neither be charged with parties good words, and fuch curteous conftruction, as that I may neither be charged with parties good words, and fuch curteous conftruction, as that I may neither be charged with parties good words, and fuch curteous conftruction, as that I may neither be charged with parties good words, and fuch curteous conftruction, as that I may neither be charged with parties good words, and fuch curteous conftruction, as that I may neither be charged with parties good words. their good words, (where it is meet I should be mute) nor be suspected of unsufficiency, for not pursuing where I can finde no good footing.

of CATERPILLERS, or PALMER-WORMS, called of some Cankers.

TOW I am come to speak of Caterpillers, sometimes the destroyers and wasters of Egypt: as well Their name: in regard of the great difference that is found in their feveral forts, as for their great dignity and use, wherein some of them are most notable and excellent. Some think that Eraca, which is Englifted a Caterpiller, hath his derivation ab erodendo, which is not altogether improbable. For they gnaw off and confume by eating, both leaves, boughs, and flowers: yea, and fome fruits alfo, as I have often feen in Peaches.

Oviding the famous Poet, stileth them by the name of Tinea agresses :

Quaque solent cania frondes intexere filis. Agrestes Tinee, ves observata calonis, Feraci mutant cum papilione figuram. In English thus:

And those wilde Methes by bubandmen observed, Which fold themselves in boary springing leaves, Gainst force of famine, and storm to be preserved, A shape from fruitful Butterflies receives.

The Grecian call a Caterpiller Kampe, by reason of his crooked winding or bending pace in was ving fort, whereby in creeping they bow, wry, and lift up themselves. Of the Hebrews it is termed Ghazain, because it sheareth, pilleth, and devoureth the fruits of the earth, as Kimhi upon the first of fol writeth. The Italians call it Rugaverme, and Brucho, for so Marcellus Virgilius upon Dioscorides saith exprelly, that in his time all the people of Italy, named it Eruca, Bruchi. The Spaniards term it Orusa. The Frenchmen, Chenille, and Chanepeleufe. Of the English they are commonly called Caterpillers, of what kinde loever they be of. But the English Northern men, call the hairy Caterpillers, Oubuts, and the Southern men usually term them Palmer-worms. Of the Polonians it is called by the name of Ruthensenka. In the German tongue Ein Raup. In the Belvian Ruipe, Of the Illyrians Gassenica. And Silpolicys will have it called Certris, and Cedebroa.

If Ishould go about to describe and set down all the differences and varieties of Caternillers. I Their diffemight perhaps undertake an endlesse and tedious labour. I think it therefore fittest to bend my slen- tences. derskil, and to imploy my best forces, in speaking of such as are more notable and common with us in this Countrey: For fome of them in touching are rough, hard, and stiffe; and othersome again, are soft, smooth and very tender. Some are horned either in the head or in the tail; and again others have no hornsatall. Some have many feet, and some fewer, & none at all have above fixteen feet. Most of them have a bending fwift pace, and like unto waves, and others again keep on their way very plainly, foft-ly, by little and little, and without an great haft. Some change their skins yearly, others again there bethat neither change nor cast their old dry skins, but keep them still. Some of them ceasing altogether from any motion, and giving over to eat any thing at all, are transformed very strangely into a kinde of vermin or worms, who being covered with a hard cruft or shell, lie as it were dead all the Winter; and from these come in the beginning of hot weather, our usual Butter-flies.

Many of these Caterpillers are bred of the egs of Butter-flies; and some again do breed in the leaves of trees, of their own proper feed, being left there in the time of Autumn, included in a certain web, or elfe by means of the dew or air, therein thut and putrefied, as commonly the little hairy Cankers or Caterpillers which are so full of feet, do breed. Besides, some of them do feed on

leaves, some on flowers, and there are some which devour fruits.

All smooth Caterpillers which are not hairy, are of a yellow or green colour: fome again are found of a reddish colour, or brownish, or else they be of sundry hews. But of all others, the most excellent is the green coloured Caterpiller, which is found upon that great bushy plant, usually tearmed Privet, or Primprint, which hath a circle enclosing round both his eyes and all his feet, havingalio a crooked horn in his tail: these Caterpillers are blackish-red, with spots or streaks going ovenhwart their sides, being half white, and half purpelish, the little pricks in these spots are inclining to red: The rest of their body is altogether green.

There is another Caterpiller feeding altogether upon Elder-trees, not much differing from the former, faving that this is altogether of a green colour, and wanting those overthwarting cross white

marks or spots, and the other small white pricks which we described in the former.

There is also a third fort of green Caterpillers, which when Autumn or the fall of leaf draweth on, are turned into a certain sheath or case, being of a very hard and horny substance, of colour very brown, and this feedeth altogether upon Pot-herbs, especially those that be soft, as Lettice : whereuponit may not unfitly be termed, Eruca Lactucaria.

Laftly,

L113.

Of the Caterpiller.

Laftly, there is to be feen another fort, of a green colour, which is the least of them all, and this Lattly, there is to be item another lotte, or a But in the Oke) there drawing out their web, by means kinde liveth and feedeth upon trees, (especially in the Oke) there drawing out their web, by means kinde liveth and feedeth upon trees, as live as live as live as liveth and the heads of travallars. kinde liveth and recent upon trees, they eafily fall down upon the heads of travellers and paffen.
of which being firred and shaken, they eafily fall down upon the heads of travellers and paffen. of which being hirren and maken, they say agreements. And this kinde of Caterpiller is too gers by the way fide, cleaving to their hats and garments. And this kinde of Caterpiller is too gers by the way mae, cleaving to their mee and when cold weather approacheth, they fold them, well known and found in the Summer time, and when cold weather approacheth, they fold them. well known and tound in the summer time, and with this being included in a greenish feabard felves into a rude, plain, and nothing curious web. And thus being included in a greenish feabard or case rending to red, they all die in Winter, and all these have ten feet, as all they have that go or case rending to red, they all die in Winter, and come to them that are vellow. or case tending to rea, they are the leave the green, and come to them that are yellow, there is bending themselves upwards. But to leave the green, and come to them that are yellow, there is bending themselves upwards. But to leave the green, and the word soundeth, a very elegant and fine to be found a certain Caterpiller called Vinuls, being as the word soundeth, a very elegant and fine to be found a certain Caterpiller called Vinuls, being as the word soundeth, a very elegant and fine to look upon, and passing beautiful r. and this kinde have I often found amongst Wislows, the located mounts are somewhat vellow, his words. infect to look upon, and paining leaves. His lips and mouth are fomewhat yellow, his eyes black as full favously feeding upon their leaves. His lips and mouth are fomewhat yellow, his eyes black as full favously recaing upon their reach, the feet and hinder-part of the body, of a green graftic bue, a cole, his fore-head purple coloured, the feet and hinder-part of the body, of a green graftic bue, a cole, his fore-nead put pie colours, the whole body is as it were flained and dyed with thick his tail two-forked, and somewhat black. The whole body is as it were flained and dyed with thick he tail two-torken, and tomewhat hack and shoulder-blades, as it were in form of a Bargolian Red-wine, which runneth alongst the neck and shoulder-blades, as it were in form of a Bargolian crosse, or of the letter X, made crosse-wise down unto the tail with a white line, addeth no small grace to the other parts.

There is yet another Caterpiller of yellow blackish colour, called Porcellus, we may in Eng. lift call it Pigs-snout, in respect of the fashion of the head, especially the greater fort of these, for the leffer have round white specks upon their sides, and these live and are altogether to be found amongst the leaves of the Marsh Trifoly, which they consume and devour with an incredible celeamongst the seaves of the shade, (which the Italians call Belladena) there is found a fmooth Cateroll rity. In the wilde Night-shade, (which the Italians call Belladena) ler of a yellow-greenish colour, having a horn in his fore-head the length of a finger, which Hirm

The description of Pityocampes.

Cardan, the learned Physitian, reporteth that he had often feen. The hairy Caterpillers are most mischievous and dangerous amongst them all, and these are either thick or thin haired, and the most venomous is that which is called Pityocampe, whose biting is poyfont and this is ever found in the Pine-apple-tree, being as thick as three little fingers, and three fingers long being laid a croffe. They confit of eleven flits or cuts betwixt the head and the tail, and they have fixteen feet, according as all other hairy Palmer-worms have. That is to fay, neer the had on both fides, there, in the midft of their body on both fides, four, and at the end of the tall on both fides, one. Their former feet are crooked and small, with which they feel, try and affly the way whether it be passable or no, their other feet are broader, with many jage and notcher like a faw, to take the faster hold, and stay with furer footing upon smooth and stippery leaves. Then head is much like a Pifmires, and the reft of their bodies like other common Caccepillers. They are rough, and full of briftly ftanding up hairs on all fides, and those in their fides are white, but those on their backs do fhine, being very bright and gliftering, the midit whereof is garnified with may spots, as though it were full of eyes.

Their skin is black which is foon feen, their hairs being cut or taken clean away. All their hais are but small and yet they sting more vehemently then any nettle, whereby is canfed intolerable pass, burning itching, a Fever, and much disquietnesse : when as their poylon is suddenly in a moment feet and conveyed without any manifest appearance, or sense of any wound to be judged by the eye, usto those parts that are next the entrails, as the heart, liver, and the rest. They weare their west after a fine and exquisite manner, as Spiders do, drawing out in length, framing and trimming in good order, their hairy small threads. And under these when eight draweth on, they lie as in that own proper tent and pavillion, as well to avoid cold, as the different modities of surjous blass and forms : for the matter and substance of this their tent is so handsomely wrought, fo firm, hift, clammy and fure, that they neither care for furious windes, nor yet any rain or form will ever fole through. Besides, the largenesse of this house is such, and of so great receit, as it will easily to ceive and lodge many thousands of Caterpillers. They make their nests or buildings in the highest branches of the Pitch and Pine-trees, where they live not folitarily (as other Palmer-worm 6) but in flocks or companies together. Which way foever they take their journey, they are fill spinning and drawing out their threads for their web, and early in the morning (if it be likely to prove fair) the younger fort by heaps attend the elder, and having first bared and robbed the trees of all their boughs and leaves, (for they make clean riddance of all where foever they come) they afterwards dexteroully bend themselves to their weaving crast. They are the only plague and destruction of Pitch and Pine-trees, for unto any other roziny or gummy trees they never do harm.

There is great plenty of them to be found in the Mountain of Athes, fituate betwist Methodis and Thrace, in the Woods of Trident, and in divers Valleys beyond the Alpes, in which places there is store of these fore-named trees, (as Matthiolm faith.) They are doubtlesse most poysonous and venomous vermine, whether they be crushed outwardly with the hands, or taken inwardly into the body: yea they are so known, manifest, and so never failing a poyson, and so esteemed of in times past, as that Ulpian the famous Lawyer, interpreting the Law Cornelia de Sicariis, or privy murther ers, that he in that place, calleth and efteemeth the giver of any Pityocampie in drink or otherwise to any one, to be doomed a murtherer, and their punishment to be equallized. Sea. Alium f. ed Ly.

As foon as this kinde of Caterpiller is received into the body, there followeth immediately a great Corn. de sic. pain, extremely tormenting the mouth and palate, the tongue, belly, and stomach are greyoully inflamed by their corroding, and gnawing poylonous quality, besides the intolerable pain there

ceiver feeleth, although at first the party feemeth to feel a certain pleasant itching, but it is not long before he perceiveth a great burning within, loathing and detesting of meat, and a continual defire to vomit and go to the fool, which nevertheleffe he cannot do. At length, unleffe speedy fuccour be given, they so miserably burn and parch the body, that they bring a hard crustinesse, skurfle or scald upon the stomach, as though the sides thereof had been plastered with some hard thards, or other like things, after the manner of Arfenick, as Dioscorides, Aetim, Pliny, and Cellus do affureus. In like manner Galen in his eleventh Book Simp. cap. 50. and Avicen 505. cap. 25. have testified the same.

And for this cause Atim and Aegineta do say, that it is nothing wholesome for any to sit down to meat, to spread the Table, or make any long tariance under any Pine tree, lest peradventure through the favour or smell of the meats, the reek or vapour of their broaths, or noise of men, the Pityocampies being disturbed from their homes and usual resting places, might fall down either into their meats beneath, or at least-wife cast down, or let fall any of their feed, as poyfonous as themselves. They that receive hure by them, must have recourse to those preservatives and medicines, as were prescribed to those that were poysoned by Cantharides, for by them they are to be cured, and by no other means. Yet for all that, Oyl of Quinces is properly commended to vomit withall in this case, which must be taken twice or thrice, even by the prescript of Diescorides and Active. They are generated, or to speak more aptly, they are regenerated (after the manner of Vine-fretters. which are a kinde of Caterpillers, or little hairy Worms with many feet, that eat Vines when they begin to shoot) of that Autumnal seed of theirs, lest and reserved in certain small bags or bladders within their webs.

There is another fort of these Caterpillers, who have no certain place of abode, nor yet cannot rell where to finde their food, but like unto superstitious Pilgrims, do wander and stray hither and thither, and (like Mice) confume and eat up that which is none of their own : and thefe have purchased a very apt name amongst us Englishmen, to be called Palmer-worms, by reason of their wandering and roguish life, (for they never stay in one place, but are ever wandering) although by reason of their roughnesse and ruggednesse, some call them Bear-worms. They can by no means endure to be dieted, and to feed upon some certain herbs and flowers, but boldly and disorderly creed

over all, and tast of all plants and trees indifferently, and live as they lift. There are fundry other forts of these Cankers or Caterpillers to be found, in the herbs called Cranesbil, Ragwort, Petie-mullen, Hops, Coleworts, Hasels, Marigolds, Fennil, Lycorice, Basil, Alder, Nightshade, Water-betony, Garden-spurge, and other forts of that herb; in Elm-trees, Per-tres, Nettles, and Gilliflowers. Yea there is not any plant to be found, which hath not his proper and peculiar enemy and destroyer: all which because they are so commonly known of all. though perhaps not of all observed, I will (left I should feem to be infinite) passe over with filence. But yet I will adde a word or two of a strange and stinking Caterpiller, which it was never my hap as yetto fee, described by Conradu Gesner, in these words following: This stinking Caterpiller (faith he) is very like to those that are horned, but yet it wanteth horns, differing from them all in colour. I first espyed it creeping upon a wall toward the end of August, Anno 1550. there cometh from it a lothfome and an abominable favour and fmell, fo that you would verily believe it to be very vendmous. It went forwards very frowningly, and with a quick, angry, and despightful countenance, as it werein bending wife, the head always ftretched up aloft with the two former feet : I judge fier to be blinde. She was the length and breadth of a mans finger, with a few scattering and rugged hairs, fomewhat briftly and hard both on Her back and fides, the back was very black, the colour of her belly and fides was somewhat red, enclining to yellow, and the whole body was distinguished, divided, and eatily discerned with sourteen joynts or knots, and every joynt had a certain furrow like akinde of wrinckle running all along the back. Her head was black and somewhat hard : her mouth crookedly bending like hooks, having teeth notched like a faw, and with these teeth as with pincers or nippers, what soever she laid hold on, she (as samished) did bite. She went on sixteen feet, as for the most part all the sorts of Palmer-worms do. Without doubt, she must be concluded to be exceeding venomous.

The learned man Vergerus, took it to be a Pityocampe, and others thought it a Scolopendra: but that could not be, by reason of the number of her feet. I could hardly with much ado endure her tile smell, till I had drawn out her description. She so insected two Hot-houses with her abominable avour and flink, that my felf and they that were with me, could not endure in the place. Thus far Gifner, as I have to shew out of certain scroles of paper of his, never as yet imprinted. Now will I proceed to discourse of the original, generation, aliment, and metamorphosis of Ca-

terpillers.

Chare liber, nostrûm testis benefide laborum, Nemapurpureo suffuderis ora rubore Agrefies abacis tineas ft expressero noftris, Vermiculofq; levem qui in thecam vellera mutant. Hi signidem artisicis prudenti pollice Divi Finguntur, tenui qui non tenuatur opella

Et qui vermiculis, desetre miranda potentis Signa sue prodit, potius quam corpore vasti Molifero Barrhi, tumido vel robore Cett Squamantifq; aliis; qui lata per equota tentant Fulmineas fine mente minas : & noftra profunde Lintea qua mergant, largo mare gutture ruciant.

Deer Book, a witnesse of my labour true, Be not ashamed to write of little worms,

Nor Caterpillers, which from base things ensue, And into eafie cafes again returns : For thefe are fram'd by hand of God most wife. Never abased in any work so small :

Which may be Englished thus; For out of Worms bie wonders do arife. As well as from great Beafts fo tall, Tower bearing Elephant, buge Whale. And other monfters frimming in the Seas Ireful beafts, in bills and deepeft dale, Death threatning to all that them displease.

For fo I think it best to begin with the verses of a good Poet, who indeed did see and admire the For 10 1 timisk it best to begin white the Almighty, in the generation and breeding of Cainscrutable wisdom and divine Providence of the Almighty, in the generation and breeding of Cainscrutable wisdom and divine Authors Ishoured to expresse and set down diversity. inferutable whiten and divers. Authors laboured to expresse and let down diversly, I know not terpillers. Which whilest divers. Authors laboured to expresse and let down diversly, I know not terpillers. Without without thrust us into; for swarving themselves besides the way, although what clowds of errors they have thrust us into; for swarving themselves besides the way, although what clowds of errors they have caused in these mysteries of Philosophy, they have caused others they pretend a matchlesse understanding in these mysteries of Philosophy, they have caused others they pretend a matchlesse and to be blinded with the masterados of the they pretend a matchieffe direction and to be blinded with the mascarados of absurdicies. And to tread awry as much as themselves, and to be blinded with the mascarados of absurdicies. And to tread awity as much as the in the monument of former times, I will here produce Arifiales opinionity, if we will begin to rifle in the monument of former times, I will here produce Arifiales opinionity, if we will begin to rifle in the monument of former times, I will here produce Arifiales opinionity, if we will begin to rifle in the monument of former times, I will here produce Arifiales opinionity. first, it we will begin to this in the monument of really faith, that they take their beginning from on in his fifth Book, Histor. cap. 19. who there expressly faith, that they take their beginning from on in his fifth Book, 121181 and namely of Radish and Coleworts, by means of their small seed of gette green leaves of herbs, and namely of Radish and Coleworts, by means of their small seed of gette green leaves of Autumn Sallian Coleworts and of Autumn Sallian Coleworts. the green leaves of the too, and mainted of generation, being like unto Millet-feed, which is there left about the end of Autumn, from which female neration, being like unto Millet-feed, which is there left about the end of Autumn, from which female neration, pening and of these attele Worms in the space of three days a Caterpiller is formed, about Worms proceed; and of these attele Worms in the space of three days a Caterpiller is formed, about worms proceed. and or toward the later end thereof, which growing to their due quantity, and wellfed the Spring time, or toward the later end thereof, which growing to their due quantity, and wellfed the Spring Line, of the state o

Pliny is of this minde, that Caterpillers fetch all their pedegree, race, parentage and birth, from a both form and life. dew thickned and incrassated by the heat of the Sun, and so still lest behinde in leaves: and Amaldu de Villa nova is of the same judgement. Othersome derive them wholly from Butter-flies, and will have them to proceed of no other beginning, which as foon as they are crept out of their hard will mave them to proceed a state of the winter, aftoon as Summer and thells or feabbards, wherein they had lain as it were dead all the Winter, aftoon as Summer and warm weather draweth on, they cast certain eggs either under or above the leaves of certaintens, which egges according to the quantity of their bodies, are either greater or lesser, and some of these shells wherein they are included, are of a sky colour; others yellow, white; black, green, orred; and so being at length about fourteen days quickned and nourished with the lively and kindely but of the Sun, their shell-house being broken, first cometh forth small Caterpillers, like unto little Worms, faving that they are diverfly coloured, who at their first appearance, being as it should seem very hungry, do altogether bend themselves to devour and eat up both leaves and flowers, especially

of those trees and plants whereon they were whilest they were in egges.

But I am of opinion, that not only this, but by divers other ways and means they may proceed and increase, for although the doctrine of Aristole in this point seemeth to be unsavoury, and nothing relishing divers taites, because he affirmeth, that that little Worm which is found upon Cole. worts, doth turn into a Caterpiller: yet for all that, it is not so much without smack of sak, or so abhorrent to reason as they would make some believe. For Nature, as she is able, and doth produce and bring forth a living creature from an Egge, so likewise from a Worm she breedeth a more perfeet living creature, by many degrees; and that not by way of corruption, but by way and metans of her excellent perfection. For although a Worm afterwards be not that thing which before it was, (fo far as is apparent to outward fense) yet for any thing we can gather or perceive, it is that which it was, and this That, is more by a great deal now, then before it was. For a Worm dyeth 100t, that a Caterpiller may thereby spring, but to the old body, Nature addeth a greater magnitude: for example, feet, colours, wings: to that whileft life remianeth, it acquireth other parts and other

There be some also that deride the opinion of Pliny, because he contendeth that Caterpillers have their beginning and production from dew. But it may not be denyed in my conceit, that some imperfect small creatures are bred and take life from dew, and not without great reason. For the Sun by his kindely heat and warming quality, worketh and acteth, being as it were the form, and the moissure or humor is Passive, as the matter or the subject, for the heat of the Sun is different from that of the fire: for it either quickneth and inspireth with life, or at least-wise conserveth and maintaineth our life, by means of likenesse, proportion, or symmetry, wherein our live and spirits respect each other. Besides, there is nothing more nourishing then Dew, for with it only some certain small creatures are sed, and do thereby live: which thing the divine Poet very well observed, when he uttered these words;

Quantum nos noche reponit.

So that in respect that it is humour, it is matter, in respect it is thin, it pierceth and easily enter in, and in respect it is attracted and throughly concocted by the Sun, it is the apter made to got ration. For the preparation of the form, carryeth with it the matter or fluffe, as his mate and companion: So these two meeting together, there consequently followeth the quickning or these life of some one creative. life of some one creature. And not only are some Caterpillers the off-spring and breed of dee, it common experience can witnesse, but even the greatest pare of Caterpillers do fetch their flockand pedegree from Butter-flies, unlesse it be those that live upon Coleworts and Cabbages, and those pedegree from Vine-fretters, with some few other. For those that live and breed in Vines, (called that are called Vine-fretters, with some few other. that are caused vines, do proceed from dew, or fome dewy and moist humor, which is included in ther webs, and there grown to putrefaction. For then do they fwarm fo exceedingly in fome then webs, as I dare neither affirm, nor otherwise imagine, but that they must needs have such Countries, are all from putrefaction. And this for the most part happeneth when the Eastern a mighty increase from putrefaction. a mighty inches and that the warmth of the air furthereth and hafteneth forwards any corruption.

All the whole pack of them are great destroyers and devourers of herbs and trees: whereupon Phipps the Parasite, as Atheneus saith in Pythogorifia, braggeth of himself in this wife, Apolausa Philippu the rate of the state both Thyme and Pot-herbs. And to this sense speaketh Martial, Erucam male paseit bortus unam. A Garden hardly and flenderly can suffice to feed one Caterpiller. I think he meaneth, when the time of their waiting and devouring is gone and past, for they commonly leave but little behinde. For that being past, they go wandering hither and thither, up and down uncertainly, wasted and hungerharved, and fo at length pining away by little and little through famine, fome feek them fit places within, other-fome above the earth, where they transform themselves, either into a bare and empty

bag or case, or hanging by a thread into an Auselia covered with a membrane.

If this happen in the midft of Summer, the hard rinde or shell wherein they are inclosed being broken, about the time of 24. days, there flieth out a Butter-fly : but if it come to passe in the midft, ortoward the end of Autumn, the Aurelia continueth a whole Winter, neither is there any exclusion before the vernal heat. And yet notwithstanding, all Caterpillers are not converted into Auteliet, but some of them being gathered and drawn together on a heap (as the Vine-fretters) do grow at length to putrefaction, from which sometimes there falleth as it were three blackish Eggs, the true and proper mothers and breeders of Flies and Cantharides. When the Butter-flies do joyn together very late, or after the time it ought to be, they do lay or cast their Egges, which will continue vital, and that may live till the next Spring, (if a diligent care be had of them) as well as is often feen in Silk-worms, whose Egs the Spaniards fell, and that very usually by whole ounces and pounds. I have now according to my cunning, discoursed of the transmutations and variable changes of Caterpillers; it followeth next that I write of the qualities and use of Caterpillers, together with those preservatives which experienced Physitians have warranted for true and

All Caterpillers have a burning quality, and fuch as will readily fetch off the skin, and flee it Theirqualities. quickly, and raise blifters. If any one drink the Caterpiller that liveth in the Pitch trees, there will forthwith follow a great pain about his mouth and jaws, vehement inflamation of the tongue, frong groing and wringing of the Stomach, belly and intestines, with a sensible itching about the inward parts, the whole body is as it were burned and scalded with heat and hot vapours, and the stomach abhorrethall meat: all which are to be remedied with the fame means, as those that have taken Cantharides. Yet properly, (as heretofore I have touched) Oyl of Quinces given to cause vomita ing, is the best and safest. And if we may credit Pliny, new Wine boyled to the third part; and Cowsmilk being drunk, are very effectual. There is not any one fort of Caterpillers, but they are malign, naught, and venomous, but yet they are least hurtful who are smooth and without hairs; and the most dangerous of all the rest, is that which heretofore I termed a Pityocampe, whose poyson for the most part is deadly.

The daughter of Celius Secundu living at Bafil in Germany, (as Gesner saith) when she had unwarily and greedily eaten some Colewort-leaves, or Cabbage in a Garden, and with them some Caterpillers, after a strong vomit that was given, ther belly began to swell, which swelling, having continued these many years, could never as yet receive any cure. If you will have your Gardens and Trees untouched and preserved from their mischievous quality, you must first take clean away in the Winter time their webs, or any part thereof (though never fo little) that you can finde cleaving to the bare boughs: for if you let them alone till the Spring, you shall sooner see them, then findethem removed, for in a thort space of time they devour up all that is green both leaves and flowers. Some use to anoint their trees with the gall of a green Lizard, and some with a Bulls gall, which as fome constantly report, they can by no means away withall.

The Countrey people choke them with the vapour of a little Brimstone, with straw being fired under the tree, and so to smoother them. Some there be that make a sumigation with Galbanum, Hirts-horn, the shavings of Ivory, and Goats hoofs, and Ox-dung. Didymis in Georgicis faith, that if you bare the roots of your trees, and belimear or foyl them with Doves dung, they shall never be

hurt by any Worms.

I should willingly have omitted, and not renewed with any fresh discovery Columellaes remedy againft Caterpillers, (or rather the immodest deceit and deluding trick of Democritus,) unlesse experience, which is, Iterata ejufdem evenim observatio, a repeated observation of the fame eyent, had ap-Proved the verity thereof, especially in the Countrey of Stiria. And Palladim in his first Book ch. 35. and Constantinus neer the end of his 11. and 12. Books, whose words be these;

At si nulla valet medicina repellere pestem, Daidanie veniunt artes, nudataque plantas Fanins, que justis tum demum operats juventa

Legibm, obsecono manat pudibunda eruore, Sed resoluta sinue resoluto mæsta capillo Ter circum areolas, & figun ducitur borti :

Their ule in

Phyfick.

Of the Boas.

Due cum lustravit gradiens (mirabile viju)

Non aliter decuffd pluit quam ex arbore nimbus, Which may be Englished thus:

But when no medicine can that plague expell Then ule they Arts, which once the Trojans found, A woman which bad Virgin-laws observed well. Her bare and naked bring they to the ground, Flowing with Natures fbameful filthy bloud : Her bofome open, and her hair untrimmed falling

Vel teretis mali, vel teda cortice glandis. Volvitur ad terram diftorto corpore campe.

Like one ore prest with grief, forgetting good Three times about the plots and bedges walking. Which done, a wonder tie for to be told. As rain drops from the trees, ripe Apples fall Walnuts out of busks : fo cast you may behold Thefe Worms from tiees, all torn, and cannot crall.

Theophrastus saith, that Caterpillers will touch no plants which are moistened on besprinckled with Wine. They will die if they take the fume, or be any way smoaked with the herb Plore. Actiu. Whereby it is apparent (faith Silvius) that the herb commonly termed Scabious is not the true Pfre. Vy nereny it is a provided and feed on Coleworts, if they be but touched with that kinde of Worm which is found in the Fullers Teafel, they die. Pliny. All to besprinkle a Colewort whilest it hath but only three leaves, with Nitre, or with faltish and brinish earth, and by means of the faltnesse, the Cater pillers will be quite driven away. Geopon. Palladim in this case preferreth the ashes of Fig-leves. The Sea-onion called Squilla, being fown or hanged up in Gardens, hindereth the breeding of Caterpillers. Other fome in the most places of their Gardens, and round about them, sow and fet Mints, the pulse called Orobos, which is somewhat like Vetches, and some Wormwood, or at least-wise hang them in bunches in divers places of the same, to expell this kinde of noylone creature.

Some very advisedly take dry leaves and stalks of Garlick, and with the same do smoke and perfume their whole Garden, to that by this way the smoke being conveyed into all places thereof, the Caterpillers will fall down dead, as Palladim hath written, in whose writings any man may read of plenty of fuch Antidotes and Alexipharmical medicines, as may serve to deltroy Caterpillers.

Now will I speak of their use in Physick, and in the Common-wealth. The web of Caterpillers being taken inwardly, stayeth womens fluxes, as Matthiolius faith. Being likewise burnt and put into the noftrils, it stancheth bleeding at the nose. The Caterpillers that are found amongst the herbs called Spurges of all forts, (by the judgement of Hippocrates) are notable for purulent and mattery Wombs, especially if they be first dryed in the Sun, with a double quantity of Earth-worms, and a little Anileed finely powdered, and fo all of them to be relented, and taken in some excellent White-wine. But in case they feel any heavinesse or aking in the belly after the taking of this medicine, then it were good to drink a little Mulfe thereupon. This faith Hippocrates in his Book De

Diojeorides in his first Book and 90. chapter, giveth in drink those common Caterpillers that live in companies together, against the disease called the Squinsie. But unlesse by some hid and seret property, they do good in this grief being received inwardly, it were needful (in regard of their menifelt venomous nature) that they were utterly rejected and contemned. Nicender useth them to

provoke fleep, for thus he writeth :

Ei de suge tripsas oligo en bammati kampen Kepeien drosoeastan epi obloreida noto, &c. Which Hieremias Martin hath thus translated; Quod si redentes olus & frendentia vermes (Lueva quibm virides depingunt terga colores) In medio sacra de Palladio arbore succo Triverie, bineq; tuum colleveris undiq; corpue, Tuta dabie dulci securus membra quieti. Which may be Englished thus; With herbesating, or green-leaf-gnawing Worms, Whose backs imprinted are with colours lively green, All bruifed, mixed with juyce from Pallas tree that runs, Anointed body brought to found fleep is often feen.

There are to be feen in divers thorny, prickly, there and rough herbs, (as for example in Nettle) fundry hairy or lanuginous Caterpillers, which being tyed or hanged about some part of the body, do by and by (as the report goeth) heal those Infants which have any stopping of the meats passage

A Caterpiller breeding in Pot-herbs, being first bruised and then anointed upon any venomous when they cannot swallow. bitings of Serpents, is of great efficacy: and if you rub a naughty or a rotten tooth with the Cole. wort-caterpillers, and that often, within a few days following, the tooth will fall out of his orn accord. Autenna. Caterpillers mixt with Oyl, do drive away Serpents. Diofoorides. If a man arous his hands or any other personich Oyl, the other hands of the his hands, or any other part with Oyl, it will cause that he shall receive no hurt by the stinging of Bees, Walps, or Hornets, as Actius faith. Pliny citeth many fond and superstitious fained matters, and lying tales, devised by those who in his time were called Magi, Soothsayers or Diviners, concerning the admirable versues of Constitute. All this beautiful to the School of the School of the admirable vertues of Caterpillers. All which, because I see them hissed out of the School of Divinity, and that in heart fecretly I have condemned them, I will at this time let them paffe without any further mention.

They are also a very good meat to divers Birds and Fowls, which are so needful for the use, benefit and food of mankinde, as to Starlings, Peacocks, Hens, Thrushes, Daws or Choughes: and to undry fishes likewise, as to the Tench, Pike or Pikerel, and to a certain Sea-fish called a Scorpion: alfo to the Trout, and some others, who are easily deceived with a Caterpillered hook. Which kind of fishing fraud, if you would better be instructed in, I must refer you to Tarentinu in his Geoponicks. and to a little Book dedicated to Robert Dudley, late Earl of Leicester, written by Master Samuel Vicar

of Godmanobefter in Huntingtonfbire.

It is not to be passed over in silence, how that not many years since, there came infinite swarms of Caterpillers out of Thracia into Polonia, Hungaria, and beyond the limits of Germany, which did not only devour the fruits of trees, but whatfoever was green either in the medows and tilled fields. befides the Vines: which was taken for an evident prognostick and fign (as many divined) of some great Turkif Army to come swarming into those parts: neither herein did this their ghesting and militult deceive them, for the next year following was the fiedge of Vienna in Austria, the wasting. fooyling and over-running of Hungeria; and the deadly English-sweating could not contain it self in an Illand, but must spread it self among them of the Continent, whereupon ensued the destrudion of many thousands of people, before any remedy could be found out. In the year of grace 1573, there rushed infinite swarms of Caterpillers into Italy, where they spoyled and made havock of all green buds and graffe growing upon the face of the earth, fo that with their unquenchable and infattate voracity, they left nothing but the bare roots of trees and plants: and this hapned chiefly about Mantua and Briscia. And upon the neck of this, followed a terrible and fearful pestilence, of which there dyed about 50. thousand persons.

Also in the year of our Lord GOD 1570. there were two great and sudden swarms of Caterpillers that came rushing into Italy in the space of one Summer, which put the Romans into an exceeding great fear, for there was nothing left green in all their fields that could be preserved from their ravine, and from their gluttonous and pilling maw. And although the fertility of the year immediately following, did almost blot and rase out the memory of this their heavy punishment, and that many femed as it were to repent them of their repentance; yet are we not to doubt, but that many were truly penitent, and feriously were drawn to amendment of life by a due consideration hereof. God gant that we may be warned by other mens punishments, lest that poor creature, which we imagine

to be the fillieft and least able to do us harm, we finde the most heavy.

of the BOAS.

TT was well known among all the Romans, that when Regular was Governor or General in the Pa-I nick wats, there was a Serpent (neer the River Bagrade) killed with flings and and stones, even as Town or little City is overcome, which Serpent was an hundred and twenty foot in length: whose skin and cheek bones were reserved in a Temple at Rome, until the Numantine war.

And this History is more easie to be believed because of the Boas Serpent bred in Italy at this day : for we read in Solinus, that when Claudius was Emperor, there was one of them flain in the Vatican at Rume, in whose belly was found an Infant swallowed whole, and not a bone thereof broken. The German call this Serpent Uncke, and besides them I do not read of any other Name. Some have ignorantly confounded it with Cherfydrus, an Adder of the earth, but upon what reason I do not know, only Solimu discoursing of Calabria, might give some colour to this opinion, when he saith, Calabria Cheffdiu oft frequentiffema, & boam gignit quem Anguem ad immensam molem ferunt coalescere: that is to say, Cilabia is full of Earth-adders, and it breedeth the Boas, which Snake some affirm will grow into a monftrous flature. Out of which words, there is no wife man can collect, that the Boas and the Adder of the earth are all one thing.

The Latines call it Boa and Bova of Bos, because by sucking Cows milk it so encreaseth, that in the end it destroyeth all manner of herds, Cattel and Regions. And our domestical Snakes and Adders, will also suck milk from Kine, as in all the Nations of the world is most manifest to them that will observe the same.

The Italians do usually call them, Serpeda de Aque, a Serpent of the water, and therefore all the Lamed expound the Greek word Hydre for a Boas. Garden faith, that there are of this kinde in the Kingdom of Senega, both without feet and wings, but most properly they are now found in Italy, according to thefe verfes;

Boa quidem Serpens quem tellus Itala nutrit Huno bubulum plures lac enutrire docent. Which may be Englished thus; The Boas Serpent which Italy doth breed, Men fay, upon the Milk of Gows doth feed.

Their fashion is in seeking for their prey among the heards, to destroy nothing that giveth such blong as it will live, but they referve it alive until the milk be dryed up, then afterward they kill and

672

and eat it, and fo they deal with whole flocks and herds. The poylon of it, faith Feffus, maketh tuand eat it, and io they deal with whole the agree, except Albertus, who in this point agrees mor and swelling in the body, whereunto all other agree, except Albertus, who in this point agrees mor and iwelling in the body; with that they are venomous, and their teethalfo like other not with himself, for in one place he faith, that they are venomous, and their teethalfo like other Dragons, in another place he faith, their poylon is very weak, and not to be regarded, because Dragons, in another place he later, enter poor. They go all upon their belly, and to I will conclude they be Dragons of the third order or division. their flory with Manuan.

Turpi Boa flexilis alvo. . That is to fay: The filthy Boss on his belly moves.

of the CHAM & LEON.

T is very doubtful whether a Chamaleon were ever known to the ancient Hebrews, because there It is very doubtful whether a change appellation thereof, fome affirming one thing, and fome L is no certainty among them for the appropriate forbidden to be eaten of, Koab, or Koab, another. We read Levit. 11. among other beafts there forbidden to be eaten of, Koab, or Koab, which Rabbi Kimhi interpreteth a kinde of Crocodile, (Hazab,) Rabbi Jonas in the Arabian, Hadan which Kabbi Kimbi interpretein a kinde of Cloudies, (taken), An Sanga; the Septuagins and Spain, and fo also doth Avicen. The Chaldee, Koaha; the Persians, An Sanga; the Septuagins and Spain, and Chamæleon. The felf same word is found Levit. 14. which the Jews do vulgarly at this day take a Chamæicon. The left fathe word of the word Oab or Oach, feemeth to come neer to this, which is sometimes interpreted a Tortoyse, a Dragon, or a Monkey. And Oss by Syvaticus, is translated Salamander. Kaaih by the Jews, is translated a Cuckow, a Jay, a Pelican, and an Onoretua: andin Datamanuer. Raum by the Jews, is translated have framed an Hebrew word Gamalion, which is ablurd the fecond of Sephoni for a Chamæleon. Some have framed an Hebrew word Gamalion, which is ablurd. for Gamelon. Zamelon, Aamelon, Hamalcon, and Meleon, are but corrupted terms of Chameleon, as 10r Gametton. Jameson, Aumeton, Ellimation, and the kindes of Lizards or Stellions, as is manifelt lighter well observeth, or else fignifieth some of the kindes of Lizards or Stellions, as is manifelt in Albertus, and other learned Writers. Therefore I will not blot more paper about the Arajim in Auserina, and Jener learned vyriters. Interded, or Albarba, but leave them to the judgement beafts, Harbe and Albarbe, Alarbian or Hardon, Hardun, or Albarba, but leave them to the judgement of those, who delight in the investigation of such fecrets.

Chamæleonis a Greek word, from whence the Latines, and almost all Nations have borrowed the name of this Serpentine or creeping beast, except the Germans, and they only have fained name, as Lindswarm in Albertus, that is, a Worm of the Wood, and Rattader by Gesser, that is, a Ratmook, because in quantity and composition it resembleth both those creatures. Some Latines by reson of the similitude it holdeth with a Lizard, call it Muri Laccritus, a Mouse Lizard. The Greek word Chameleon, fignisieth a low and humble Lion, because in some parts and members, he resembleth that lofty and couragious beaft. So do they derive the name of certain low and flort berbs from great and tall trees, as Chamecopariffus, Chamedris, and Chamepitys, Arubs of Plumtree, Heath, Cypre, Germander, and ground Ivy, from the Cherry, the Cypres, the Cedar, and the Pine tree. And thus much

for the name of the Chameleon. The Countries breeding Chamæleons, are Africa, Afia, and India, and for the quantity thereof I do finde divers descriptions, some particular, as in Bellorius, and Soaliger, and some generalinother Writers, all which I purpose briefly and successively to expresse in this place. Reis faid (find Bd. lonius) that the Frog and the Chameleon are like one to the other, because they use the lane An and industry in taking their meat : and to the intent that this thing may more evidently appear, both by the description and the picture, I have thought good to entreat of the Chamaleon, among the Water-beafts, because it liveth for the most part in moist, marshy, and Fenny places. I have kee of them two kindes, one, a leffer kinde in Arabia, being of a whitish colour, all set over with yellowish or reddish spots, and in quantity not exceeding the green Lizard. The other, in the hot places of Egypt, being twice as big in quantity as the Arabian, and of a changeable colour, become white, green, brown and yellow, for which occasion some have called it versicolor Chamelen, that is, a turn-coat-coloured Chamæleon. But borh these kindes of Chamæleons have a copped head, like to a Camel, and two bones at the top of their brows standing up on either side, and hanging out their eyes are most clear and bright, about the bignesse of a peace, only covered with a skin, to that their appearance outward, exceedeth not the quantity of a Miller-seed. They are very simple, turning upwards and downwards, and are able at one time to look two several ways, distinctly upon two feveral objects, wherein they exceed all other beafts. It is a heavy and dull beat, it the Salamander, neither can it run, but like a Lizard, wherefore it is not afraid of the fight of men neither doth it run from their presence, neither is it easily provoked to harm or bite a man it climbeth little trees for fear of Vipers and horned Serpents.

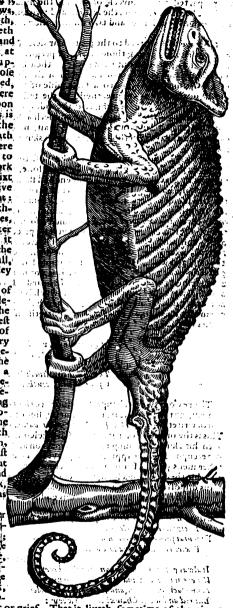

Some have thought that it never eateth meat, but is nourished with the winde, because it drawed in very eagerly many times the winde into the belly, whereby it swelleth; for it hath great light fretched all along the sides of the belly: but this opinion is false, as shall be shewed herester, shough it cannot be showed herester, shough it cannot be showed herester, shough it cannot be showed herester. though it cannot be denyed that it is Oviparum patientissimum famis: that is, The most induring fami among all other Egge-breeding beafts, for it fasteth many times eight moneths: yea, a whole rate together. In flead of nostrils and ears, it hath certain passages in those places, whereby it smalled and heareth.

The opening of the mouth is very large, and is ... About hath teeth on the neather and upper chap like laws. such as are in a Slo-worm, the tongue very smooth. half a hand breadth long, where withal it licketh in those insect Flyes, Horse-flies, Locusts, and Emets whereupon it feedeth : For it keepeth at the mouth a certain fome or moisture, and also upon the tail or backer parts, wherewithal those Flyes and other Creatures are so much delighted, that they follow the Chamaleon, and as it were hewitched with the delire thereof, they fall upon the mosfure to their own perdition; and this is to be noted, that this moisture or fome in the backer parts of the belly is like a Spunge, It bath a line or ftrake under the belly, indented as it were with scales, white in colour, and stretched out to the tail; but the feet feem to be of an artificial work of Nature, wherein is a curious difference betwixt the former and the hinders for the forefeet have three fingers or claws within, and two without: the hinder-feet on the contrary, have two without and three within. It layeth twelve long Egges, fuch as Lyzards do; the heart is not much greater then the heart of a domestical Mouse or Rat , it hath two laps of a Liver, whereof the left is the greater, unto which cleaveth the skin of the gall. the which skin exceedeth not in quantity a Barley corn. And thus far the description by Bellonius.

In the next place for the, better manifestation of the nature of this beaft, I will also adde the de-scription that Scaliger maketh thereof. For he faith, that when Jobannes Landin was in the farthest parts of Syria, he faw five Chamaleons, whereof he bought one, which with his tongue did very suddenly take off a Fly from his breast: Whereforeinthe dissection of the said Chamæleon, he found that the tongue thereof was as long, as a hand breadth, hollow and empty, in the top whereof there was a little hole with filthy matter therein wherewithal he took his prey; which thing feemed new and flrange unto them, which heregofore thought that a Chamaleon lived only by the it. his back was somewhat crooked, rifing with spotted burches like a Saw, like the Turbut fish, his belly sloted with short ribs, his eyes most beautiful, which he turneth every way without bending his neck: his colour white, green, and dusky : naturally green, fornewhat pale on the back, but paler and neerer to white on the belly, yet was it beset all over with red, blew, and white spots.

It is not true that the Chamæleon changeth her felf into all colours, upon green groweth greennelle, upon the dusky is tempered a dusky colour; but upon blew, red, or white, the native greennelle snot blemished or obscured, but the blew, white. and red spore yeeld a more lively and pleasant aspett; upon black, standeth brown, yet so as the green hew seemeth to be consounded with black. andit doth not change his own colour into a fup-

poled colour, but when it is oppressed with sear or grief. That it liveth sometime of the air, a whole year or more, doth appear, because it eateth no meat during that time, but gaping wish a wide mouth draweth in the air, and then thutting his chaps, again his belly swelleth. Yea, I found one that constantly affirmed, that they turn themselves to the beams of the Sun; and gaping wide after them, follow them hard as it were to draw them in. They have five delines claws bon every foot, with two of which they class the round boughs or twigs of trees, as Parrats do when they fit upon their pearches, and thele claws fland not as other Birds do, three together and one by it felf, but in imparity or diffimilitude, three on the que fide, and two on the other, and

fo are parted with an inverse order, for the hinder and former are confirmy one to the other, fo as fo are parted with an inverte order, to the minde on the outfide of the leg before, then are there three if there be three claws on the infide, and two on the outfide of the leg before, then are there three if there be three claws on the infide; And thus much I received from Langius. So far Siz.

Now we will proceed to the particular description of their parts, as we finde them recorded in Now we will proceed to the particular pregnable Narrations of Bellonius and Sealiger. And first of other Writers, leaving those brief and pregnable Narrations of Bellonius and Sealiger. And first of other writers, seaving those of their bodies, then for their colour, and the reasons of their all for the figure and outward shape of their bodies, then for their colour, and the reasons of their all for the neure and outward impe of their figure and shape of their bodies, Pliny is of opinion, mutability and variation of colour. For the figure and shape of their bodies, Pliny is of opinion, mutability and variation of colour. For the figure and fliape of their bodies, Pliny is of opinion, that a Chammeleon is like to a Crocodile of the earth, except in the fharp bending of the backbone, or the length or greatnesse of the tail. Some say that the whole parts of the body doth bene, or the length or greatnesse of the tail. Some say that the whole parts of the body doth sepresent a Lizard, excepting that the fides are joyned to the belty, and the back-bonessia that the fides are joyned to the belty, and the back-bonessia as in Fishes. Arresides faith it resembleth a Stellion is the legs were not straighter and higher as in Fishes. Arresides faith it is a four-footed-brash, much like to a Lizard, yet it goeth higher from the but the truth is, it is a four-footed-brash, much like to a Lizard, and is also a constant. but the truck is, it is a source of the body like a Crocodile, and is allo full of earth, and always gapeth, having a rough skin all over the body like a Crocodile, and is also full of

Ariffetle. Solinus.

The length of it from the tip of the nose to the rump of the tail is feven or eight fingers, the height of them five fingers, and the legs alone, three fingers and a half. The length of the tail eght or nine fingers, the back bone eminent and flanding up, crefted or indemed all throughout to the in or nine tingers, the back main similarit and transmit ap, and lefte visible. On either side at the root of the tail, but tar the rump, the creasure more low and lefte visible. On either side at the root of the ribs fland bony eminent bunches, from which descendeth a line, and is extended throughout the length of the tail on both fides, and if it were not for these bunches the turnings about, and the other three in the lower part, it would be fo exasperated or extenuated toward the end like to the other three in the lower party. The middle place betwint the bottom of the belly and the top of the tail of a Rat or great Moute. The middle place betwint the bottom of the belly and the top of the back, containeth an angle or flexure of fixteen ribs, after the fashion or proportion of a Greek Lambde, except that the angle thereof be more wide and patent, which looketh backward toward the tail, and within these ribs is the whole hanch of the body and belly, contained in a round compaffe on eitheir fide. Being black, it is not unlike the Crocodile, and being pale, it like to the Lizard, fet over with black spots like a Leopard. It changeth colour both in the eyes, tail, and whole body, always into the colour of that which is next it, except red and white, which colour it canot easily undertake, fo that it deceiverh the eyes of the beholders, turning black into green, and green into blew, like a Player, which putteth off one person, to put on another: according to these verles of Ovid:

Id quoque quod ventis animal nutritur & aura, Protinus affimilat, tetigit quofcunq; colores. In Ragtish shus; The Beast that liveth by winds and weather. Of each thing touched taketh colour.

The reasons of this change or colour are the same which are given of the Buffe and Payer fin, namely, extremity of fear, the thinnesse, smoothnesse, and baldnesse of the skin. Whereupon Intullian writeth thus; Hoc foli Chamaleonal dalum quod vulgo dittum est de fue cerio ludere : Thecis to by, This is the only gift of nature to a Chamæleon, that according to the common Proverbit deceret with his skin : meaning that a Chamzeleon at his own pleasure can change the colour of his sin. Whereupon Erafines applyeth the provert de alieno corio ludere, to such as secute themselves min other mens peril. From hence also comest another proverb, Chamallontos rumei abilionan, mot mutable then a Chamzleon, for a crafty, cunning, inconftant fellow, changing himfelf into every mans disposition; such a one was Alcibrates, who was faid to be in Athens, and of such a manteles bling this beaft, did Alcianus make this emblem against flatterers :

Semper biet, femper tennem qua vefeitun gurant, Reciprocat Chamaleon . Et mutat faciem, varios fum tque colques,

Prater rubrum vel candidum.

Sie & adulator populari vescitur aura, Hianfque cunta devorat. Et folum mores imitutur principis aires, Albi & pudici rescius.

It alway gapes, turning imand out that breath Whereon it feeds : and often changeth how : Now black and green, and pale, and other colors bath, But red and white Chamakons de efchew :

That is to fay s Bo Claubacks feed on vulgar breats a had, With open mouth devouring fame and red. Princes black-vices praise, but vertual dead, Defigned in nature by colours red and white.

A Champleon of all Egge-breeding Beafts is the thinnest, because it lacketh bloud, and them. fon hereof is by Ariffote referred to the disposition of the foul : For he saith, through overnat foar, it taketh upon it many colours; and fear through the want of Bloud and heat is a refrigeration

Plinarch allo calleth this Beaft a meticulous and fearful beaft, and in this caufe concludentible of this Beaft. change of his colour, not as fome say, to avoid and deceive the beholders and to work out his own happinesse, but for meer dread and terrour. Johannes Urfinus assigneth the cause of the change of Chammleons colour, not to fear, but to the meat and to the air , as appeareth by thefe verles ;

ad oam.

Non timor, imà clòm, nimirum limpidus der, Ambo fimil vario membra colore novana: Which may be thus Englished; Not fear, but meet which is the air thin, New colours on his body doth begin.

But I for my part do affign the true cause to be in the thinnesse of their skin, and therefore may effly take impression of any colour, like to a thin seak of a horn, which being laid over black. femeth black, and so over other colours : and besides, there being no hinderance of bloud in this Realt, nor Intrails, except the lights, the other humors may have the more predominant mutation. and fo I will conclude the discourse of the parts and colour of a Chamaleon, with the opinion of Kirgnides, not that I approve it, but to let the Reader know all that is written of this Subject, his words are these; Chamalem fingulis boris dies mutat colorem, A Chamaleon changeth his colour every hour of a day.

This Beaft hath the face-like a Lyon, the feet and tail of a Grocodile having a variable color, as you have heard, and one strange continued nerve from the head to the tail, being altogether without felh, except in the head, cheeks, and uppermoft part of the tail, which is joyned to the body; neither hath it any bloud but in the heart, eye, and in a place above the heart, and in certain veins derived from that place, and in them also but a very little bloud.

There be many membranes all over their bodies, and those fronger then in any other Beasts, From Ariffold. the middle of the head backward, there ariseth a three square bone, and the fore part is hollow and Pliny. round like a pipe, certain bony brims, sharp and indented, standing upon either side. Their brain is fo little above their eyes, that it almost toucheth them, and the upper skin being pulled off from. their eyes, there appeareth a certain round thing like a bright ring of Braffe, which Niphus calleth Palle, which fignifieth that part of a Ring, wherein is fet a pretious stone.

The eyes in the hollow within are very great, and much greater then the proportion of the body. round and covered over with fuch a skin as the whole body is, 'except the apple, which is bare, and that part is never covered. This apple stands immoveable, not surned, but when the whole eye is turned at the pleasure of the Beast. The snout is like to the snout of a Hog-ape, always gaping, and Solimus. never shutting his mouth, and serving him for no other use but to bear his tongue and his teeth this gumsare adorned with teeth as we have said before, the upper lip being shorter and more turned in then the other. Their throat and artery are placed as in a Lizard : their lights are exceeding greats and they have nothing elfe within their body. Whereupon Theophrastus as Plutarch witnesseth, conceiveth, that they fill the whole body within, and for this cause it is more apt to live on the air, and

It hath no Spleen or Milt, the tail is very long, at the end and turning up like a Vipers tail, winded Artflotte. together in many circles. The feet are double cloven, and for proportion resemble the thumb and hand of a man, vet fo, as if one of the fingers were fet neer the fide of the thumb, having three without and two within behinde, and three within, and two without before; the palm betwize the fingers is somewhat great: from within the hinder-legs, there seem to grow certain spurs. Their legs are fraight, and longer then a Lizards, yet is their bending alike, and their nails are crooked and very sharp. One of these being diffected and cut afunder, yet breatheth a long time after, they goeinto the caves and holes of the earth like Lizards, wherein they lie all the Winter time, and come forthagain in the Spring, their pace is very flow, and themselves very gentle, never exasperated but when they are about wilde Fig-trees.

They have for their enemies the Serpent, the Crow and the Hawk. When the hungry Serpent doth affault them, they defend themselves in this manner, as Alexander Mindia writeth; they take in their mouths a broad and strong stalk, under protection whereof as under a buckler, they defend themselves against their enemy the Serpent, by reason that the stalk is broader then the Serpent can gipt in his mouth, and the other parts of the Chamæleon fo firm and hard, as the Serpent cannot but them: he laboureth but in vain to get a prey, so long as the stalk is in the Chamæleons mouth. But if the Chamæleon at any time see a Serpent taking the air, and sunning himself under some grentree, he climbeth up into that tree, and setleth himself directly over the Serpent, then out of his mouth he casteth a thread like a Spider, at the end whereof hangeth a drop of poyson as bright as any pearl, by this ftring he letteth down the poylon upon the Serpent, which lighting upon it, kilishit immediately. And Sealiger reporteth a greater wonder then this in the description of the Champicon, for he faith, if the boughs of the tree fo grow as the perpendicular line cannot fall dis redly upon the Serpent, then he fo correcteth and guideth it with his fore-feet, that it falleth upon the Serpent within the mark of a hairs breadth.

The Rayen and the Crow are also at variance with the Chamzleon, and so great is the adverse nature betwint these twain, that if the Crow eat of the Champleon being slain by him, he dyeth for is, except he recovereth his life by a Bay-leaf, even as the Elephant after he hath devoured a Cha-Releon, laveth his life by eating of the Wilde-olive-tree. But the greatest wonder of all is, the boshity which Pliny reporteth to be betwirt the Chammeleon and the Hawk. For he writeth,

Mmm2

that when a Hawk flyeth over a Chamzleon, the hath no power to refill the Chamzleon, but filthat when a Hawk nyeth over a Chamaricon, but falleth down before it, yeelding both her life and limbs to be devoured by it; and thus that devourer leth down before it, yeelding both her life and limbs to be devoured by it; and thus that devourer leth down before it, yeelding both her life and limbs to be devoured by it; and thus that devourer leth down before it, yestung both others, hath no power to fave her own life from this little Beaft.

A Chamzleon is a fraudulent, ravening and gluttonous Beaft, impure, and unclean by the law of A Chamzleon is a traudulent, ravening and property of the law of GOD, and forbidden to be eaten: in his own nature wilde, yet counterfeiting meekneffe, when he is GOD, and torbidgen to be eaten. In the first to have spoken for the description of this Beast, a word in the custody of man. And this shall suffice to have spoken for the description of this Beast, a word in the custody of man.

or two of the Medicines arifing out of it, and so a conclusion. r two or the Medicines arising observed two kindes of Medicines in this Beast, one magical, and I finde that the Ancients have observed two kindes of Medicines in this Beast, one magical, and I made that the Ancients have been although not able to judge of either, yet I have thought the other natural, and for my own part; although not able to judge of either, yet I have thought the other natural, and lot my this History. And first of the natural medicines, Democine is of good to annex a relation of both to this History. And first of the natural medicines, Democine is of good to annex a relation of both to village, and yet he himself telleth mothing of them worthy of opinion that they deserve a peculiar Volume, and yet he himself telleth mothing of them worthy of opinion that they deserve a peculiar volume, and superfittions of the Gracians. With the one page, except the lying vanities of the Gracians. one page, except the lying wants of the body be anointed three days together; and the white. galli it the innumous and reprodus partes of the eyes, it is believed to give a present remedy: and Archigenes prescribeth the same for a nesses of the eyes, it is believed to give a present remedy: nette of the eyes, it is beneves to Bure of the and pricking hairs of the eye-brows. It is thought medicine for the taking away of the unprofitable and pricking hairs of the eye-brows. It is thought measure for the taking away of the unposition that it hath power to cure a quotidian Ague. If the if it be mixed with fome tweet compositions and forgetful person, it is thought to have power tongue of a Chamzeleon be hung over an oblivious and forgetful person, it is thought to have power to restore his memory.

Rhazes.

Marcellus.

Kiranides.

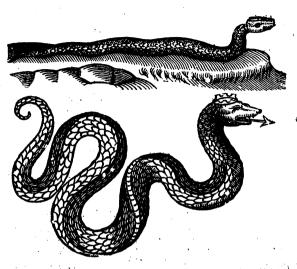

The Chamæleon from the head to the tail, hath but one Nerve, which being taken out and hung about the neck of him that holdeth his head awry, or backward, it enreth him. The other parts about the neck of the time time the parts of the Hyana and the Sea-calf. If a Chamaleon be fod inan have the same operation as the parts of the Hyana and the Sea-calf. earthen pot, and confumed till the water be as thick as Oyl, then after fuch feething take the bones out, and put them in a place where the Sun never cometh, then if you fee a man in the fit of the Fal. ling ficknesse, turn him upon his belly, and anoint his back from the Os facrum to the ridge-bone and it will presently deliver him from the fit: but after seven times using, it will perfectly cure him. The Oyl thus made must be kept in a Box. This medicine following is a prefent remedy against the Gowt. Take the head and feet of a Chamzeleon, cut off also the outward parts of the knees and feet, and then keep by themselves those parts : that is to say, the parts of the right leg by themselves, and the parts of the left leg by themselves, then touch the Nail of the Chamæleon with your thumb and right finger of your hand, dipping the tips of your fingers of the right hand in the bloud of the right foot of the Beaft : and so likewise the fingers of the left hand in the bloud of the left foot, then include those parts in two little pipes, and so let the fick person carry the right parts in the right hand, and the left parts in the left hand, until he be cured : and this must be remembered, that he must couch every morning about the Sun-rising the said Chamæleon, yet living and lapped in a linnen cloth, with those parts that are oppressed with the Gout-

The like superstitious and Magical devises are these that follow, as they are recorded by Plmy and Democritus. The head and throat being fet on fire with wood of Oak, they believe to be good sginft Thunder and Rain, and so also the liver burned on a Tyle. If the right eye be taken out of talive, and applyed to the whitenesse of the eyes in Goats milk, it is thought to cure the same. The tonge bound to a woman with child, preserveth her from danger in childe-birth, if the same tongue be taken from the Beaft alive, it is thought it fore-sheweth the event of judgement. The Hart was ped in black Wooll of the first shearing, by wearing it cureth a quartane Ague; the right claw of the fore-feet bound to the left arm with the skin of his cheeks, is good against robberies and terron of the night, and the right pap against all fears. If the left foot be scorched in a furnace with thebab Chamzleon, and afterward putting a little Ointment to it, and made into little Passies, sobing carryed about in a wooden box, it maketh the party to go invisible. The right shoulder makeh a man to prevail against his adversaries, if they do but tread upon the nerves cast down upon the auth-But the left shoulder they consecrate the same to monstrous dreams, as if that thereby a man might dream what he would in his own person and effect, the like in others.

With the right foot are all Palfies resolved, and with the left foot all Lethargies: the Wine wherein one fide of a Chamæleon hath been fteeped, fprinkled upon the head, curein the achthereof. If Swines Greafe be mingled with the powder of the left foot or thigh, and a mans foot be Liver, with the lights of a Toad; likewise the Liver dissolveth amorous Inchantments. Melantholy men are cured by drinking the juyce of a Chamæleon out of a Chamæleons skin. They slio hy sha the Intrails and dung of this Beaft washed in the urine of an Ape, and hung up at our enemies gate,

With the tail they bring Serpents affeep, and flay the flowing of the flouds and waters: the fine causeth reconciliation. mingled with Cedar and Myrrhe, bound to two rods of Palm, and ftruck upon water, cauled a things that are contained in the same water to appear; but I would to GOD that such Magning were well beaten with Rods of ftronger wood, until they for fook these magical fooleries: And the much for the story of the Chamzleon.

Of the COCKATRICE.

T'His Beift is called by the Grecians, Bafilifors, and the Latines Regulus, because he seemeth to be the King of Serpents , not for his magnitude or greatnesse. For there are many Serpents bigger then he, as there be many four-footed Beasts bigger then the Lyon, but because of his Pling. flately pace, and magnanimous minde; for he creepeth not on the earth like other Serpents, but Solinue. goeth half upright, for which occasion all other Serpents avoid his fight. And it seemeth nature bath ordained him for that purpose: for beside the Brength of his poyson which is uncurable, he hatha certain combe or Coronet upon his head, as shall be shewed indue place. It is also call'd Stbilm, as we read in Isidorus, Sibilus enim occidit antequam mordeat vel enurat : The Cockatrice killeth beforeit burneth. The Hebrews call it Petben, and Curman, alfo Zaphna, and Zaphnaint. The Challe Hamene, and also Carmene: The Ægyptian, Vreme; the Germans, Ein Eriz Schlengle; the French, Un

Befüle; the Spaniards and Italians, Bafilifeo.

There is some question amongst Writers, about the generation of this Serpent: for some (and thosevery many and learned) affirm him to be brought forth of a Cocks Egge. For they say that when a Cock growigh old, he layeth a certain Egge without any shell, in stead whereof it is covered with a very thick skin, which is able to withfland the greatest force of an easie blow or fall. They lay moreover, that this Egge is laid only in the Summer time, about the beginning of Dog-days, being not long as a Hens Egge, but round and orbicular : Sometimes of a dufty, fometimes of a boxy formetimes of a yellowish muddy colour, which Egge is generated of the putrefied feed of the Cock, and afterward fet upon by a Snake or a Toad, bringeth forth the Cockatrice, being half a foot in length, the hinder-part like a Snake, the former part like a Cock, because of a treble combe on his

But the vulgar opinion of Europe is, that the Egge is nourished by a Toad, and not by a Smake? howbeit in better experience it is found that the Cock doth fit on that Egge himfelf : whereof Levi-Im Limits in his twelfth Book of the hidden miracles of nature hath this discourse, in the fourth Chapter thereof. There happened (faith he) within our memory in the City of Prizes, that there were two old Cocks which had laid Egges, and the common people (because of opinion that those Eggs would engender Cockstrices) laboured by all means possible to keep the faid Cocks from steel ting on those Egges, but they could not with clubs and staves drive them from the Egges, until they forced to break the Egges in funder, and strangle the Cocks. But this point is worth inquiwhether a Cock can conceive an Egge, and after a certain time lay the same without a thell. I for my part am perswaded, that when a Cock groweth old, and ceaseth to tread his female in the ordinary course of nature, which is in the seventh or ninth year of his age, or at the most in the fourteenth, there is a certain concretion bred within him by the putrefied heat of his body, through the flaying of his feed generative, which hardeneth unto an Hgge, and is covered with such a shell, as is faid already: the which Egge being nourished by the Cock or some other best. I have a shell, as is faid already: the which Egge being nourished by the Cock or some other best. beift, bringeth forth a venomous Worm, such as are bred in the bodies of ment or as Wasps, there are Horie-flies, and Caterpillers engendered of Horse-dung, or other putrefied humors of the earth Mmm 3

Pliny.

Textor.

Avicenna.

Alianus.

Solinus.

and fo out of this Egge may fuch a venomous Worm proceed, as in proportion of body, and pelis and so out of this Egge may just a ventilities of Basilisk, and yet it is not the same whereof second breath, may resemble the African Cockatrice or Basilisk, and yet it is not the same whereof we purpose here to intreat, bur will acknowledge that to be one kinde of Cockatrice, but we purpose here to intreat, bur will acknowledge that to be one kinde of Cockatrice, but we purpose nere to intreat, but will be the earth, for as the ancient Hermes writeth, it is both this kinde is generated like other Serpents of the earth, for as the ancient Hermes writeth, it is both this kinde is generated like of the Street S falle and impossible, that a constitute mount in the meaneth the Elixir of life, wherewithal the mention of a Bafilisk ingendered in dung, whereby he meaneth the Elixir of life, wherewithal the Alchymitts convert metals.

chymits convert metals.

The Egyptians hold opinion, that these Cockatrices are ingendered of the Egges of the Bird cal-The Agyptian nois opinion, that there seems wherefoever they finde them: and for this cause in led Ibis, and therefore they break those Egges wherefoever they finde them: and for this cause in led 164, and therefore they because they will fignifie a lawful execution after an upright judgment, and found their Hieroglyphicks, when they will fignifie a lawful execution after an upright judgment, and found

institution of their fore-fathers, they are wont to make an Ibis, and a Cockatrice,

The Countries breeding or bringing forth these Cockatrices, are said to be these: First Africk, and therein the ancient seat or land of the Turks, Nubia, and all the Wildernesse of Africa, and therein the ancient lear of famong the Physicians only, doubterly whether there be a Cockatice or no, whose authority in this case must not be followed, seeing is with never given to mortal man or no, whole authority, thing, for besides the holy Soriptures unavoidable authority, which both in the prophesie of E ay and Jeremy, maketh mention of the Cockarrice and her Egges: there be many grave humane Writers, whose authority is irrefragable, affirming not only that there be Cottagrave humane Writers, whose authority is irrefragable, affirming not only that there be Cottagrave humane Writers, whose authority is irrefragable, affirming not only that there be Cottagrave humane Writers, whose authority is irrefragable, affirming not only that there be Cottagrave humane with Maximillan the Emperor, he saw the carket of a Cockatrice, referred in his when he was with Maximillan the Emperor, he saw the carket of a Cockatrice referred in his treasury among his undoubted monuments. Of this Serpent the Poet Georgim Pidorim writeth on

Rex est Serpentum Bafiliscus, quem modo vineunt Mustela insultus, savaque bella fera. Lerneum vermem Bafilifoum fæda Gyrene Producit cuntie maxime perniciem.

Degrepiti, in ffrno, fole nitente, docent. Sed quontam offactu lædit, vifuque ferarum Omne geniu, credas nulla tenere bona. That is to fav :

Bi nafci en quaguli, fi credere fas eff.

The Basilisk the Serpents King I finde, Tet Weafels him do overcome in warre, Abe Cyrenland him breeds of Lernaes kinde, They to all other a destruction are:

And if we may believe, that through the heat of Sun, In old Cocks Egges this beaft is raifed firft , Or beafts by fight or finell thereof are all undone, Then h't not good but of his kinde the woff,

We do read that in Rome, in the days of Pope Lee the fourth, there, was a Cockatrice found in a Vault of a Church or Chappel, dedicated to Saint Luces, whose perfiferous breath had infeded the air round about, whereby great mortality followed in Rome: but how the faid Cockarice une thither it was never known. It is most probable that it was created and fent of GOD for the punts. ment of the City, which I do the more easily believe, because Signitus and Julius Scaller do thim, that the faid pestiferous beast was killed by the prayers of the faid Lee the fourth.

I think they mean that by the authority of the faid Bishop, all the people were moved to general fasting and prayer, and so Almighty GOD who was moved for their fins, to lend fuch a page amongst them, was likewise intreated by their prayers and fuits, not only to reverse the page, but with the same hand to kill the beast, wherewithal it was created; even as once in Agn by the hand of Moses, he brought Grasse-hoppers and Lice, so by the same hand he droye them away and There is forme small difference amongst the Writers, about the quantity and parts of this Se-Pent: which I will briefly reconcile: First Ælianus faith, that a Cockatrice is not patt a fpan incompelle, that is as much as a man can gripe in his hand. Pliny faith, that it is as big as twelve finger, Solings and Ifidores affirm, that it is but half a foot long.

Agisen faith, that the Arabian Harmena, that is, the Cockatrice, is two cubits and a half long No. cander faith. Estabus extense perrettue corpore palmer, that is it is in length but three palms. Lais shin, that it is as big as three handfuls. Now for the reconciliation of all these. It is to be undersood, that Ring and Bliames speaketh of the Worm that cometh out of the Cocks Egge, in regard of the length, but not of the quantity, and fo confound together that Worm and the Coclaire, for it is your reasonable, that seeing the magnitude and greatnesse of the Serpent is concluded to take the least a span in compasse, that therefore the length of it must need be three or for for at the shortest, else how could it be such a terror to other Serpents, or how could the fore-part of take to aming not be about the same and in amisently above the earth, if the head were not lifted at the leaft a foot from the ground. So the we will take it for granted, that this Serpent is as big as a mans wrift, and the length of it amounts

It is likewife qualtionable whether the Cockatrice have wings or no: for by reaton of his cop ceived generation from a Cock, many have described him in the fore-part to have wing; and inthe hinder part to have a tail like a Serpent: And the conceit of wings seemeth to be derived from boly. Seriornire, because it is a written. holy Scripture, because it is written Esay 14. vers. 29. De radice colubri egredien regult of que abforbent voluciemt That is co fay, Out of the Serpents roots shall come a Cockenice, and fruit thereof field be a fiery flying Serpent, as we translate it in English: but Trendlin the belief terpreter, doth render the Hebrew in this manner : De radice Serpentis prodit bentorius of falls by lius prester volant : That is to say, word for word, Out of the root of the Serpent shall come the

Homorrhe, and the fruit thereof a flying Prefier. Now we know, that the Hamorhe and the Profier Himerior, aire different kindes of Serpents from the Cockatrice, and therefore these Interpreters are two others and learned, we will rather follow the holy Scripture in their translation, being the sulgar Latine, which is corrupted in very many places, as it is also Blay the 30. vers. 6. For refin there is again in the vulgar translation the Cockatrice: and for this cause we have not deferibed the Cockatrice with wings, as not finding sufficient authority to warrant the same.

Theeves of the Cockattice are red, or fomewhat inclining to blackneffe, the skin and carkafe of this bealt have been accounted precious, for we do read that the Pergament did buy but certain pieces of a Cockatrice, and gave for it two pound and a half of filver : and because there is an opinion that no Bird, Spider, or venomous beaft, will indure the fight of this Serpent, they did hang up theskin thereof stuffed, in the Temples of Apollo and Diana, in a certain thin net made of gold: and therefore it is faid, that never any Swallow, Spider, or other Serpent durft come within those Temoles: And not only the skin or the fight of the Cockatrice worketh this effect, but also the Solinus. And moreover, if Scaliner. silver be rubbed over with the powder of the Cockatrices flesh, it is likewise said, that it giveth it a tincture like unto gold : and besides these qualities, I remember not any other in the sless or skin

The hilling of the Cockatrice which is his natural voyce, is terrible to other Serpents, and therefore as foon as they hear the same, they prepare themselves to fly away, according to these verses

of Nicandet 3

Illius auditos expectant nulla susurros. Quantumvis magnes sinuent animalia foiras. Dunde vel in paftum, vel opaca devia filve,

When as the greatest winding Serpents bear. (Feeding in Woods or pasture all abroad. Aliboneb inclos'd in many, fpi rei, yet fear : Or in mid-day the shadows near Brooks road,)

Irriguosve locos, media sub luce diei Excandescenti succens s furore feruntur. Sed turpi conver fa fuge dant terga retror funt. Which may be Englished thus . The fearful biffing of this angry beaft,

They run away, as fast as feet can lead them. Flying his ruge unto some other rest, Turning their backs whereby they do escape him.

available to the tareful

We read also that many times in Africa, the Mules fall down dead for thirst, or else lye dead on the ground for some other causes, unto whose Carkase innumerable troops of Serpents gather themselves to feed thereupon: but when the Basilisk windeth the said dead body, he giveth forth his voyce: at the first hearing whereof, all the Serpents hide themselves in the near adjoyning fands, or elfe run into their holes, not daring to come forth again, until the Coackatrice have well dired and fatisfied himself. At which time he giveth another signal by his voyce of his departure: Elianus. then come they forth, but never dare meddle with the remnants of the dead beaft, but go away to feek some other prey. And if it happen that any other pestiserous beast come unto the waters to drink near the place wherein the Cockatrice is lodged, fo foon asir perceiveth the presence thereof, although it be not heard nor feen, yet it departeth back again, without drinking, neglecting his own nutriment, to fave it felf from further danger; whereupon Lucanus faith;

> -Late fibi submovet omne Kulgus,& in vacaa regnat Bafilifous arena. Which may be thus Englished;
> He makes the outgot for from blim to stand, While Cockettice stone raigns on the fand.

So then it being evident that the hiffing of a Cockatrice is terrible to all Serpents, and his breath and poylon mortali to all manner of Beafts: yet hath God in nature not left this vile Serpent withont an enemy; for the Weafil and the Cock are his triumphant Victors; and therefore Pliny faith well: Uniciale monstro quad fape emilium conceptoere reges videre, mustelarum virur exitto eft, aded natura ubil placult effe sine part : That is to say, This monfter which even Kings have defired to see when it Was dead, Wet is deftroyed by the poylon of Weafils, for fo it hath pleafed Nature, that no Beaft fould be without his match.

The people therefore when they take Wealis, after they have found the Caves and lodging places of the Cockstrices, which are easily discerned by the upper face of the earth, which is burned with their hot paylon, they putche Weafil in unto her: at the fight whereof the Cockstrice flytth like a weaking overmatched with too firong an adverfary, but the Weafil followith after and killeth her. Yet this is to be noted, that the Weafil both before the fight and after the fleegiter, armeth fier felf by eating of Rue, or elfe she would be poyloned with the coategious air about the Cockatrice, and before this Weafil, there is no other beaft in the World which is able to stand in Cockatrice, and the Cockatrice faith Leading the Cockatrice faith Leading the Cockatrice. the Cockatrice; faith Lenudur.

Again, eyen at a Lyon is afraid of a Cock, for is the Baltink, for he is not only afraid at his right be almost dead when he hearesh him crow, which thing is notoriously known through the state of the policy and the policy and the policy of the and a death to Cockatrices, yet he himself is afraid of a Kite.

There are certain learned Writers in Saxony, which affirm, that there are many kindes of Strpents There are certain tearned without unlike to a Cockatrice: for they fay it hath a very flarp heid in their Woods; whereof one is not unlike to a Cockatrice: for they fay it hath a very flarp heid. in their Woods; whereof one is not unlike three Palms, of a great thicknesse, his belly spotted and a yellow colour, in length not exceeding three Palms, of a great thicknesse, his belly spotted and a yellow colour, in length not exceeding the back blew, and the tail crooked and turned up 1 but the openadorned with many white prices: the beat sportion of his body may feem to bear. Thefe Serpens ing of his mouth is far wider then the proportion of his not fo great as the proportion of his mouth is far wider then the proportion of his body may feem to bear. Thefe Serpens may well be referred to Gockatrices: for howfoever their poyfon is not fo great as the Bafilish of may well be referred to Connattices. The hot Countries are far more pertiferous then those which Africa, (even as all other Serpents of the hot Countries are far more pertiferous then those which Africa, (eyen as an other serpents of the very fame reason perswadeth me, that there is a difference are bred in the cold Countries:) the very same reason perswadeth me, that there is a difference are pred in the cold Countries, and that those of Sanonia may differ in poyson from those in Africa, and among the Cockatrices, and that those of Sanonia may differ in poyson from those in Africa, and among the Cockatrices: Besides this, there is another reason in Lemniu, which perswatch the yet be true Cockatrices: Beildes tins, there is the Countreymen fet upon them to kill them Reader there are no Cockatrices; because when the Countreymen fet upon them to kill them Reader there are no Cochatines; because what at all by them, neither is their any apparent con. with Clubs, Bills, or Forks, they receive no hurt at all by them, neither is their any apparent con. with Clubs, Buis, or Folks, the folks, that the poyfon in the cold Country is nothing tagion of the air; but this is answered already, that the poyfon in the cold Country is nothing tagion of the air. and therefore in Saxony they need fear the biting, and not the sirs

ection.

Cardan relateth another story of a certain Serpent, which was found in the walls of an old de. Cardan relater landers the head of it (faith he) was as big as an Egge, too big for the body, which cayed moute in average, the least Stellion. There were teeth on either chap, such as are in Vipers. It had two legs, and those very short, but great, and their feet had claws like a Cats: so that at nad two legs, and those very shot; thad a bunch on the top of the head, and yet it wanted when it flood it was like a Cock, for it had a bunch on the top of the head, and yet it wanted when it was the a down, in the top thereof there was a round both feathers and wings: The tail was as long as the body, in the top there was a round bunch as big as the head of an Italian Stellion. It is very likely that this beaft is of the kinde of

Now we are to intreat of the poylon of this Serpent, for it is a hot and venomous poylon, infe. thing the air round about, fo as no other creature can live near him ; for it killeth, not only by his histing and by his fight, (as is said of the Gorgons,) but also by his touching, both immediately and mediately; that is to say; not only when a man toucheth the body it self, but also by touching a Weapon wherewith the body was flain, or any other dead beaft flain by it; and there is acommon fame, that a Horse-man taking a Spear in his hand, which had been thrust through a Cockstnice, did not only draw the poyfon of it into his own body and fo dyed, but also killed his Horsethereby. Lucen writeth;

> Quid prodest misert Basilisous cuspide Mauri Transallus ? velox currit per tela venenum, Invadit manum equumque., >

In English thus: What had the Moore to kill The Cockatrice with Spear, Sith the fwift poyfon bim did fill, And Horfe that did bim bear.

Ponzettus.

The question is in what part of this Serpent the poylon doth lie; some say in the head alone and that therefore the Basilisk is deaf, because the Air which ferveth the Organ of hearing, is reloved by the intensive calidity: but this feemeth not to be true, that the poylon should be in the bad only, because it killeth by the sume of the whole body, and besides when it is dead it killeth by only touching it, and the Man or Beaft fo flain, doth alfo by touching kill another : Some again say, that the poylon is in the breaft, and that therefore it breatheth at the fides, and at many other places of the body, through and betwixt the scales; which is also true, that it doth so breath: for otherwise the burning fume that proceedeth from this poyfonful beaft, would burn up the Intrais thereof, if it came out of the ordinary place; and therefore Almighty GOD hath so ordained, that it should have spiraments and breathing places in every part of the body, to vent away the heat, left that in very short time, by the inclusion thereof, the whole compage and juncture of the body should be utterly dissolved, and separated one part from another.

But to omit inquiry in what part of his body the poylon lyeth, seeing it is most manifest that it is universal, we will leave the feat thereof, and dispute of the instruments and effects.

First of all therefore it killeth his own kinde, by fight, hearing, and touching. By his own kinde, I mean other Serpents, and not other Cockatrices, for they can live one befide another, for if it were true (which I do not believe) that the Arabian Harmene were any other Serpent then a Coche trice, the very fame reason that Ardonnus giveth of the sellowship of these two Serpents together, (because of the similitude of their natures) may very well prove that no divers kinder can live by well together, in fafety without harming one another, as do one and the fame kinde together. And therefore there is more agreement in nature betwist a Cockatrice and a Cockatrice, then a Cockatrice and a Cockatrice, then a cockatrice and a trice and Harmene, and it is more likely that a Cockatrice doth not kill a Cockatrice, then the second Cockatrice doth not kill an Harmene: And again, Cockatrices are engendered by Egger, accorded to the holy Scripture; and therefore one of them killeth not another by touching, hitting, det w ing, because one of them hatcheth another. But it is a question whether the Cockstrict of the the light of himself : some have affirmed so much, but I dare not subscribe thereunto, because reason it is unpossible that any thing should have it felf, that hurteth not another of his own kinde. resion it is supposed for nature GOD have ordained such a thing, I will not strive against them that

And therefore I cannot without laughing, remember the old Wives tales of the Vulgar Cockes rices that have been in England ; for I have oftentimes heard it related confidently, that once our Nation was full of Cockatrices, and that a certain man did destroy them by going up and down in Nation were the countries own shapes were reflected upon their own faces, and so they dyed. But this falle is not worth refuting, for it is more likely that the man should first have dyed by the corruption of the air from the Cockatrices, then the Cockatrices to die by the reflection of his own similitude from the glaffe, except it can be shewed that the poyloned air could not enter into the glaffe wherein the man did breath.

Among all living creatures, there is none that perisheth sooner then doth a man by the poyson of a Cockatrice, for with his fight he killeth him, because the beams of the Cockatrices eves.do cormot the visible spirit of a man, which visible spirit corrupted, all the other spirits coming from the brain and life of the heart, are thereby corrupted, and fo the man dyeth: even as women in their monthly courses do vitiate their looking-glasses; or as a Wolf suddenly meeting a Man, taketh from

him his voyce, or at the least-wife maketh him hoarfe.

To conclude, this poyfon infecteth the air, and the air fo infected killeth all living things, and likewife all green things, fruits, and plants of the earth : it burneth up the graffe whereupon it goeth or creepeth, and the fowls of the air fall down dead when they come near his den or lodging. Sometimes he biteth a Man or a Beaft, and by that wound the bloud turneth into choler, and so the whole body becometh yellow as gold, presently killing all that touch it, or come near it. The symptomes are thus described by Nicander, with whose words I will conclude this History of the Cockatrice. writing as followeth :

Quod ferit bic, multo corpus succenditur igne. A membris refoluta fuis care defluit; & fit Lurida & obscure nigrescit opaca colore. Nulle etiam volucres que foeda cadavera pascum, Sicoccifum bominem tangunt, ut vultur, & omnes : Huis similes alia, pluvia quoque nunotus aura

When be doth ftrike, the body burt is fet on fire, And from the members falleth off the fleft, withall. It retten is, and in the colour black as any mire. Refus dof carrion-feeding-birds both great and fmall Are all men fo deftroy'd. No Vulture or Biter fierce, Or Weather telling-grow, or Defarts wildest beaft,

Corum, nec quacung: fera per devia lusta Degunt è tali capiunt fibi tabula carne. Tum teter vacuas odor binc eschalat in auras, Aique propinquantes penetrant non fegniter artu ; Sin cogente fame veniens approximet ales, Triftia fata refert, certamg; ex aere mortem. Which may be Englished thus :

Which live in dens sustaining greatest famines force, But at their tables do this flesh detest. Then is the air repleat with's loth some smell. Piercing vital parts of them approaching neer, And if a bird it tast to fill bie hunger fell. It dies affured death, none need it fear.

of the CORDIL.

Lthough I finde fome difference about the nature of this living creature, and namely whether A it bea Serpent or a Fish, yet because the greater and better part make it a Serpent, I will also bring it in his due order in this place for a venomous Beaft. Gefner is of opinion, that it is no other but a Lizard of the Water; but this cannot agree with the description of Arifioile and Bellonius, who affirm the Cordil to have Gills like a Fish, and these are not found in any Lizard. The Grecians call this Serpent Kordule, and Kordulos, whereof the Latines derive or rather borrow their Cordulus, and Cudyla. Numenius maketh this a kinde of Salamander which the Apothecaries do in many Countries fallely fell for the Scincus or Crocodile of the earth, and yet it exceedeth the quantity of a Salamander, being much leffe then the Crocodile of the earth, having gills, and wanting fins on the fides, also alongtail, and according to the proportion of the body, like a Squirrels, although nothing fo big, without feabs: the back being bald and fomewhat black, and horrible rough, through some bunches growing thereupon, which being pressed do yeeld a certain humor like milk, which being laid to the Nothrils doth smell like poyson, even as it is in a Salamander. The beak or snout is very blunt or dulls marmed with very sharp teeth. The claws of his fore-legs are divided into four, and on his hinderleginto five: there is also a certain fleshy fin growing all along from the crown of his head, unto his tail upon the back, which when he swimmeth he erecteth, and by it is his body sustained in the water from finking, for his body is moved with crooked winding, even as an Eel or a Lamprey.

Theinward parts of this Serpent are also thus described. The tongue is soft and spungy, like as is the tongue of a Water-frog, wherewith as it were with glew, he draweth to his mouth, both Leecher and Worms of the earth, whereupon it feedeth. At the root of his tongue there is a certain bunch of fich, which as I think supplyeth the place of the lights, for when it breatheth, that part is especially moved and it panteth to and fro, fo that thereby I gather, either it hath the lights in that place, or ellein some other place near the jaws. It wanteth ribs as doth the Salamander, and it hath certain bones in the back, but not like the ordinary back-bone of other such Serpents. The heart is also all pagy, and cleaveth to the right fide, not to the left : the left ear whereof supplyeth the place of the Fericardium,

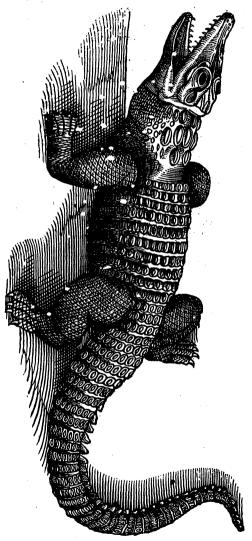

The liver is very black, and somewhat cloven at the bending or sloap side : the milt somewhat red, cleaving to the very bottom of the ventricle. The reins are alfo very foungy, joyned almost to rea, creaving to the very bottom of the fly, but in other places, especially in the belly and breast, it is the legs, in which parts it is most steffly, but in other places, especially in the belly and breast, it is the legs, in which parts it is most steamy in her place of conception, which is forked or double, which are there disposed in order, as in other living griftly creatures. Those Egges are nourished with a are there unposed in order, as in other time come the young ones alive, in as great plenty and number as the Salamanders. And these things are reported by Bellonius, besides whom I finde nothing more faid, that is worthy to be related of this Serpent, and therefore I will here conclude the History

of the CROCODILE.

Because there be many kindes of Crocodiles, it is no marvel although some have taken the word Crocodilus for the Genus, and the feveral Species, they diftinguish into the Crocodile of the earth and the water. Of the earth are sub-divided into the Crocodiles of Brefilia, and the Seincm: the Crocodiles of the water into this here described, which is the vulgar one, and that of Nilw; of all which we shall entreat in order, one fuccessively following another. But I will not contend about the Genus or Species of this word, for my purpose is to open their feveral natures, fo far as I have learned, wherein the works of Almighty God may be known, and will leave the strife of words to them that fpend their wits about tearms and fyllables only. Thus much I finde, that the Ancients had three general tearms for all egge-breeding Serpents. Namely, Rana, Testudo, Lacerta: And therefore I may forbear to entreat of Crocodilus as a Genus, and handle it as a Species, or particular kinde. The Hebrews have many words which they use for a Crocodile. Koah , Levit. 11. which the Arabians render Hardun; and the Persians, Sanga, which word cometh near the Latine word Scinsm for a Crocodile of the earth, and vet that word Keah by Saint Jerom, and the Septuagints is translated a Chamæleon.

In the same place of Leviticus the word Zab is interpreted a kinde of Crocodile wherewithall David Kimbi confoundeth Greschint, and Rabbi Solomon, Faget. The Chaldees translate it Zaba: the Persians, An Rasu; the Septuagints, a Crocodile of the earth; but it is better to follow Saint Hierom in the same, because the Text addeth according to his kinde, wherefore it is superfluous to adde the distinction of the Crocodile of the earth, except it were lawful to eat the Crocodiles of the water.

In Exod. 8. there is a fish called Zephardea, which cometh out of the waters and eateth men, this cannot agree to any fish in Nilus, save only

the Crocodile; and therefore this word is by the Arabians rendered Al Timefeb. Some

by understand Pagulora, Grondeta, und Barrastos, that is greec Proigh. Miles by the most off the sy understand a Horseach, Prov. 30; but Dand Rimbs calleth and there is for a Crossille. Por aith, it is a green Worm, abiding most the Rivers fides, and upon a fudden settlethubon mich of La tel as they passe beside him. Tifma and Alinsa are by Avicen expounded for a Crocodile : and Tenches for that Grocodile that never thoweth his neather of under chap.

Sue link, that in the Province of Affine in Egipi, there is a holy Crowdill worthipped by the Inhabitants, and kept tame by the Priests in a certain Lake, this facred Crocodile is called Suebal, and this word corner to Sendar, which as we have laid, fignifieth any Crocodile of the earth, from which the Arabien Tinje femeth allowo be derived, as the Egyptian Thampfai dotti come neer to the Arabian Tremija. Harodorm callech them Champlai, and this was the old Idniah Worll for a Village Crocodile in hedges. Upon occasion wherever overlight faith, he asked They by while hame they call a Grotodile at this day in Tarky; and he answered Kimpfat, which'is most evidently Porrupted from

The Expriant vulgarly call the Crocodile of Milm, Chemris , the Gretishis, 2011 by okadellor. The Reprime vilgarity continues Dendrites. The Latiner, Creckline; and Albertus, Creckline, and indicatines Dendrites. The Latiner, Creckline; and Albertus, Creckline, and the fame word is remined in all languages of Buspe. About the Etymology of this word. I find two opinions not unprofiteable to be remarked in the first, that Creckline council of Crecks, Saffron and Companions are all dispositions this Companions are the continued to the first that Creckline council of Crecks, Saffron the council of the counc because this Beath, especialty the Crocodile of the careth, is affaid of Saffron, and therefore it Country people, to defend their Thives of Bets and Honey from them, Arow upon the places SAFfrom But this is too far fetched, to name a Braft from that which it feareth, and being a secret in nature, it is not likely there is was discovered at the fielt, and therefore the name must have some other investigation.

Indones faith, that the name Gos dillas comerli of Crocens color, the colour of Santon, because fuch is the colour of the Grocodile, and this feedfeth to be more reasonable. Por I have feed a Grocodile in Intercolour of the october of Egypt dead, and killed with a Musker, the colour whereof was like to parfron growing upon halks in fields. Yet it is there likely, that the derivation of Parmus and England for growing upon a same for they fay that the fliores of fands on the Rivers, were called Groce and Green cale : and because the Crocodites houne and five in those shores, it might give the name to the Beatte. bequife the water Crocodiles live and delight in those fands, but the land or earth Crocodiles abnor.

his reported that the famous Grammarian Arrentiforus feeling a Crocodife lying upon the lands, Aurellanus. he was fo much touched and moved therewith; that he fell into an opinion that his left leg and hand were eaten off by that Serpene, and that thereby he loft the remembrance of all file great learning. and knowledge of Aces. And thus much for the name of this Serpent.

In the next place we are to comfider the Countries wherein Crocodiles are bred, and keep they Ariffele. In the next place we are so confider the Countries wherein Crocodiles are bred, and keep their Arifolle. habitation, and those are especially Egypt, for that only hath Crocodiles of both sinds, that is, 19th Mela. the water and of the land, for the Crocodiles of News are Amphibit, and live in both elements; then Diod. Sicul. the not only in the River News, but also in all the pools near adjourning. The River principles are 1000, New in Asies, doth also bring forest Crocodiles and Pliny saith, that in Dara a River of Maris anisate that, he met with many Sea-horses and Crocodiles, such as we found in the River Willes, and beligher, these countries I do not remember and Crocodiles are ingestibered Crocodiles of the water, which are the greatest and most fauthorist Countries is the resident and most fauthorist Countries in the greatest and most fauthorist Countries is the greatest and most fauthorist Countries in the greatest and most fauthorist Countries is the present the greatest and most fauthorist Countries in the greatest and most fauthorist Countries of the greatest and most fauthorist countries in the greatest and most fauthorist countries are the greatest and most fauthorist countries and the ingestions are the greatest and most fauthorist countries and the countries are the greatest and most fauthorist countries are the greatest and greatest a are the greatest and most fattious Crocodiles of all other.

The Crocodiles of the earth, which are of Perfer note and quantity, are more pentity, for they are found in Lytis, and in Bytoinia, where they are called Azastra, and in the Mountain System in therefore I will not accommonly as is well observed by Ariana, Disjoinia, and Hermany, and therefore I will not accommonly as well observed by Ariana, Disjoinia, and Hermany, and therefore I will not profecute this matter any fulcher.

The kindes being already declared, it follows that we frould protect to their quantity and leger Marcellinus. The kindes being already declared, it follows that we frould protect to their quantity and leger Marcellinus. only appeared that the water Crocodile is much greater, and more polity than the grant less of the earth; for they are not above two cubits forig, or formetimes eight, at the most planes, but the other are flatten, and fotherines more. And befides, there Crocodiles is they are letter, and like the Crocodiles of the earth seduneship) then their voting ones are much greater, but it on they are letter, and like the Crocodiles of the earth of the earth of the country of the c

Takin, in the top of whose shows there gloweth a bunch ske a short.

Now a Crococile is like a Lizard in all points, (excepting the tail, and the quantity of a Lizard) with liveth an Egge no greater them a Glower Bege had from to strain a beginning attent in suppositions are not supposed that we seem; growing all his life tong, unto the length of fifteen of twenty cibits. And as playing the winterfett in the days of Fluminichar King of Repr., effected to do to the first and syengy, countries and before them, in the days of Ample, one that was above six and evently cipits in the tenter was the colour of a Crotodile with the to Safford, that the colour of a Crotodile with the to Safford, that the colour of a Crotodile with the to Safford, that the colour of a Crotodile with the to the blacker knight of Chammison, in the form Many saich, that their belly is somewhat winter then the other parts. Their body is somewhat work, being covered with a certain bank or rinde, so thick, firm, and strong as a sufficient year.

Hover, being covered with a certain bark of rinde, fo thick, firm, and strong as it will not (and especially about the Back) unto a cart-wheele when the cart is loaded, and in all the upper

parts, and the tail, it is impenertable with any dart on ipear, yea fearfely to a pitel or final gun, but the belly is forget, whereon he receiveth wounds with more facility. for as we shall shew a sterwards, the belly is forget, whereon he receive he wounding them on:

The History of Serpents.

the belly parts their back is diffinguished into divers divided shells, standing up far above the and towards the fides they are lefte eminent, but on the belly they are more impoth, white, and towards the fides they are lefte eminent, but on the belly they are more impoth, white, and towards the fides they are lefte eminent. The eyes of a Grocodile of the water, are reported to be like unto a Swines, and were they are flowness. and very penerianie. Inceyes of a crocount underwater, are reported to be like unto a Swine, and therefore in the water they lee yeek, which by parts of the water they are tharp and quick fighted, like to all other four-looked ectronies that lay egges. They have but one eyedid, and that growell from the neather part of the best, which by reason of their eyes never twinckleth. And the fight in 184, that only the Crocodile smoon all the living creatures in the water, draweth a certain this bright skin from his fore-head over, his eyes, wherewithall he govereth his fight; and this I take to be the only caute of his dim light in the water.

Herodotus. Pliny. Solinus. Marcellinus.

Cælius Rho.

The head of shis Beaft is very proad, and his mout like a Swine ... When he eateth or biteth he never moveth his neather or under thap. Whereof Arthole giveth this reason, that seeing Nature bath given this feet, as that they 349 not able to hold or to take the prey; therefore the mouth is given thim to thort feet, as that they are not able to hold or to take their ey, therefore the mouth is it willed in flead of feet, to as it may more whemently firshe and wound and also more speedily move and turn after the press, and this is better done by the upper, then the neither chap. But it is likely affected for he speaketh of Groedilm maximu, a Crocodile of the Sea: whereas thereis no chief he was deefined for he speaketh of Groedilm maximu, a Crocodile in the Sea; and such peradventilled of the Sea, but rather igns other monster like a Crocodile in the Sea, and such peradventilled albertin saw, and thereupon inconsiderately affirmed, that all Socoodies move their underthans, except the Teacher. But the learned Vessalium proveth it to otherwise, because that the neather-chap is so conjoyined and fastened to the bones of the temples, that it is not possible for to be moved. And therefore the Crocodile only among all other living creatures, moveth the upper-chap, and holdeth the under-chap unmoveable, . The fecond wonder unto this, is that the Crocodile bath no tongue, nor fo much as any appear.

Albertus. Herodotus.

P. Martyr.

Æl anus.

ance of a tongue. But then the question is, how it cometh to distinguish the sapours and tall of his meat. Whereunto Ariffotle aniwegeth that this Grocodile is such a revening Bealt, that his meat tarryeth not in his mouth, but is garryed into his fromach, like as other water Beafts, and therefore they differn sapours, and relish their meat more speedily then other; for the water or humor salleth fo fait into their mouths, that they cannot fland long upon the raft or diffait of their meat, But yerforne make queftion of this, and fligy answer that most men are deceived herein, for whilesther look for his tongue upon his neather, than, as it is in all other Beafts, and finde none, they conclude Milit to want that part : but they thould confider, that the tongue cleaveth to the moveable part, and as in other Beafts, the neather-chap is the feat of the tongue, because of the motion, so in this the tongue cleaveth to the upper-shap, because that it is moveable, and yet not visible as in other, and difference is yet; hardly differenced. For all this, I rather conclude with the former Authors, that feeing it liveth both in the waters and on the land, and therefore it refemblesh a fish and a back, as'it tefembleth a Beaft, locum obtinet lingue, it hath a place for a tongue; but as it resemblethafifh, Elibury of, it is without a tongue. It hath great teeth standing out, all of them stand out before visibly when the mouth is shut and fewer behinds, And whereas Aristotle writeth, that there is no label creature which hath both denies prominents, of ferratos, that is, standing out, and divided IRE Waw, yet the Crocodile hath both. The entech are white, long, sharp, and a little crooked and hollow, their quantity well resembling the residue of the proportion of the body: and some say there a Crocodile hath three rows of teeth, like the Lyon of Chims, and like the Whale, but tay: that a Crocodie, hath three rows of teeth, like the Lyon of Chins, and like the Whale, but this is Wot an approved opinion, because they have no more then fixty teeth. They have allo fixty joyins or bones in the back, which are also tyed together, with so, many nerves. The opening of his mouth reacheth, to the place of his ears, and thereighe some Crocodiles in Ganger which have a kinde mouth reacheth to the place of his ears, and thereighe some Crocodiles in Ganger which have a kinde mouth reacheth to the place of his ears, and thereigher some says only in them the bring forth egges, their stones are inward and cleave to their loyns. The tail is of the same his lights that the whole body hard, and the same is also rough and armed with, hard skin upon the lights of the feet are like a seas, but beneath it is smooth and tender. It hath fins upon the tail, the the beneath whereof it swimmers have also be the feet. The feet are like a seas, cr-Hy the benefit whereof it swimmerh, as also by the help of the feet. The feet are like a Bear, crebe that they are covered with scales in stead of hair; their nails are very sharp and from for it had a rhimb as well as it hath feet, the strength thereof would over turn a ship. It is doubtful when the strength thereof would over turn a ship. It is doubtful when the strength thereof would over turn a ship. It is doubtful when the strength thereof would over turn a ship. ther it thath any place of excrement except the mouth in And thus much for the feveral parts of the

The knowledge alloof the natural actions and inclinations of Crocodiles is requilite to be hand The knowledge also of the natural actions and inclinations of Crocodiles is requisite to be hard led in the next place, because that actions follow the members as sounds do infruments. First therefore, although driftent for the most part speaking of a Crocodile, calleth it aqually of switters and Rivers, as though it never came out of them like siffices, but only to note that particular kinde which different from them of the eagth, sort is creating that it liveth in both elements, namely earth and water; and for the time that is abdetin the water, it also taketh air, and not the humor or moistnesses of the water, yet can they not want either the more of the water or respiration of the air. and for the day time it abideth on the land. either humor of the water or respiration of the air; and for the day time it abideth on the land, id in the night in the water, because in the day, the earth is hotter then the water, and in the night the dater warmer then the earth and while it hyethon the land, it is fo delighted with the

shine, and lyeth therein so immoveable, that a man would take it to be stark dead. The eyes of a Crosodile (as we have faid) are dull and blinde in the water, yet they appear bright to others, for this cause, when the Egyptians will fignifie the Sun-rifing, they picture a Crocodile looking upward to the earth, and when they will fignifie the West, they picture a Crocodile diving in the water, and to for the most part the Crocodile lyeth upon the banks, that he may either dive into the water, and

By reason of the shortnesse of his feet, his pace is very slow, and therefore it is not only easie to escape from him by flight, but also if a man do but turn aside and winde out of the direct way, his body is so unable to bend it self, that he can neither winde nor turn after it. When they go under the earth into their caves, like to all fore-footed and egge-breeding Serpents, as namely Lizards, Stellions, and Tortoifes, they have all their legs joyned to their fides, which are fo retorted as they may bend to either fide; for the necessity of covering their egges; but when they are abroad, and go bearing up all their bodies, then they bend only outward, making their thighs more visible. It is tomewhat questionable, whether they lye hid within their caves four months or fixty days, for some Authors affirm one thing, and some another, but the reason of the difference is taken from the condition of the cold weather, for which cause they lye hid in the Winter time. Now foraimuch as the Winter in Egypt is not usually above four months, therefore it is taken that they lie but four months, but if it be by accident of cold weather prolonged longer, then for the same cause the Crocodile is longer time in the earth. During the time they lie hid, they eat nothing, but fleep (as it is thought) immoveably, and when they come out again, they do not cast their skins as

The tail of a Crocodile is his strongest part, and they never kill any beast or man, but first of all they strike him down and astonish him with their tails, and for this cause, the Egyptians by a Crocodiles tail do fignifie death and darknesse. They devour both men and beasts if they finde them in Orms. their way, or neer the bankes of Nilus, wherein they abide, taking sometimes a calf from the Cow his Dam, and carrying it whole into the waters. And it appeareth by the pourtraiture of Neacles, that a Crocodile drew in an Asse into Nilm as he was drinking, and therefore the Dogs of Egypt by a kinde of natural inftinct, do not drink but as they run, for fear of the Crocodiles: whereupon came the proverb, Vi Canis è Nilo bibit & fugit, as a Dog at one time drinketh and runneth

When they defire fishes, they put their heads out of the water as it were to sleep, and then suddealy when they espy a booty, they leap into the waters upon them and take them. After that they have eaten and are fatisfied, then they turn to the land again; and as they lie gaping upon the earth, the little bird Trochilus maketh clean their teeth, and is satisfied by the remainders of the flesh stickingupon them. It is also affirmed by Arnoldus, that it is fed with mud, but the holy Crocodile in the Strabo. Provinte of Arfinos, is fed with bread, flesh, wine sweet and hard, sod flesh and cakes, and such like things as the poor people bring unto it when they come to fee it. When the Egyptians will write a Orus.

man eating or at dinner, they paint a Crocodile gaping. They are exceeding fruitful and prolifical, and therefore also in Hieroglyphicks they are made to fignific fruitfulnesse. They bring forth every year, and lay their egges in the earth or dry land. For during the space of theescore days they lay every day an Egge, and in the like space they are hatched into young ones, by fitting or lying upon them by course, the male one while, and the female another. The time of their hatching is in a moderate and temperate time, otherwise they Elianus. perish and come to nothing, for extremity of heat spoyleth the egge, as the buds of some trees Solinus. are burned and scorched off by the like occasion. The egge is not much greater then the egge of a Goose, and the young one out of the shell is of the same proportion. And, so from such a small beginning doth this huge and monstrous Serpent grow to his great stature, the reason whereof, (faith Arifoile) is, because it groweth all his life long even to the length of ten or moe cubits. When it hath laid the egges, it carryeth them to the place where it shall be hatched, for by a natural providence and forelight; it avoideth the waters of Nilus, and therefore ever layeth her egges beyond the compasse of her floods : by observation whereof, the people of Egypt know every year the inundation of Nilus before it happen. And in the measure of this place it is apparent, that this Beatt Plutarch. is not indued only with a spirit of reason, but also with a satisfical or prophetical geographical delineation, for to the placeth her egges in the brim or bank of the flood (before the flood cometh) that the water may cover the nest, but not her felf that fitteth upon the egges. And the like to this is the building of the Beaver, as we have showed in due place before in the History of four-footed

So loon as the young ones are hatched, they inflantly fall into the depth of the water, but if they meet with Frog, Snail, or any other such thing sie for their meat, they do presently tear it in pieces, the dam biteth it with her mouth, as it were punishing the pulillanimity thereof, but if it hun greater things, and be greedy, ravening, industrious and bloudy, that the maketh much of, and. killing the other, nourisheth and tendereth this above measure : after the example of the wifelt men, who love their children in judgement, fore-feeing their industrious inclination, and not in affection, without regard of worth, vertue, or merit. It is faid by Philis, that after the egge is laid by the Croodile, many times there is a cruel stinging Scorpion which cometh out thereof, and wounderh the Crocodile that laid it. To conclude, they never prosper but neer the waters, and they live threescore So laus. years, or the age of a mans life.

Herodotus. Pliny.

The

P. Mariyr.

The nature of this bealt is to be fearful, ravening, malitious, and treacherous in getting of his The nature of this pear is to be resting, in the fine of his bloud, and by other prey, the subtilty of whose spirit, is by some attributed to the thinnesse of his bloud, and by other prey, the subtilty of whose spirit, is by some activities with her young ones, we have shewed already to the hardnesse of his skin and hide. How it dealers with her young ones, we have shewed already, to the hardnette of his skin and high, radwit degenerate or no, and the like things are reported of a it were trying their nature whether they will degenerate or no, and the like things are reported of the Alps. Cancers, and Tortoyles of Egipt.

From hence came the conceit of Pietas Crocodili, the piety of the Crocodile. But as we have faid From hence came the concert of retain Clouded, especially from the frained voyce of a man, it is a fearful Serpent, abhorring all manner of noise, especially from the frained voyce of a man, it is a tearing perpent, approximate an angular transfer of the series o and where ne ringert pimien vanung anaunen, at ubi audacem senserit timidifimum : An audacious Mon-

fer to them that run away, but most fearful where he findeth resistance. to them that run away, But the Crocodile runneth away from a man if he wink with his left eye, and one have written, that the Crocodile runneth away from a man if he wink with his left eye, and Some have written, that the stock of the structure it is not to be attributed to the vertue look stediately upon nim with his rights symbol fight, which is conspicuous to the Serpent from one of the right eye, but only to the reseaself of fight, which is conspicuous to the Serpent from one of the right eye. But only to the reseaself of fight, which is conspicuous to the Serpent from one of the right eye. The greatest terrour unto Gronodies, as both Series and Pliny affirm, are the Inhabitants eye. eye. Ine greaten trition unto orxinate people make them run away with their voyces, and of the Isle Temprus within Nilse; for those people make them run away with their voyces, and or the the senting within the same to share. Of these people speaketh Solinas in this manner; many times purious and take spirit and the Ide Tentyrus within the waters of Nilm, which are of a most There is a generation of men in the fame place. And although their persons or adverse nature to the Crocodile, dwelling also in the same place. And although their persons or adverte nature to the tropoune, www.ining.com. adverte nature to the fudden fight of a presence be of small stature, yet herein is their courage admired, because at the sudden fight of a Presence De or iman manne, yet indignited and of their dare meet and provoke him to run away. They will also leap into the Rivers and swimaster the Crocodile, and meeting with it without liney will and leap into the Alvers and riding on him as upon a Horle. And if the beaff lift up his fear cast themselves upon the beafts back, riding on him as upon a Horle. And if the beaff lift up his head to bite him, when he gapeth they put into his mouth a wedge, holding it hard at both ends with both their hands, and fo as it were with a bridle, lead, or rather drive them captive to the land, where with their noise they to terrifie them, that they make them cast up the bodies which they had fwallowed into their helligs: and because of this antipathy in nature, the Crocodiles dare not come

The like thing we have before in our general discourse of Serpents, shewed to be in the Indian Pfil. li against the greates Serpents. And grabo also hath recorded, that at what time Crocodiles were brought to Rome, these Tentyrites followed and drove them. For whom there was a certain great pool or fish-pond affigned or walled about, except one passage for the beast to come out of the water into the Sun-fhine ; and when the prople came to fee them, thefe Tensyrites with note would draw them to the land, and put them back again into the water at their own pleasure. For they so hook them by their eyes, and bottom of their belies, which are their tenderest parts, that likes Horse broken by their Riders, they yeeld unto them, and forget their strength in the presence of these

Peter Martyr in his third Book of his Babylonian Legation, faith, that from the City Can to the Sea, the Crocodiles are not to hurtful and violent as they are up the River Nilm into the land, and against the fiream. For as you go further up the River, neer the mountain and hilly places; fo shall you finde them more fierce, bloudy and unresissible, whereof the Inhabitants gave him many realons. First, because that part of the River which is betwist the City Cair and the Sea, is very full of all ore of fitnes, whereby the bealts are to filled with devouring of them, that they lift not come out of the water on the land to hunt after men or cattel, and therefore they are the leffe hurnful, for even the Lyon and Wolf do cease to kill and devour when their bellies are full. But sometimes the Crocodies beneath the River, follow the gales or troups of fish up the River. like somany fisher-men, and then the Countrey Figher-men inclose them in necessard to deftery shem. For there is a very great reward proposed by the law of the Countrey, to him that killeth a Crocodile of any great quantity ty, and therefore they grow nor great, and by reason of their smalnesse are less advantious. For so so so so a great Crocodile is discovered, there is such watch and care taken to interrupt and kill him for hope of the reward, that he cannot long elcape alive.

Thirdly, the Crocodiles up the River, towards the Mountains, are more hurtful, because they are prefied with more hunger and famine, and more feldom come within the terror of med wherefore they forfake the waters, and run up and down to feek preys to fatisfie their hunger, which when they meet withall, they devour with an unrefiftible defire, forced and prefied forward by bunger, which breaketh ftone walls. But most commonly when the River Nilse is lowest, and suck down into the channel, then the Crocodiles in the water do grow, most hungry because the fish are gone away with the floods; and then the fubtile beaft will heal and cover himself over with sand or mid, and so le the noods; and then the jubile bealt will heal and cover himself over with sand or mud, and to ut he bank of the River, where he knoweth the women come to fatch water, or the sattle to drink, and when he especial his advantage, he juddenly taketh the woman, by the hand that he sakeh by water withall, and draweth her into the River, where he teareth her in pieces and sateth her. It water withall, and draweth her into the River, where he teareth her in pieces and sateth her. It like fort dealeth he with Oxen, Cows, Asse, and other, cattel. If hunger force him to the land, and he meet with a Camel. Horse, Asse, or such like beast, then with the force and blows, of his tail he breaketh his legs, and to laying him dat on the earth, killeth and eateth him: for so great is the strength of a Crocodites tail, that heep seen that one stroke thereof hath broken all the som firength of a Crocodiles tail, that is hath been feet that one fireke thereof hath brokenall the low

There is also another peril by Crocodiles, for it is said that when Nilus falleth, and the water legs of a beast at one blow. waxeth low, the Barks through want of winde, are fain by the Mariners to be tugged up the

the fiream with long lines and cords t the fubtile Crocodile feeing the fame; doth fuddenly with his tail smite the same line with such force, that either he breaketh it, or by his forcible violence tumbleth the Mariner down into the water, whom he is ready to receive with open mouth before he can recover. Yea many times by means thereof the Bark it felf fo tottereth and recleth, that the violent beaft taketh a man out of it, or else clean over-turneth it, to the destruction of all that

Elianus faith, that among the Ombits which are in Arsinoe, the Crocodiles are harmlesse, and having several names when they are called, do put their heads out of the water and take meat gently, which meat is the head and garbage of such facrifices as are brought thither. But in another olace he writeth, that among the Ombite or Coptite, it is not fafe for a man to fetch water from the River, or to wash their feet, or walk on the Rivers side, but with great caution and waginesse. For River, or to want their teet, or wand on the Arvers mee, but with great caution and warmene. For even those beafts which are most kindely used by men; do rage against their Benefactors, as namely the Crocodile, the Ichneumon, the Wilde-cats, and such like. And yet Platarch in his Book Vira ani- Marcellinus. mallum, faith, that the Priefts, by the custom of meat-giving, have made some of them so tame. that they will fuffer their mouths and teeth to be cleanfed by men. And it is further faid, that during the feven Ceremonial days of the nativity of Apis, there is none of them that sheweth any wilde trick or cruel part, but as it were by compact betwixt them and the Priefts, they lay afide all cruelty and rage during that time.

And therefore Cicero writeth malt excellently, laying; Egyptiorum morem quis ignoret? quorum imbulementes pravitatum erroribus, quamvis carnificinam potius subierint, quam ibim, aut affidem; aut Crocodi. los violent. That is to fay, Who is ignorant of the cultom of the Egyptians? whose mindes are so seafored and indued with erroneous wickednesse, that they had rather undergo any torment, then offer violence to an Bir, an Asp, or a holy Crocodile. For in divers places, all these, and Cats also, were worshipped by the people, according to the saying of Juvenal:

Crecodilon aderat pars hac Ægypti, - Illa pavet faturam Serpentibus Ibim. Which may be Englished thus; This part of Egypt Crocodiles adore. That, the Ibis, fed with Serpents flore.

But the reason of divine worship or honour given to the Crocodiles are worth the noting, that the diligent Reader may the better have some taste of that ancient blindenesse whereby our fore-fathers were mifted and seduced, to for sake the most glorious and ever-blessed principles of Divinity, for arguments of no weight.

Fiftherefore the Idolatrous Priests thought there was some divine power in the Crocodile, because it wanted a tongue, for the Deity or Divine speech hath no need of a voyce to expresse his meaning, according to the faying of the Grecians, Kai di apsophon bainson keleuthin kal dikes, ta thueta agikata diken : For by a mute and filent way it ascendeth; and bringeth all things mortal to a vocal julice, which speaketh in action though not in in voyce even as all that is in the Crocodile, is action

Secondly, by reason of a certain thin smooth skin coming from the midst of his fore-head, Callus. wherewithall it covereth his eyes, fo that when it is thought to be blinde, yet it feeth : even fo is it with the Divine power, for even then when it is not feen , yet doth it fee perfectly all mortal

Again, by their egges and nests they usually fore-shew the over-flowing of Nilus, to the infinite benefit of their Countrey wherein they live, for thereby the husband-men know when to till their land, and when not, when to fow and plant, and lead forth their flocks, and when not : which benefit is also ascribed to Divinity, and therefore the Crocodile is honoured with divine power. Again, it layeth threescore egges, and liveth threescore years, which number of threescore, was

in ancient time the first dimension of heaven and heavenly things.

Gitte also speaking against this Egyptian vanity, faith, that they never confectated a beast for a God, but for some apparent, utility, as the Ibit for devouring of Serpents, and the Crocodile for being a terror to theeves : and therefore the Atabian and Lybian theeves durft nor come over the River Rilus to rob the Egyptians for fear of the Crocodiles.

There is a tale in Diodorus Siculus of the original of a Crocodiles divine worthip, which although it cannot be but fabulous, yet I have thought good to infert it in this place, to thew the vanity of fuperfition and Idolatry. There was a King of Egypt called Minas, or as Herodotta calleth him Mener, who following his Hounds in hunting into a certain marish of Maris, fell in with his Horse, and there fluckfaft, none of his followers daring to come after him to release him, so that he had there perished, had not a Crocodile come and taken him up upon his back, and fet him fafe upon the dry fand. Por which miracle, the faid King built there a City, and caufed a Crocodile to be worshipped, which was called Sychus by all the Inhabitants of that City, and also gave all the faid Marish of Meris, for the fail of the fustenance of the same. It was nourished with bread; flesh, and Wine, Cakes, fod flesh, and weet new Wine: fo that when any man came to the Lake wherein it was kept, the Priests would prefently call the beaft out of the water, and being come to the land, one of them opened his mouth, and the other put in meat, delicacies, and Wine.

This Crocodile of Maria, is the same that is called Arsinoe, and like to that at Thebes, about which they did hang jewels of gold, filver, and jems of ear-rings, bracelets, and such other things of price. When it dyed, they did feafon the body thereof with falt, and buryed it in the holy Tombes or bury. ing Pots. The same also are called Ombite, I mean the people of that Egypt which dwell in diffune. and for the love of the Crocodiles, they abandon all manner of Hawks their enemies, infomuch that many times they take them and hang them up in publique upon gallows for that purpose erected. And further, they keep certain days of triumphs like the Olympiades, and games of honour ; and fo far they were blinded with that superfition, that they thought themselves exceedingly blessed if they lost their children by them, and thought themselves much bonoured, if they law them with their eyes fetched out of the Arcots and playing places by Cro-

Again, all the Egyptient hold opinion, that the Crocodile is a Divinator, which they prove by the testimony of Proloment, who calling one of the facred Crocodiles, which was the older and ber of all, he would not answer him, and afterward offering him meat, he also refuled it, whereat many wondered ; and fome of the Prices faid, in was fome prognostical fign eicher of the Kings death or his own, and fo it fell out shorely after, for the same Crocodile dyed. As though a Swine might not as well be accounted divine, feeing it also refuseth all meat and provocation at the time of their fick-

nesse, and before death.

There is a City in Egypt called Apollinopolis, the City of Apollo, where the Inhabitants abhor and condemn the worthip of Crocodiles, for when they take any of them they hang them up and beat them to death, notwithstanding their tears and cryings, and afterwards they eat them : but the ressonof their hatred is, because Typhon their ancient enemy, was clothed with a Grocodiles shape. Others allo say, the reason of their hatred is, because a Crocodile took away and devoured the daughter of plan-

nites , and therefore they enjoyned all their posterity to hate Crocodiles.

To conclude this discourse of Crocodiles inclination, even the Egyptians themselves account a Crocodile a savage and cruel murthering Beast, as may appear by their Hieroglyphicks, for when they will decipher a mad man, they picture a Crocodile, who being put from his defired prey by forcible resistance, he presently rageth against himself. And they are often taught by lamentable experience, what fraud and malice to mankinde liveth in these Beasts, for they cover themselves under willows and green hollow banks, till some people come to the Waters side to draw and fetch water, and then fuddenly, or ever they be aware, they are taken and drawn into the water. And also for this purpose, because he knoweth that he is not able to over-take a man in his course or chase, he taketh a great deal of water in his mouth, and casteth it in the path-wayer, fo that when they endevour to run from the Crocodile, they fall down in the flippery path, and are over-taken and destroyed by him. The common proverb also, Crecodili lachryme, the Crocodilis teass, justifieth the treacherous nature of this Beatt, for there are not many brute Beatts that can weep but fuch is the nature of the Crocodile, that to get a man within his danger, he will fob, figh; and weep, as though he were in extremity, but suddenly he destroyeth him. Others fay, that the Crotodile weeperh after he hath devoured a man. Howfoever it be, it noteth the wretched nature of hypornitical hearts, which before-hand will with faigned tears endevour to do mischief, or else after they have done it be outwardly forry, as Judas was for the betraying of Christ, before he went and hinged

The males of this kinde do love their females above all measure, yea even to jealouse, as may appear by this one History of P. Martyr. About the time that he was in those countries, therewere certain Mariners which faw two Crocodiles together in carnal copulation upon the fards neet the River, from which the water was lately fallen into a certain Island of Nilus, the greedy Mariners for fook their fhip, and betook themselves to a long boat, and with great shouting, holidwing and crying, made towards them in very couragious manner : the male at the first affault fell ams zed, and greatly terrified ran away as fast as he could into the waters, leaving his semalelying upon her back, (for when they ingender, the male turneth her upon her back, for by reason of the more neffe of her legs the cannot do it her felf) fo the Mariners finding her upon ther back and nor able to turn over her felf, they eafily flow her, and took her away with them. Soon after the mile returned to the place to feek his female, but not finding her, and perceiving bloud upon the fand, conjectured truly that the was flain, wherefore he prefently cafe himfelf into the River of this sgain, and in his rage fwam froutly against the stream untill ho over-took the fits wherein his deal female was, which he presently set upon, liking up himself and catching hold on the sides, would certainly have entered the lame, had not the Mariners with all their force battered his head and hands with clubs and staves, until he was wearyed and forced to give over his enterprise, and flowing great fighing and fobbing departed from them. By which relation it is mole clear whit natural after ction they bear one to another, and how they choose our their fellows, as it were fit wives and hulbands for procreation.

And it is no wonder if they make much of one another, for besides themselves they have see friends in the world, except the Bird Trechilm and Swine, of whom I can fay little and the Bird Trechilm a followeth. As for the little Bird Trachilm, it affecteth and followeth them for the benefit of his ownbelly; for while the Crocodile greedily eateth, there sticketh fast in his teeth some part of his prey, which troubleth him very much, and many times ingendereth Worms, then the Braft to belp himself taketh land, and lyeth gaping against the Sun-beams westward, the Bird perceiving it.

Byeth to the jaws of the Beaft, and there first with a kinde of tickling-scratching, procureth (as it were) licence of the Crocodile to pull forth the Worms, and so eateth them all out, and clenseth the teeth throughly, for which cause the Beast is content to permit the Bird to go into his mouth. But when all is clenfed, the ingrateful Grocodile endevoureth suddenly to shut his chaps together upon when all is ciefined, the light with the Bird, and to devour his friend, like a curfed wretch which maketh no reckoning of friendfhip, driftotle, the bit, the turn ferved, requiteth good with evill. But Nature hath armed this little Bird with flarp, Aristotle, but the turn ferved, requite the flow of the chorosupon her head to that while the Crocodile endewoureth to shut his chaps and close his mouth the chorosupon her head. The chorosupon her head to that while the Crocodile endewoureth to shut his chaps and close his mouth the chorosupon her head. thornsupon her near. To that wind the consumer to that full fore against his unkinde nature, he upon it, those sharp thorns prick him into his palate, so that full fore against his unkinde nature, he have whereas there he many kindes of Teachili which are greedy of these Leo Afric. letteth her flye lafe away. But whereas there be many kindes of Trochili, which are greedy of these Worms or clenfings of the Crocodiles, some of them which have not thorns on their heads pay for it, for there being not offence to let the closing of the Crocodiles mouth, they must needs be devoured: and therefore this enforced amity betwixt him and the Crocodile, is only to be understood of the Cledororynchue, as it is called by Hermolaus.

Of the Crocodile.

There be some that affirm, that he destroyeth all without exception that thus come into his Plutareb. mouth, and othersome say he destroyeth none, but when he feeleth his, mouth sufficiently clensed. he waggeth his upper chap, as it were to give warning of avoidance, and in favour of the good turn, to let the bird flie away at his own pleasure. Howbeit, the other and the former narration is more fikely to be true, and more constantly affirmed by all good Authors except Plutarch. And Lee Afric. faith, that it was the constant and confident report of all Africa, that the Crocodile devoureth all for their love and kindenesse, except the Cledororynchi, which they cannot, by reason of the thorns upon

That there is an amity and natural concord betwixt Swine and Crocodiles is also gathered, because Caleagninus. they only among all other living four-footed Beafts, do without danger dwell, feed and inhabit upon the banks of Nilm, even in the midft of Crocodiles; and therefore it is probable that they are friends in nature. But oh how small a sum of friends hath this Beast, and how unworthy of love amongall creatures, that never in nature hath but two, in heaven or earth, air or water, that will adventure to come neer it, and one of these also, which is the best deserving, it devoureth and destroyth if it get it within his danger.

Seeing the friends of it are so few, the enemies of it must needs be many, and therefore require Diod. Sicul. a more large catalogue or story. In the first rank whereof cometh, (as worthy the first place) the Ithneumon, or Pharaohs-moule, who rageth against their Egges and their persons, for it is certain that it hunteth with all fagacity of fense to finde out their nests, and having found them, it spoileth, scattereth, breaketh and emptieth all their egges. They also watch the old ones asleep, and Strabo. finding their mouths open against the beams of the Sun, suddenly enter into them, and being mall, creep down their vast and large throats before they beware, and then putting the Crocodile to exquisite and intolerable torment, by eating their guts a funder, and so their soft bellies, while the Crocodile tumbleth to and fro fighing and weeping, now in the depth of water, now on the land, never resting till strength of nature faileth. For the incessant gnawing of the Ichneumon so provoketh her to feek her rest in the unrest of every part, herb, element, throws, throbs, rowlings, toffings, mournings, but all in vain, for the enemy within her breatheth through her breath, and sporteth her self in the consumption of those vital parts, which waste and wear away by yeelding to unpacificable teeth, one after other, till the that crept in by stealth at the mouth, like a puny thief, come out at the belly like a Conqueror, through a passage opened by her own labour and indultry, as we have also shewed at large in the story of Ichneumon. But whether it be true or no, that the Trochilus doth awake the fleeping Crocodile, when he feeth the Ichneumon lie in wait to enterinto her, I leave it to the credit of Sirabo the reporter, and to the discretion of the indiffer-

Monkeys are also the haters of Crocodiles, as is shewed in the story, and lie in wait to difcover, and if it were in their power to destroy them. The Scorpionalso and the Crocodile'are enemies one to the other, and therefore when the Egyptians will describe the combat of two notable enemies, they paint a Crocodile and a Scorpion fighting together, for ever one of them killeth another: but if they will decipher a speedy overthrow to ones enemy, then they picture a Crocodile; if a flow and flack vistory, they picture a Scorpion. And as we have already shewed out of Philes. that out of the egges of Crocodiles, many times come Scorpions, which devour and destroy them

Fishes also in their kinde are enemies to Crocodiles, the first place whereof belongeth to the most noble Dolphin. Of these Dolphins it is thought there be two kindes, one bred in Nilus, the Other forrain and coming out of the Sea, both of them professed enemies to the Crocodile : for the first, it hath upon the back of it sharp thorny prickles or fins, as sharp as any spears point, which are well known to the fift that beareth them, as her armour and weapons against all adversaries. In the truft and confidence of these prickles, the Dolphin will allure and draw out the Crocodile from his den or lodging place, into the depth of the River, and there fight with him hand to hand. For the Dolphin as it knoweth his own armour and defence, like other Beafts and Fishes, so doth it know the weakest parts of his adversary, and where his advantage of wounding lyeth. Now, Strabs. ts we have faid already, the belly of the Crocodile is weak, having but a thin skin, and pene-Solinus. trable with small force, wherefore when the Dolphin hath the Crocodile in the midst of the deep waters, like one afraid of the fight, underneath him he goeth, and with his sharp fins or

prickles

ocodiles.
When Bibillus (a worthy Roman) was Governor of Egypt, he affirmed that on a feason the Dol. When Bibillus (a wortny Noman) was Sovether and bade battel the one to the other, as it were phins and the Crocodiles met in the mouth of Nilus, and bade battel the one to the other, as it were phins and the Crocodies met in the mount of the far p combat, it was feen how the Dolphins by for the foveraignty or the waters, and after that that he of the Crocodiles and the Crocodiles dyed by firokes rediving in the waters, and avoid the bitting of the declares, and when many of them were by this means as it were ceived from the Dolphins upon their bellies. And when many of them were by this means as it were ceived from the Dolphins upon their or hight, and ran away, giving way to the Dolphins, cent afunder, the refidue betook themselves to flight, and ran away, giving way to the Dolphins. cut aumaer, the residue betook talk with the Sea-hog, or Hog-fish, because of his brifles all about The Crocodiles do also fear to meddle with the Sea-hog, or Hog-fish, because of his brifles all about The Croconies at a mote at the man he cometh nigh him: or rather I suppose, asit is friend to the his head, which hurt him also when he cometh nigh him: or rather I suppose, asit is friend to the Swine of the earth, and holdeth with them a sympathy in nature, so it is unto the Swine of the water, and forbeareth one in the Sea, as it doth the other on the land.

ater, and iordearest one in the coasast among the Parthians, which is an enemy to the Cro.

There is likewise a certain wilde Ox or Bugil among the Parthians, which is an enemy to the Cro. There is incoming a certain winde of a configuration of the water, he is not only codile, for as Albertus writeth, if he finde or meet with a Crocodile out of the water, he is not only codile, for as Awertin writerin, it he since of the total hand with the weight and violent agitanot arrain of this, but taketh him all to pieces: and no marvail, for all Beafts are enemies to the Cro. codiles on the land, even as the Crocodile lyeth in wait to destroy all them in the water. Hiwksare codies on the land, even as the Closestily the Ibis bird, fo that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, fo that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, fo that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, fo that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, for that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, for that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, for that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, for that if but a feather of the Ibis comeupalfo enemies to Crocodiles, and especially the Ibis bird, for the Ibis bird on the Crocodile by chance, or by direction of a mans hand, it maketh it immoveable and cannot on the Crocount by Chance, or by antens will write or decipher a ravening, greedy, idle-fellow, they paint a Crocodile, having an Ibis feather flicking in his head. And thus much for the enmity betwirt

the Crocodiles and other living creatures.

It hath been feldom feen that Crocodiles were taken, yet it is faid that men hunt them in the waters, for Pliny faith, that there is an affured perswassion, that with the gal & fat of a Water-adder, men are wonderfully holpen, and ias it were atmed jagainst Crocodiles, and by it enabled to take and destroy them, especially when they carry also about them the herb Potamegeton. There is also akinde of thorny wilde Bean growing in Egypt, which hath many sharp prickles upon the stalks, this is a great terrour to the Crocodile, for he is in great dread of his eyes, which are very tender and easie to be wounded. Therefore he avoideth their fight, being more unwilling to adventure upon a man that beareth them, or one of them, then he is to adventure upon a man in compleat Armour, and therefore all the people plant great store of these, and also bear them in their hands when they

travail.

There be many who in the hunting and profecuting of these Crocodiles, do neither give themselves to run away from them, nor once to turn aside out of their common path or road, but in a foolish hardinesse, give themselves to combat with the Beast, when they might very well avoid the danger, but many times it hapneth that they pay dearly for their rashnesse, and repent too late the too much reputation of their own manhood: for whiles with their spears and sharp weapons they think to pierce his fides, they are deceived, for there's no part of him penetrable except his belly, and that he keepeth fafe enough from his enemies', blanting upon his scales (no leffe hard then plater of Iron) all the violence of their blows and thar pnesse of weapons, but clubs, beetles, and such like weapons are more irksome to him, when they be set on with strength, battering the scales to his body, and giving him fuch knocks as doth difmay and aftonish him. Indeed there is no great use of the taking of this Serpent, nor profit of merchandize cometh thereby, his skin and fiesh yeelding no

great respect in the world.

In ancient time they took them with hooks baited with flesh, or else inclosed them with nets as they do fifthes, and now and then with a strong Iron instrument cast out a boat down in the water upon the head of the Crocodile. And among all other there is this one worthy to be related. The Hunter would take off the skin from a Swines back, and therewithal cover his hook, whereby he allured and inticed the Serpent into the midft of the River, and there making it fast, he went afterward to the next watering place, and there holding another Hog, did beat and smite him, till he cryed ardently, with which voyce or cry, the Crocodile being moved, goeth presently to the bait and swalloweth it up, and maketh after the noise: at last, coming to the land, the Hunter with valiant courage and diligence, casteth mud and dirt into his eyes, and so blindeth him that he may oppressed

kill him with cafe.

Leo Afric. relateth also this means or way to take Crocodiles: There be many Treesplanted upon the banks of Nilue, unto one of these there is a long and strong rope tyed, and at the end of the same there is fastened a hook of a cubit long, and a finger in quantity: unto this hook for a bait is tyd a Ram or a Goat, which being fet close to the River, and tormented with the hook upon which its fastened, cryeth out amain, by hearing of whose voyce, the hunger-greedy Crocodile is raised on the hunger greedy Crocodile is raised on the hunger green green green greedy Crocodile is raised on the hunger green of his den, and invited as he thinketh to a rich prey, so he cometh (although it self of a trecherous nature, yet suspecteth not any other) and swalloweth the bait, in which he findeth a hook not to be digested. Then away he striveth to go, but the strength of the rope stayeth his journey, for as fast as the bait was to the rope and hook, fo fast is he also enfoared and tyed unto it, which which he waveth and fraineth to unloofe and break, he wearyeth himself in vain. And to the intent that all his strength may be spent against the tree and the rope, the Hunters are at one end thereof, and

cause it to be cast to and fro, pulling it in, and now letting it go again, now terrifying the Bealt with one noise and fear, and anon with another, so long as they perceive in him any spirit of moving or refistance : fo being quieted, to him they come, and with clubs, spears, beetles, staves and fuch manner of instruments, pierce through the most tenderest parts of his body and so destroy

Peter Martyr hath also other means of taking Crocodiles. Their nature is, that when they goe to the land to forrage and feek after a prey, they cannot return back again but by the fame footflens of their own which they left imprinted in the land : whereupon, when the Countrey people perceive these footsteps, instantly with all the hast they can make, they come with spades and mattocks and make a great ditch, and with boughs cover the same, so as the Serpent may not espy it, and upon the boughs they also again lay fand to avoid all occasion of deceit or suspicion of fraud at his return : then when all things are thus prepared, they hunt the Crocodile by the foor untill they finde him, then with noises of bells, pans, kerrels, and such like things, they terrific and make him return as fast as fear can make him run towards the waters again, and they follow him as neer as they can, mutil he falleth into the ditch, where they come all about him, and kill him with fuch inftruments or weapons as they have prepared for him, and to being flain, they carry him to the great City Cair. where for their reward they receive ten pieces of gold, which amounteth to the value of ten nobles

There have been some brought into that City alive, as P. Martyr affirmeth, whereof one was as much as two Oxen and two Camels could bear and draw, and at the fame time there was one taken by this devife before expressed, which had entered into a Village in Saetum neer Nilus, and swallowed un alive three young Infants fleeping in one Cradle, the faid Infants scarcely dead were taken again out of his belly, and foon after when no more tokens of life apppeared, they were all three buryed in abetter and more proper grave of the earth. Then also there was another flain, and out of his belly was taken a whole Ram not digested, nor any part of him consumed, and the hand of a woman which was bitten or torn off from her body above the wrift, for there was upon the same a Bracelet of

Braffe.

We do read that Crocodiles have been taken and brought alive to Rome. The first that ever Pline. brought them thither, was Marcus Scaurus, who in the games of his ædility, brought five forth and Capitolinus. shewed them to the people in a great pond of water, (which he had provided only for that time) and Lampidius afterward Heliogabalus and Antoninus Piw. The Indians have a kinde of Crocodile in Ganges, which bath a horn growing out of his nose like a Rhinocerot: unto this Beast they cast condemned men to be devoured, for in all their executions, they want not the help of men, leeing they are provided of Bealts to do the office of Hang-men.

Amelius Fessivus writeth, that Firmus a Tyrant of Egypt, being condemned to Nilus to be devoured by Crocodiles, beforehand bought a great quantity of the fat of Crocodiles, and so stripping himfelf flark naked, laid the fame over his body, fo he went among the Crocodiles and escaped death: for this favage Beast being deceived with the favour of its own nature, spared the man that had but so cunningly carryed it. And this is a wonderful work of Almighty GOD, that so order-Vadianus. eth his actions in the nature of this Beaft, that he beguileth the cruel nature of the living, by the talk and favour of the dead : howbeit some think that the water Crocodile is daunted with the favour of the fat from the land Crocodile, and the land Crocodile by the water again.

And some again say, that all venomous Beasts run away from the savour of the fat thereof; and Aetius. therefore no marvail if it also be asraid, being venomous as well as any other. Wherefore the faying of Firmus was not to be attributed to any indulgence of the Crocodile toward their own kinde, but rather to a deadly antipathy reflecting themselves upon themselves, though not in shape and figure as the Cockatrice, yet in sense, sayour, and rancknesse of their pestiferous humor.

The use of Crocodiles taken, is for their skin, flesh, caul and medicine arising out of it. Their P. Martyr. skin asitisexceeding hard upon their backs while they are alive, fo is it also when they are dead, for with that the common people make them better armour then coats of Mail, against Dirts, Spear, or Shield, as is well known in all Egypt at this day. For the flesh of Crocodiles, it is also caten among those people that do not worthip it : as namely the people about Elephantina Apollinopolis. Notwithstanding by the Law of God. Levit. 11. it is accounted an unclean Beatt, yet, the rast there- Herodotus. of being found pleasant, and the relish good, without respect of GOD or health, the common people make use thereof.

The medicines arising out of it are also many. The first place belongeth to the caul, which hath moe benefits or vertues in it then can be expressed. The bloud of a Crocodile is held profitable for many things, and among other it is thought to cure the bitings of any Serpent. Also by anginting Dioscorides. theyes, it cureth both the dregs or spots of bloud in them, and also restoreth soundnesse and clearneffeto the light, taking away all dulnesse or deadnesse from the eyes. And it is faid, that if a man pliny. take the liquor which cometh from a piece of a Crocodile fryed, and anoint therewith all his wound or harmed part, that then he shall be presently rid of all pain and torment. The skin both of the Arnoldus. land and water Crocodile dryed into powder, and the same powder with Vinegar or Oyl, laid upon a part or member of the body, to be feared, cut off, or lanced, taketh away all fenfe and feeling of pain from the instrument in the action.

Herodotus.

Diodorus.

Of the Crocodile

Aelius. Khuzes. All the Egyptians do with the fat or sewet of a Crocodile anoint all them that be lick of Feavers for it hath the same operation which the fat of a Sea-dog or Dog-fish hath,, and if those parts of men and beasts which are hurt or wounded with Crocodiles teeth, be anointed with this fat, it also cureth them. Being concocked with water and Vinegar, and so rowled up and down in the mouth, it cureth the tooth-ach; and also it is outwardly applyed against the biting of Flies, Spiders, Worms, and such like, for this cause, as also because it is thought to cure Wens; bunches in the slesh, and old wounds. It is sold dear, and held pretious in Alcair. Scaliger writeth, that it cureth the old wounds. It is sold dear, and held pretious in Alcair. Scaliger writeth, that it cureth the Gangren. The canine teeth which are hollow, filled with Frankincense, and tyed to a man or woman which hath the Tooth-ach, cureth them, if the party know not of the carrying them about. And so they write, that if the little stones which are in their belly be taken forth and so used, they work the same effect against Feavers. The dung is profitable against the falling off of the hair, and many such other things.

Aetius.

many juen other tunings.

The biting of a Crocodile is very sharp, deep, and deadly, so that wheresoever he layeth his teeth, feldom or never solloweth any cure. But yet the counsel of Physicians is, that so soon as the patient is wounded, he must be brought into a close chamber where are no windows, and there be kept without change of air, or admission of light, for the poyson of the Crocodile worketh by cold without change of air, or admission of light, for the poyson of the Crocodile worketh by air and light; and therefore by the want of both is to be cured. But for remedy (if any be) they prescribe the same which is given for the cure of the biting of a mad Dog, or (as Avien) the biting of a Dog not mad. But most proper is the dung of a man, the Fish Garum and Mysy pounded together, and so applyed, or else the broth of salt sod sless, and such other things as are vulgatly known they, and so applyed, or else the broth of salt sod sless, and such other things as are vulgatly known to every Physician: and therefore seeing we live in a countrey far from the annoyance of this Strpent, I shall not need to blot any paper to expresse the cure of this poyson.

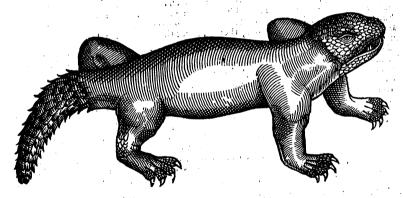

Belonius.

Arnoldus.

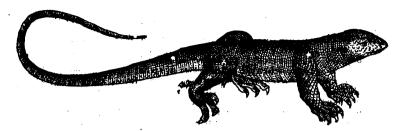

The Crocodile of Nilm only liveth on land and water, all other are contented with one element:

the picture of the Crocodile was wont to be stamped upon coin, and the skin hanged upin many sate picture of the Crocodile was wont to be stamped upon coin, and there is one at this day at Paris most Cities of the world, for the admiration of the people, and there is one at this day at Paris in France.

of the Arabian or Egyptian LAND CROCODILE.

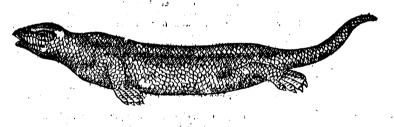

Nilw; and befide it is neither so tall or long as is the other, the which proportioned Bealt is only particular to Egypt and Arabia, and some because of his scaly head, legs, articles, and claws, have observed another difference in it from the former, yet in his nature, manner of living and preying upon other cattel, it differeth not from that of the water. The tail of this Crocodile is very sharp, and standeth up like the edges of wedges in bunches above the ground, where with when yery sharp, and shandeth up like the edges of wedges in bunches above the ground, where with like to make him go with his Rider to the place of his most fit execution, free from all refere of his y, to make him go with his Rider to the place of his most fit execution, free from all refere of his eth the limbs and parts one from another till he be devoured. The Apothecaries of liab have this Beast in their shops to be seen, and they call it Caudiverbera, that is, a Tail-bearer, for the reason aforesaid. And thus there being nothing in this Beasts nature different from the former, besides his green, and that which I have already expressed. I will not trouble the Reader with any more Narration about it.

The figure and proportion of this Serpent was altogether unknown in this part of the world, till of late our discoverers and Navigators brought one of them out of Brefilia. The length of itis about a fathom, and the breadth as much as ten fingers broad: the fore-legs have ten claws, five upon a foot, the hinder-legs eight, and both before and behinder they are of equal length. The tail exceeding long, far exceeding the quantity and proportion of his body, being marked all over with certain white and yellowish spots. The skin all covered with an equal, smooth and fine coloured scale, which in the midst of the belly are white, and greater then in other parts. It can shide no water, for a little poured into the mouth killed it, and after it had been two or three days dead, being brought to the fire, it moved and stirred again faintly, even as things do that lye a dying. It is not renomous nor burtful to eat, and therefore is digged out of his cave by any body safely without danger.

of the CROCODILE of the Earth called Scincus, a Scink.

There have been some that have reckoned Scinks and Lizards among Worms, but as the Greek words Erpetz, and Scoless, differ in most apparent dialoct, and fignification, and therefore it is an opinion not worth the confusing. for there are no Worms of this quantity. But for the better explication of the nature of this Beast, because some have taken it for one kinde, and some for asother; some for a Crocodile, and others for a Beast like a Crocodile; we are to know that there are three kindes of Crocodiles: the first is a water Beast or Serpent, and vulgarly termed a Crocodile, the strond is a Scink or a Crocodile of the earth, which is in all parts like that of the water, except in his colour and thicknesse of his skin; the third kinde of Crocodile inknown to us at this day, yet Phry and others make mention of it, and describe it to be a Beast hiving his scales like a Gorgon, growing or turning to his head from the tail, and not as others do, from the head to the tail.

The Grecians call this Beath Shiphos, and some unlearned A potheraries Stinems, and Myrepfus Sigk k in slic called Riberos, and the Bibrew, Roach, doth more properly fignific this Beath, then any other Crocodile or Chammeleon; or Lizard. Some of the Hibriws do expound Zab for a Seink; and from thence the Chabbers sind the Arabian have their Dad and Aldab, turning Zinto D: So, we read Guarik and Adbaya, for a Scink or Crocodile of the earth: Alarbian is also for the sume Serpent among the Arabians, Balecola, and Bulleoans Sebanehur, and Afebanehur, and Askinton, and Semanum, and Nudalep, and Nudalep, are all of them Syndaymans, or rather corrupted words for this Crocodile of the earth. But there are at this day certain Resubscink, set out to be seen and sold by Apothecaries, that are nothing else but a kinds of water Lizard: but the true difference is between them, that these water Lizards are venomous but this is not, and neither living in the Northern parts of the world, nor yet in the water: and so much shall suffice for the name and first entrance into this Serpents History.

They

They are brought out of the Eastern Countries or out of Egypt : yet the Monks of Mefuen affirm that they had feen Scinks or Crocodiles of the earth about Rome. Sylvations and Platearins in Applia. But howsoever their affections may lead them to conjecture of this Serpent, I rather believe that But howioever their affections may lead them for Europe. They love the banks of Rilus, although it is an African beaft, and feldom found in Asia or Europe. They love the banks of Rilus, although they date not enter the water, and for this caule fome have thought (but untruly) that when the they dare not enter the water, and for this cault folds there also engendered and hatched, and is a Crocodile layeth her egges in the water, the young is there also engendered and hatched, and is a Crocodile of the water, but if they lay their egges on the dry land, from thence cometh the Scink or Crocodile of the water, Dut if they lay then egges of the dry canfe that they never fay egs in the or Crocodile of the earth. This folly is evidently refuted, because that they never fay egs in the but all upon the dry land. They are found (as I have faid before) in Fg.pt., and also in Africk, and among the Lydians of Mauritania, otherwise called Lodya, or rather Lybia, among the Passoral or among the Ligital of Plow-men Africans; among the Arabians, and neer the Red-sea, for all those at this day fold at Venice, are brought from those parts. The greatest in the world are in India, (as Cardan teacheth) who are in all things like Lizards, faving in their excrements, which smell or sayour more strongly, and who are in an uning time of their quantity arifeth from the countrey which they inhabit, for in the generally the difference of their quality and the hotter dryer Region they are smaller, and generally the difference of their quality and generally difference of their quality difference of their qualit notter and monter country they are greatly in length, with an answerable proportionable body, nerally they exceed not two or three cubits in length, with an answerable proportionable body. which is thus described.

There be certain crosse lines which come along the back one by one; fomewhat white, and of a dusky colour, and those that be dusky have also in them some white spots. The upper part of the dusky colour, and those that be dusky have anore white, the feet and all the neather part of the neck is very dusky, the head and the tail are more white, the feet and all the neather part of the breast and belly are white, with appearance upon them of some scales, or rather the skin figured in the proportion of scales: upon either feet they have five distinct fingers or claws, the length of their legs is a thumb and a half : that is, three inches, the tail two fingers long, the body fix, lo that the whole length from the head to the tip of the tail, (which is first thick, and then very small at the end) is about eight fingers. When they have taken them they bowel them, and fill their bo. dies with Sugar, and Silk of Wooll, and so they sell them for a reasonable price. That which I have written of their length of eight fingers, is not fo to be understood, as though they never exceeded or came fhort of that proportion: for fometimes they are brought into these parts of the World twenty or four and twenty fingers long, fometimes again not above five or fix fingers

When they lay their Egges, they commit them to the earth, even as the Crocodiles of the water do. They live upon the most odoriferous flowers, and therefore is his flesh so sweet, and his dung or excrements odoriferous. They are enemies to Bees, and live much about Hives, infomuch as fome have thought they did lay their Egges in Hives, and there hatch their young ones: But the occation of this error was, that they faw young ones brought by their parents into some Hive, to feed upon the labouting Bee. For the compassing of their desire they make meal of any tree, which they have ground in the Mill of their own mouths, and that they mix with black Hellebore juyce, or with the liquor of Mallows, this meal fo tempered they lay before the Hives, whereof affoon as the Bees talt, they die, and then cometh the Crocodile with her young ones, and lick them up; and beside Bees, I do not read they are hurtful to any. The Indians have a little Beaft about the quantity of a little Dog, which they call Phattage, very like to a Scink or Crocodile of the earth, having sharp fcales, as cutting as a faw.

Ælianus. Rhazes.

Ariftotle.

There is some hurt by this beast unto men, for which cause I may justly reckon it among the venomous, for if it chance to bite any man, if the wounded man falleth into a Fever before he make water, he dyeth for it, but if he first make water, the beaft dyeth and the man escapeth.

It is thought that it containeth a kinde of natural magick, witch-craft, or forcery; and therefore they fay it hath a stupifying power, changing the minde from love to hatred, and from hatred to love again. The powder of this Serpent drunk in Wine, if it fir venereous luft, it hurteth the nerresand finews. There be certain magical devifes raifed out of this Serpent which are not worth the witting, as not having in them any dram of wit, learning, or truth; and therefore I will not trouble the Reader with them, but follow on the conclusion of this Crocodiles story in the Narraton of the medicinal vertues, which are far moe and more operative then those in the former Grocodile, for I think Almighty GOD bleffeth meeknesse and innocency with excesse of grace in men and beafts, as may be feen in thefe two kindes of Crocodiles, the dung and excrement of the one, being more worth then the body of the other, through harmleffe innocency.

The body of this Serpent to be dryed, after it hath lyen long in Salt, and to be preferred in Nofewort, as Ruellim and Marcellim write : (but truth is, there is no need of Salt where Nofewort is applyed, because the Acrimony of this hearb doth easily dry up the moisture of this beat, keeping Worms from breeding in it.) With the powder thus prepared, venereous men ftir up their lufts. M. thridate is called Diagencu, because it is compounded of the Scink or Crocodile of the earth, and it containeth in it a most noble Antidote against all poysons. Galen bad an Antidote against Storpions, which among other things containeth in it the fielh of a Crocodile of the earth, wherewithing cured all them that had been flung with Scorpions in Lybia. It is also good against the bitings of made beafts, and pleurifies; against poyloned Honey, or the crudity and loathing that cometh in the flow mack by eating of found Honey: It is profitable against empoysoned Arrows or Darts, being that immediately before or after the wound, as Apelles hath observed.

Strapio did make a medicine compounded of the dung of this Crocodile, and applyed the same against the Falling-sicknesse. Of the body of this Scink, except the head and seet being sod or rolled, and eaten by them that have the Schuld and side cough (especially children,) or the pain of rolled, and siveth them much ease. They are also mixed with medicines against the pain of the feet, the rect, as Galin did for Amarantus the Grammarian. They are also good in medicine against the coldnesse of the finews. This beaft is very hot, and therefore increaseth the seed of man, and provoketh luft; and for this purpose the greatest and fattest, and such a one as is taken in the Spring time, when they burn in luft for copulation, is preferred. But this is not to be meant of the fighty parts, but only of those parts that are about the reins, if a man drink thereof the weight of a groat in Wine afterwards, for the alaying of the hear thereof, the Physicians do prescribe a decoction of Lenriles with Honey, and the feed of Lettice drunk in Water. The mout of this Crocodile with the feet drunk in white Wine. Hath the same operation: but we have she well already, that these parts are to be cut off and thrown away, because it there be any venom in the beast it lyeth in

A perfume being made of the body and intrails of this Crocodile under the womb of a woman labouring with childe, is thought to yeeld much help, for her safe, speedy, and easie travail, or Hocks of Wool perfumed therewith, and laid to her belly. But it is the part of good Physicians to he warv in giving of medicines for firring up of luft in any, except in marrybd persons, and then also when they are young, to procure alawful ithis and posterity into the world & otherwise they shall both decay the body, for all violent helps of carnal copulation, do in the and prove detriments to nature, if they continue any time, and alforthey are hurtful couthe Soul, when not only the drings. ural defire of luft, bur alfo the intemperate pleasure of finish noveled thereby and thatie an incidence of the holy. Basides all kirleth the Soul to help one part of the hody. Basides all kirleth the foot modibines for this purpole, (amongst which this Crocodile is the chief) have their peculiar vertom, and when they areministred, either they have no effect at all through age or overmuch importancy, or elle they work too violently, which is most dangerous, or some one hurt or other followeth the poylon : and

in I will leave the profecution of this part,

The duft of the skin of this Gracodile being anointed with Vinegar or Oyl upon any part or member which is to be cut off, taketh away the fense of pain in the time of execution. The bloud is good for the eyes, and taketh away the filehy skin of the body, with the spotmand burls in the face, refloring the first, true, native, and lively colour, The fat taketh away the pain in the reins, and causeth a distillation of the seed of man; yet this fat touching the hair of a man, maketh it to fall off; and a man anointed herewith, is fafo from the annoyance of Crocodiles, although they play with him. It also cureth the bitings of Crocodiles , the infillation of this Crocodile, folded up in the Wooll of a black Sheepoof the first birth, and/whereinis no other colour, hath power to drive aquartane Ague. And Rhaft faith, that it being hung over the head of a woman in travail, keepeth her from delivery. In the gall of this Serpant there is a power against the falling off of the flair, especially if the medicine, be made of the poots of Beets to neese withall; and belides, the eyes beinganointed therewith, and with Honey, there is nothing more profitable against suffusions. The flones and reins have power, to provoke generation; and setim prescribethan Antidote to be made of the tail of this beaft, against the Gont.

Great is the vertue of the dung or excrement of this Serpent, if the same could be easily found, but while it is longht for, it lofeth the vertue! Lois called Crosedillo, and is profitable to give a good colour to womens faces, that is the best which is whitest, short, and not bedry, feeling like leaven betwixt the fingers, that is, finglling fomewhat fliarp like leaves.

It is adulterated with meal schalk, white benth, or painting but it is different by the heavineffe. The reason of the vertue of this is, because it feedeth upon the sweetest and belt smelling herbs, whereby it cometh to paffe, that it doth not dnly fmell fragrantly, but also contain in it many exrellent vertues. First cherefore it is good for the comelinesse of the face, to give votone to it, according to the laying of Harnes : Colorque Bereure fucetue Crosedili : A colour in-granned with the dang of a Crocodile; and for this cause also is the verse of Ouid, Nignor ad Marib confug pifes open. That is, The black Woman goedbro crave belp. of the Fift Pharim, to become more beautiful; for by the fifth tharing is understood a Crocodille. As some think jeight grains of this dung, or rather the weight of eight groats, with half to much Mulard-feed and Vinegar, currell the faiting off of the hir. Artidan doth prescribe, a composition of the dung and Canthatides offer the regenerating and bringing again of hair, that is detayed. If a perfume hereof be made and infuled by a Tantel into the holes of Serpents, it will drive shem away, by reason of the sharp, and leaven in favour Li the Pleathern perts ch

Tislianus maketh a medicite thereof for an Bye-falve against the whiteness and bloud eyes. It is good also against dimnesse and suffusions, being anointed with the juyor of Leeks : and to tone clude, it is drunk in fweet Wine and Vinegars, against the Falling-ficknesse, and Olfo being applied unto women, ftirreth up their monthly courses. And thus much that forfice for the Rolly of the l an referred into Gefore distributions and the parties of the above the state of t

results of Dominion of the second

Serapit

of the DART.

Mong the divers kindes of Serpents, there is one of special note, which the Gracians call don-A mong the Latines, Jaculares, or Jaculi, or Sagitta, a Dart or Arrow. The Gracians at this day Satta. The Turks, Orchilanne: In Calabria and Sicilia, Saettone, and of the Germans, Ein schoffe ider angelfob lang. The reason of this name is taken from his swift leaping upon a man to wound and kill him; and therefore the Poets say, Jaculiq; voluces, speaking of these kindes of Serpents. Albertow and Avicen also calleth them Cafezati, and Cafezati, Altararat, Acoran, and Altmani.

The manner of this Serpent is to get up into trees or hedges, and from thence to flielike an Arrow upon the upper parts of men, and fo to fling, bite, and kill them: and of this kindeit is thought that was, which came upon the hand of the Apofile Paul, whereof the Poet writeth;

Ecceprocul savus sterilis derobore trunci Torfit, & immifit (Jaculum vocat Africa) Serpens : Perque caput Pauli transactaque tempora fugit. In English thus :

Los from afar, a cruel Serpent from an Oke Came flying like a Dart, in Africa the lame A Dart is cald, the head and temples stroke Of Paul, by winding spires to work his bane: Nil ibi virus agit : rapuit cum vulnere fatum. Deprensum est, que funda rotat, quan lente volutent. Quam fegnis Scythica Strideret arundinis aer.

But nothing could the poyfon there avail, For with the wound he put away his death Faster then fwifteft flye, or turning ball, Or Scythian reed remov'd with winds breath.

Ther:

Marcellinus. Bellomus. O'am Mag.

This kinde of Serpent is for the most part in Lybia, in Rhodes, in Lemnus, in Italy, Calabia, and Sicilia, and in many of the Northern Countries, and also in Germany, whereof Gejner telleththis flory following. There is neer the Coasts of Zurick a River called Glat, and a Village or Townupon that River Giatfelden. Near this River, as a poor man was gathering wood, there was a Serpent of some three or four foot long, which from a tree endevoured to leap upon the poor man, by gathering his body together, (asitiwere into four spires or risings like half hoops) the man feeing it, left his lick and ran away : nevertheleffe, the Serpent leaped after him at the least fixteen or seventeen foot, but yet for that time he last turned about him, and not feeing the Serpent to follow him, gathered conrage and comfort, and would come back again for his fack that he had left behinde him. The crafty Serpent expecting fo much, had fet himfelf again in another tree, and privily lay till the man came for his fack, and then ere he was aware came flying at him as he did before, and prefently winded about his left arm; all his body except his tail hung down, and his neck which he held up hilling in the mans face : the man having no fleeve on his arm except his fhirt, yet did the Serpent to prefe the skin and fielh, that the circles of his winding fpires and prints of his body appeared therein after he was taken off, yet did he not bite the man, for the poor Countrey fellow did prefently with his other hand take him by head and caft him away, notwithstanding he had so folded himself about his arm t Mortly after that arm began to grow mattery, and all the flesh to the bone consumed yet was all the rotten putrified envenomed flesh and substance, by the skill of a worthy learned Physician taken away, and as good flesh brought in the room thereof as ever was before; yet was the man every year preferibed to let that arm bleed, and then iffued forth black thick bloud; some of the wounds or rather share, of the poyson outwardly remaining.

In the Northern parts they leap ten foot at a time, first gathering themselves into the similitudes of Bows or half hoopes, and then fight with those that they would devour, making many times? noise among the herbs or flowers; which are parched or withered by the Sun; and therefore by the bounty of GOD in nature, their own noise bewrayeth them to their suspicious adversaries and so many times are avoided in fasety. Like unto these are certain in Hungary, (as Johnnis Vitw reported unto Gefner,) whose bodies of an equal crassitude or thicknesse, so as they appear without tails, being for that purpose called Decurtait, Curtails, these in the same manner do lesp upon men as these Darters do, but they are very short, seldom exceeding the length of two bands

Olans Mag.

breadth.

Of the Diplas.

There is some difference among Authors about the nature of this Serpent : for Allana confoundeth it with the Snake of the Earth, called Charledun, and faith it liveth fometime in the wafoundation with the land, lying in wait to destroy all living creatures. And (he saith) it useth ter, and the fraud, it ever lyeth hid in secret neer the high-ways, and many times climbeth up into trees where it roundeth it self round into a circle, and hideth his head within the folds of his own body, so soon as ever it especth a Passenger, either a Man or Beast, it leapeth upon him own bouy, as Dart flyeth. For it is able to leap twenty cubin force, and fo lighting upon the Man or Bealt, sticketh fast unto it without falling off of his own accord, until they fall down dead.

But herein Elianus seemeth to be deceived, because he maketh but one Serpent of twain: namely, this Dart and the Land-fnake, which are most apparently different in nature, kinde, and

quality. deing also confoundeth this Serpeau with the Millet-ferpent, talled Crachring, and faith it is of the quantity of two cubits, great on the head, and the fore-part smaller at the tail, being of a greenish colour. And he faith further, that at fuch time as the Millet-feed groweth and flourisheth, this Sercent is most strong and hurtful, and so with the residue he agreeth with Atlant, but herein he is also deceived, writing by hear-fay as himself confesseth, and therefore it is more fase for us to have recourfe to some eye-witnesse for the description of this Serpent, then to stand upon the opinions of them which write by the relation of others.

Bellonius faith, that he faw one of thefe in Rhides, being full of small round black spots, not greater then the feeds of Lentiles, every one having a round circle about him like an eye, after fuch a fashion as is to be feen in the little Fifh called the Torpede. In length it exceedeth not three palms and in bignesseno greater then the little finger. It was of an Ash-colour; coming neer to the whitenesse of milk, but under the belly it was altogether white : upon the back it had scales, but upon the belly a thin skin, as in all other Serpents.

The upper part of the back was somewhat black, having two black lines in the middle, which begin at the head, and so are drawn along the whole body to the tail. As for the Cafezati, and Alteraidi or Altinayri, those are red Serpents, (as Avicen faith) which are but small in quantity, yet as deepand deadly in poyfon as in any other, for they hurt in the same manner that these Darts do. Some of them do fo wound with their poylon, as the afflicted person dyeth incontinent without fense or pain: Some again die by languishing pain after many hopes of recovery, losing life. Among all the people of the World, the Salean are most annoyed with this kinde of red Serpents; for they have many odoriferous and fweet smelling Woods, in the which these Serpents do abound, but such is their rage and hatred against men, that they leap upon them and wound them deadly, when soever they come within their compasse. And surely if it be lawful to conjecture what kinde of Serpents tholewere, which in the Scripture are called fiery Serpents, and did fling the Ifraelites to death in the Wildernelle, until the Brazen Serpent was erected for their cure; among all the Serpents in the world, that kinds of pain and death can be ascribed to none more properly then to these Cafezati, or Red-dart-ferments.

For first the Wildernesse which was the place wherein they annoyed the people, doth very well agree to their habitation. Secondly, those fiery Serpents are so called by figure, not that they were hery, but as all Writers do agree, either because they were red like fire; or else because the pain which they indicted, did burn like fire, or rather for both these causes together which are joyntly and leverally found in these red Serpents; and therefore I will conclude for my opinion, that these Serpents (as the highest poylon in nature) were lent by GOD to afflict the sinning Israelites, whose poylon was uncurable, except by Divine mirecle.

Mathilia also telletha story of a Shepheard which was slain in Italy by one of these, as he was fleeping in the heat of the day under the shadow of a tree, his fellow Shepheards being not far off looking to their flocks, fuddenly there came one of these Dart-Serpents out of the tree, and wounded him upon his left pap, at the biting whereof the man awaked and cryed out, and so dyed incontinently: his fellow Shepheards hearing this noise, came unto him to see what he ailed, and found him dead, with a Serpent upon his breaft; now knowing what kinde of Serpent this was, they for look their flocks and ran away for fear.

The cure of this Serpents biting, if there be any at all, is the same which cureth the Vipers, as Actim and Avicen writeth, and therefore I will not relate it in this place. The gall of this Beaft mixed with the Scythian Stone, yeeldeth a very good Eye salve. The which gell lyeth betwist the back and theliver: And thus much mall fuffice for this Sespent.

of the DIPSAS.

"His Diplas hath many names from many occasions: First Diplas in Greek signifieth thirst, as Sitis doth in Latine, and thereof also it is called Situla, because whosoever is wounded by this Serpent dyeth. It is also called by some Presser; and by some Causen, because it setteth the whole body on fire : but we shall show afterwards, that the Prefer is a different Serpent from this. It is called likewise Melmaru, because of his black tail, and Ammostis, because it lyeth in the fand, and there hurteth a man. It is not therefore unfitly defined by Avicen, to be

Of the Dipsas.

Vipera fillm faciens, that is, A Viper caufing thirft, and therefore Ovid porting at an old drunken woman named Lena, calleth her Diplas in thele verles ;

> Eft quedem nomine Dipfas anus. Ex re riomen babet, nigri non illa parentem Memmonis in refeis fobrie vidit equis. In English the; There is a woman old , which Diplas may be hight. And not without some cause, thirsty she ever it, For neith Memmons fire, all black and seldom bright, Did fie in water fweet behold in foberneffe.

They live for the most part neer the waters, and in falt marishy places; whereupon Licent faid :

-Stant in margine sicce Afides, & mediis sittebant Dipsades undis. That is to fay ; Woon pits brink dry Aspes there Stood, And Diplads thirft in midft of water fload.

It is called Torrida Dipfas, and Arlda Dipfas, because of the perpetual thirst, and therefore the Egyptians when they will fignific thirst, do picture a Dipfas: whereupon Lucianus relatest this story, there is (faith he) a statue or monument upon a Grave, right over against the great Sine betwist Silly and Egypt with this Epigram :

> Talia paffus erat quoque Tuntalus Æthiops ortus, Qui nullo petuit fonte levare sitim. Tale nec e Danao natas implere puellas Affiduis undis vas potuife reor. That is to fav: Such Tantalus indured in Æthiope bred; Which never could by water quench his thirst, Nor could the Grecian Maids with water fed, That with dayly pourings till the veffel curft.

The statue was the picture of a man like unto Tantalus, standing in the midst of a water redy to drink, by drawing in of the water, about whose foot was folded a Dipsas: close by stood certain women bringing water, and pouring it into him to make it run into his mouth; besides, there were certain Bgges as it were of Efriches lay pictured beside them, such as the Gerammu in Libia seek after. For it is reported by Lucianus, that the people of that Countrey do estnessly feek after the Estriches Egges upon the fands, not only to eat the meat that is in them, but allo to make fundry veffels or instruments of the shell, and among other things they make Caps of them. Near unto these Egges do these treacherous Serpents lie in wait, and so while the poor Countrey man cometh to feek for meat, suddenly he leapeth upon him, and giveth him a moral wound.

Alciatus hath an Embleme, which he feemeth to have translated out of Greek from Anipara Sidenius, of a Falconer, which while he was looking up after Birds for meat for his Hawk, suddenly a Diplas came behinde him and flung him to death. The title of his Embleme is, Qui alta contemple. tur cedere, he that looketh high may fall, and the Embleme it felf is this that followeth:

Dum turdos visco, pedica dum fallit alaudus, Et jasta altivolam figit arundo gruem, Dipfada non prudent auceps pede perculit, ultrix

Illa mali, emiffum virus ab ore jacit. Sic obit, extento qui sidera respicit arcu, Securus fati quod jacet ante pedet.

Which may be thus Englished;

Whiles Thrush with line, and Lark deceived with net, And Grane high flying pierced with force of reed, By Falconer was : behold a Dipfas on the foot did fet, As if it would revenge bis bloudy foul misdeed,

For payfon out of mouth it caft, and bit his feet, Whereof be dyed, like Birds by him destived, Whiles bending bow aloft unto the flats didlook, Saw not his fate below, which him of life bereaved.

This Diplas is inferior in quantity unto a Viper, but yet killeth by poylon, much more speedily, according to these verses;

> Exigue similis spectatur Dipsas echidna, Sed festina magis mors illus occupat agros. Parva & lurida cui circa ultima cauda nigrescit.

That into fay; This Dip as like unto the Viper for all But kills by stroke with greater pain and feed Whose tail at end is soft and black withall. That as your death avoid, with careful beed

It is but a short Serpent, and so small (as Arnoldu writeth,) it killeth before it be espyed, the length of it not past a cubit, the fore-part being very thick, except the head which is small, and so backward it groweth smaller and smaller: the tail being exceeding little, the colour of the forepart somewhat white, but set over with black and yellow spots, the tail very black. Galen writeth, that the ancient Marsi which were appointed for hunting Serpents and Vipers about Rome, did tell him that there was no means outwardly to distinguish betwixt the Viper and the Dipsas, except in the place of their abode, for the Diplas (he faith) keepeth in the falt places; and therefore the nature thereof is more fiery, but the Vipers keep in the dryer Countries, wherefore there are not many of the Diplades in Italy, because of the moistnesse of that Country, but in Lybia, where there are great store of falt marishes. As we have said already, a man or beatt wounded with this Serpent, is afflicted with intolerable thirst, insomuch as it is easier for him to break his belly, then to quench his thirst with drinking, always gaping like a Bull, casteth himself down into the water. and maketh no spare of the cold liquor, but continually sucketh it in till either the belly break, or the poyson drive out the life, by overcoming the vital spirits. To conclude, beside all the symntomes which follow the biting of Vipers, which are common to this Serpent, this also followeth them, that the party afflicted can neither make water, vomit, nor sweat, so that they perish by one of these two ways; first either they are burned up by the heat of the poyson, if they come not at water to drink, or else if they come by water, they are so unsatiable, that their bellies first swell above measure, and soon break about their privy parts. To conclude, all the affections which follow the thick poyfon of this Serpent are excellently described by Lucan in these verses following;

Signiferum juvenem Tyrrheni fanguinie Aulum Torta caput tetrò Dip as calcata momor dit. Vix dolor aut sensus dentis fuit : ipsaque leti Front caret invidia : nec quicquam plaga minatur. Ecce subit virus tacitum, carpitque medullas Ignin edax, calidaque incendit vi cera tabe. Ebibit humorem circum vitalia fusum Pellis. & in ficce linguam torrere palato Capit def: fos iret qui sudor in artus Non fuit, aique oculos lachrymarum vena refugit. Non decus imperii, non mæsti jura Catonis Ardentem tenuere virum, quin pargere figna

Tyribenian Aulus, the ancient-bearer young, Was bit by Dipfas, turning bead to beel, (frong, No pain or fenje of's teeth appear'd, though poyfon Death doth not fromn the man no barm did feel, But lee flee po) fon takes the marrow, and eating fire Burning the bowels warm till all consumed, Drinking up the humor about the vital fire, And in dry palat was the tongue up burned. There was no sweat the sinews to refresh, And lears fled from the vein that feeds the eyes, Then Catoes law, nor Empires honor fresh, Thu fiery youth could hold: but down the streamer flies,

Auderet, totifque furens exquireret agrie, Quas poscebat aquas, sitiens in corde venenum. lue vel in Tanaim miffus, Rhodanumque Padumque, Arderet, Nilumque bibens per rura vagantem : Accessit morti Libye : fatique minorem Famam Dipsas babet teriis adjuta perustis. Scrutatur venas penieus squallentis arena : Nunc redit ad Syrtes & fluttus accipit ore: Æquoreusque placet sed non & sufficit bumor. Nec fentit fatique genus, mortemque veneni : Sed putat effe fitim : ferroque aperire tumentes Sustinuit venas, atque os implere cruere. Lucan.lib.9. In English thus;

And like a mad man about the fields he runs, Poysons force in heart did waters crave : Though unto Tanais, Rhodanus, Padus be comes, Or Nilus : yet all too little for his heat to have. But dry was death, as though the Dipfas force Were not enough, but holp by heat of earth. Then doth he fearch the fands : but no remorfe, To Syrtes floud be bies bis mouth of them be filleth, Salt water pleaseth, but it cannot suffice, Nor knew he fate, or this kinde venoms death, But thought it thirst, and feeing his veins arise Them cut, which bloud floot mout b and breath.

The fignes of death following the biting of this Serpent, are extreme drought and inflamation both of the inward and outward parts, fo that outwardly the parts are as dry as Parchment, or as a skinfet against the fire, which cometh to passe by adustion and commutation of the bloud, into the nature of the poylon. For this cause many of the ancients have thought it to be incurable; and therefore were ignorant of the proper medicines, practifing only common medicines prescribed against Vipers: but this is generally observed, that if once the belly begin to break, there can be no cure but death. First therefore they use scarification, and make uition in the body, cutting off the member wounded. If it be in the extremity, they lay also playsters unto it, as Triacle, liquid Pitch with Oyl, Hens cut asunder alive, and so laid to hot, or esse the leaves of Pursiain batten in Vinegar, Barley meal, Bramble leaves pounded with Honey, also Plantain, Hysop, shire Garlick, Leeks, Rue and Nettles. Then must the government of their bodies be no lesse booked unto; first, that they be kept from all sharp and salt meats, then, that they be made Continually to drink Oyl, to procure vomit, and with their vomits which they cast out of their fomach, to give them glysters; that so the waters may be drawn to their lower parts. Besides,

Of the Dragon.

70

fome take medicines out of Fishes, especially such as are salt, and the leaves, bark, or springs of Laurel: and to conclude, there is nothing better then Triacle compounded of Vipers sless. And thus much for the Dipsas.

of the DOUBLE.HEAD.

Because the Grecians call this Serpent Amphibaina, and the Latines from thence Amphibana, because it goeth both ways, as if it had two heads and no tail: and for this purpose it is never seen to turn his body, as it were turn about his head. When it hath a purpose to avoid that thing which it search, or wherewithal it is offended, he doth but only change his course backward as he went forward; so that it is as happy as Lynceus, whom the Poets saign to be very quick-sighted, or as those Monsers which are said to have eyes in their backs, or rather like to Janus, which is said to have two faces, one forward, and another backward, and therefore I have called it Double-head, I have two faces, one forward, and another backward, and therefore I have called it Double-head, I trust fitty enough to expesse the Greek word, alt hough compounded of two words together, for so the Greek word also, which the French do expresse by a like compounded word, Double-marcheus, that is, going two ways. It is likewise called Ankessme, Alchismus, and Amphisiene. And thus much may so the compounded word.

It is faid that this Serpent is found in the Island Lemnus, but among the Germans it is unknown. It is faid that this Serpent is found in the Island Lemnus, but among the Germans it is unknown. There is fome question whether it may be faid to have two heads or no. Galen affirmeth, that it is like a Ship having two fore-parts, that is, one behinde, and another before. Pliny also subscribeth here unto, and maketh it a very pestilent Serpent, Geminum habet caput Amphisbana, tanquam paum esset, and ore fundi venenum, saith he; It hath a double-head, as though one mouth were not enough to

utter his poylon, according to the faying of the Poet :

Est gravis in geminum surgitis caput Amphis-benæ Serpens qui visu necat & sibilo. Which may be Englished thus; This Serpent Double head, is grievous to be seen, Whose cloven-head doub kill with sight and hissing keen.

Unto this also Ælianus subscribeth, that it is a true Serpent, and hath two heads, so that whensoever it is to go forward, one of them standeth in the place of the tail, but when it is to go backward, then the head becometh the tail, and the tail the head. So also Mantuan faith it is a double headed Serpent, and a fearful stinging Asp. And so generally all the Ancients, until Matthiolim and Greenus time, who first of all began to contrary this opinion, affirming it to be impossible in nature, for one Serpent to have two heads, except it be monstrous, and exceed the common course of nature. Such a one was that Serpent with two heads that Aristotle speaketh of, which doth easily happen to all those creatures which at one birth bring forth many young ones; for so their bodies may be conjoyned into one, while their heads stand asunder like twain. And they say that this Supent doth resemble a Worm of the earth, whose head and tail is hard to be distinguished asunder except you fee it going. And they say further, that this Serpent is like to the Soyial, of which we shall ipeak afterwards, differing from it in nothing except in going backward and forward, and this is all that they can bring against the opinion of the Ancients, whom I will not stand to confut, but leave the Reader to believe one or other: for it shall not bring to me any great disadvantage, except the loffe of this new English name, for I have dealt faithfully with the Reader in setting down the opinion of both fides, and if I do fail in a fit name, yet will I not fwerve from the best description of his nature.

The whole proportion of his body is of equal magnitude or greatness, and the two extremities do answer the middle. His eyes are for the most part shut, the colour like earth, not black, but tending to blacknesse, theskin rough and hard, and set over with divers spots: all which properties, or rather parts are thus described by Nicander.

Cujus perpetua est cacum caligine lumen, Quod latas utring; genas perrectag; menta, Terreus est illi color, & densissima pellis Plurima quam varii distinctam signa sigurant, Plus aliis alto Serpentibus aggeretendat.

In English thus:

Whole eye is ever void of light, because Two cheeks both broad and standing up it hides, The colour earth, thick skin, with spots in rows, Then other Serpents with greater bulk it glides.

Solinus Polibistor affirmeth, that they ingender and bring egges forth of the mouth, that is, out of that mouth which is toward the tail, if there be any such. There is no Serpent that doth more boldly adventure to indure the cold then this doth, for it cometh out of his den not only before other Serpents, but also before the Cuckoe sing, or the Grashopper cometh forth.

Tkey are exceeding

exceeding careful of their egges, and therefore feldom depart from them until they be hatched, whereby allo may be collected their great love to their young ones. And further, by their forward and timely coming out of their boles, Greving, maketh a good observation, that their temperament or constitution, is more hot then any other Serbent.

or constitution, shows all observed, that this kinde of Serpent is hard to be killed, except with a Vine-branch, which they say was demonstrated by Dionysius, who being turned by Juno into madnesse, one day falling fast asleep, this Serpent leaped upon him and awaked him, whereat he being angry, presently killed it with a Vine-branch. Some have affirmed that a small rod or bat covered with the skin of this Serpent; and so laid beside a man, driveth away all manner of venomous Beasts. A wilde Olive-branch or sprig wapped in this skin, doth cure the senselesse and benummed estate of the singers, and also is good for many things, as Nicauder expresses in these verses:

Hec ubi jam crevit, cadentes ligna coloni Settamdeglabrant oleastri ex arbore virgam, Quale pedum, strictifq; prebensi pellibus Anguia Insellam obvolvum, quas cerris deinde diebus Exarere sinunt, cantantes ante occadas. Villa bic baculm frigentibus artubus esse Fertur, ubi en añimis digitos torpedo fatigat, Tunc quia constrictos, & eorum vincula, nervos Calfacit immiss sovet entendita; calore.

Which may be Englished thus;
When this is grown, the Peasants cutting wood,
Do peel a branch taken from Olive-wilde,
Associately, of strained Snakes-skin good;
Rowling is up berein, till days fulfild,
By beat extend.

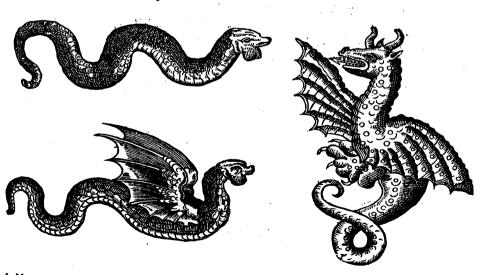

And let it dry before Grashoppers green: Thus made, it good for Sinews cold, Or nummed singers, whose force hash been By beat extending what cold hand did hold.

The wounds that come by the biting or stinging of this Serpent, are not great, but very small, and starcely to be discerned outwardly, yet the accidents that follow, are like to those which ensue the bitings of Vipers, namely, inflamation; and a lingering death. The cure thereof must be the same which is applyed unto the sting of Vipers. And peculiarly I finde not any medicine serving for the cure of this poyson alone, except that which Pliny speaketh of, namely Coriander drunk by the patient, or laid to the fore.

It is reported by Galen and Grevinus, that if a woman with childe do chance to go over one of these Double-headed Serpents dead, she shall suffer abortment, and yet that they may keep them in their pockets alive without danger in boxes. The reason of this is given by Grevinus, because of the vapour ascending from the dead Serpent, by a secret antipathy against humane nature, which suffocateth the

childein the mothers womb. And thus much for this Serpent.

of the DRAGON.

A Mong all the kindes of Serpents, there is none comparable to the Dragon, or that affordeth of: and yeeldeth so much plentiful matter in History for the ample discovery of the nature therefore herein I must borrow more time from the residue, then peradventure the Reader would

would be willing to spare from reading the particular flories of many other. But such is the neceswould be willing to ipare iron resume that it is the need-fity hereof, that I can omit nothing making to the purpose, either for the nature or morality of fity hereof, that I can omic norming maning of description pleasant, with variable history, seeing I may this Serpent, therefore I will strive to make the description pleasant, with variable history, seeing I may this Serpent, therefore I win title to the fweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in may not avoid the length hereof, that so the sweetnesse of the one, (if my pen could so expresse in my pen could so expresse in may not avoid the length hereof.) countervail the tediousnesse of the other.

ountervail the tediouineste of the other.

The Hebrews call it Thomas, and Wolphing translateth Oach a Dragon, in his Commentaries upon The Hebrews call it 2 panin, and it feemeth that the Greek word Drawn is derived of the Nebeniab. The Chaldes call it Darken, and it feemeth that the Greek word Drawn is derived of the Nebenitab. The Chalacer Call to Dr. Abedysimon; for a kinde of Dragon, and also Albatraf, and Chaldee. We read of Albedysimon, or Abedysimon; for a kinde of Dragon, and also Albatraf, and Chaldee. We read of Albeatinnon, of Sancosporate may be referred to this place. The Grecians at this Handen, Haren egenom, and such other terms, that may be referred to this place. The Grecians at this Hauden, Haren carnom, with the Lindswarm; the French, Un Dragon; the Italians, Drago, and day call it Drakes; the Germans, Trach Lindswarm; the French, Un Dragon; the Italians, Drago, and day call it Drager; the German, frack word, beside the conjecture afore expressed, fome think to be Dragone. The derivation of the Greek word, beside the conjecture afore expressed, some think to be Dragone. In e derivation of the or their vigilant eye-fight, and therefore it is faigned that they had the derived from Derkein, because of their vigilant eye-fight, and therefore it is faigned that they had the derived from pergent, because of the Golden-Recce, but also of many other treasures. And among other things, custody not only of the Golden-Recce, but also of many other treasures. Virgin Alciatus hath an emblem of their vigilancy standing by an unmarried Virgin.

Vera hac effigies innupte est Palladie : ejus Hic Draco, qui domina conftitit ante pedes. Cur Diva comes boc animal? custadia verum Which may be Englished thus;

Huic data, fie lucos fueraque templa colit. Innuptas opus eft cura affervare puellas Pervigili : laqueos undique tendit amor.

This Dragon great which Lady Pallas stands before. Is the true picture of unmarried Maids: But why a confort to the Goddesse is thir? and more Then other beafts more meek, who never fades ?

Because the safegard of all things belong to this, (fit. Wherefore his boufe in Groves and facred Temples Unmarried Maids of guards must never mille. Which watchful are to void loves fnares and net.

For this cause the Egoptians did picture Serapis their God with three heads, that is to fay, of a Lyon in the middle, on the right hand a meek fawning Dog, and on the left hand a ravening Wolf, all which forms are joyned together by the winding body of a Dragon, turning his head to the right hand of the God; which three heads are interpreted to fignific three times; that is to fay, by the Lyon the present time; by the Wolf, the time past; and by the fawning Dog, the time to come; all which are guarded by the vigilancy of the Dragon. For this cause also among the fixed Stars of the North, there is one called Draco, a Dragon, all of them ending their course with the Sun and Moon, and they are in this Sphear called by Aftronomers the Intersections of the Circles, the superior of these ascending, is called the head of the Dragon, and the inferior descending, is called the tail of the Dragon. And some think that GOD in the 38. of Job, by the word Grieif, meanth this Sign or Constellation.

To conclude, the ancient Romans (as Vegetins writeth) carryed in all their Bands the Elcutchion of a Dragon, to fignifie their fortitude and vigilancy, which were born up by certain men called for that purpose Draconarii. And therefore when Conflantius the Emperor entered into the City of Ram, his fouldiers are faid to bear up upon the tops of their spears, Dragons gaping with wide mouths, and made fast with golden chains and pearl, the winde whistling in their throats, as if they had been alive, threatning defruction, and their tails hanging loofe in the air, were likewise by the winde toffed to and fro, as though they strove to come off from the spears, but when the winde was laid, all their motion was ended, whereupon the Poet faith:

> Mansuescunt varii vento cessante Dracones. In English thus; When whistling winde in air ceast, The Dragons tamed then did reft.

The tale also of the Golden-fleece, if it be worth any place in this flory, deserveth to be inserted here, as it is reported by Diodorus Siculus. When Actes reigned in Pontus, he received an answer from the Oracle, that he should then dye when strangers should come thither with ships and setch away the Golden-fleece. Upon which occasion he shewed himself to be of a cruel nature, for he did not only make Proclamation that he would facrifice all strangers which came within his Dominions, but did also perform the same, that by the same and report of such cruelty, he might terrificall other Nations from having accesse unto that Temple. Not contented herewith, heraised agreat strong wall round about the Temple wherein the Fleece was kept, and caused a fure watch or guard to attend the same day and night, of whom the Grecians tell many strange sables. For they say there were Bulls breathing out fire, and a Dragon warding the Temple and defending the Fleece, but the truth is that these watchmen because of their strength were called Bulls, because of their countries that these watchmen because of their strength were called Bulls, because of elty, were faid to breath out fire, and because of their vigilancy, cruelty, strength and terror, to be Dragons.

Some affirm again, that in the Gardens of Hesperides in Lybia, there were golden Apples, which were kept by a terrible Dragon, which Dragon was afterward flain by Hercules, and the Apple taken away by him, and so brought to Eurystbeus. Others affirm that Hefferides had certain flocks of theep, the colour of whose wooll was like gold, and they were kept by a valiant shepheard called Drane, but I replies agree with a limit Draco: but I rather agree with Solinus, who giveth a more true reason of this sable, Ne same licents

vulneretur fides, left (as he faith) faith and truth should receive a difgrace or wound by the lavish report of fame. There was among the Hefferides a certain winding River coming from the Sea, and port or same including within it the compasse of that land which is called the Gardens of Hesperides, at one place whereof, the falling of the water broken by a Rock, feemeth to be like the falling down of Snakes, to them that stand a far off, and from hence ariseth all the occasion of the fable aforesaid.

Indeed there was a flatue of Hercules, in the left hand whereof were three Apples, which he was faid to have obtained by the conquest of a Dragon, but that conquest of the Dragon did morally fignific his own concupifeence, whereby he raigned over three passions; that is to say, over his wrath by patience; over his eupidity by temperance; and over his pleasures by labour and travail: which by patients, by patients, by patients, by patients, but I will flay my course from profecuting these moral distourses of the Dragon, and return again to his natural History, from which

Theve somewhat too long digressed.

There are divers forts of Dragons, diftinguished partly by their Countries, partly by their quanmy and magnitude, and partly by the different form of their external parts. There be Serpents in Arabia called Sirene, which have wings, being as fwife as Horles, running or flying at their own pleafure, and when they wound a man, he dyeth before he feeleth pain. Of these it is thought the Proohet Eja speaketh, chap. 13. vers. 22. Serpens clamabit in Templis voluptariis : and for Serpents the old Translators read Syrene, and so the English should be, the Syrene Dragons should cry in their Temples of pleasure: and the ancient distinction was, Angues aquarum, Serpentes terrarum, Dragones Temples was: that is to fay, Snakes are of the water, Serpents of the earth, and Dragons of the Temples. And I think it was a just judgement of God, that the ancient Temples of the Heathen Idolaters were annoyed with Dragons, that as the Devil was there worshipped, so there might be appearance of his person in the ugly form and nature of a Dragon. For God himself in holv Scriprire, doth compare the Devil unto a Dragon, as Rev. 12. verf. 3. And there appeared another wonder in Heaven, for behold a great red Dragon, having seven heads, and ten borns, and seven crowns upon his bead. Vers. 4. And his tail drew the third part of the stars of beaven, and cast them to the earth : and the Dragon fted before the Woman which was ready to be delivered, to devour ber childe when the had brought is forth. Verl. 5. So she brought forth a man childe, which should rule all Rutions with a rod of Iron. And her Son was taken up unto God and to his throne. Verl. 6. And the Woman fled into the Wildernelle, where the both a place prepared of God, that they flouid feed her there 1260 days. Verf 7. And there was a battail in brown, Michael and his Angels fought against the Dragon, and the Dragon fought and his Angels. Verf. 8. But they prevailed not, neither was their place found any more in heaven. Verl. 9. And the great Dragon that old Serpent called the Devill and Satan, was cast out, which deceiveth all the world, he was even cast unto the earth and his Angels were cast out with him. Verf. 13. And when the D ragon faw that he was cast unto the enth, beperfecuted the Woman which had brought forth a man-childe: and to forth, as it followeth in the Text. Whereupon Saint Augustine writeth, Diabolus Draco dicitur propter insidias, quia occulte insidiatur : that is, the Devill is called a Dragon because of his treachery, for he doth treacherously set upon

It was wont to be faid, because Dragons are the greatest Serpents, that except a Serpent eat a Ser- Elianus. pent, he shall never be a Dragon : for their opinion was, that they grew so great by devouring others of their kinde; and indeed in Ætbiopia they grow to be thirty yards long, neither have they any other name for those Dragons but Elephant-killers, and they live very long.

Onescrittu writeth, that one Aposisares an Indian, did nourish two Serpents Dragons, whereof one was fix and forty cubits long, and the other fourfcore: and for the more famous verification of the fact, he was a very earnest futer to Alexander the Great, when he was in India, to come and fee them, but the King being afraid, refused.

The Chroniclers of the affairs of Chim do write, that in a certain Valley neer to the foot of the Mountain Pellenaus, was a Valley full of fraight tall trees, wherein was bred a Dragon of wonderful magnitude or greatnesse, whose only voyce or histing, did terrificall the Inhabitants of Chim, and therefore there was no man that durst come nigh unto him, to consider or to take a perfect view of his quantity, suspecting only his greatnesse by the loudnesse of his voyce, until at length they knew him better by a fingular accident worthy of eternal memory. For it hapned on a time that such a violent winde did arise, as did beat together all the Trees in the Wood, by which violent colblion the branches fell to be on fire, and so all the Wood was burned suddenly, compassing in the Dragon, whereby he had no means to escape alive, & so thetrees fel down upon him and burned him. Afterward, when the fire had made the place bare of wood, the Inhabitants might fee the quantity of the Dragon, for they found divers of his bones and his head, which were of such unusual greatnelle, as did fufficiently confirm them in their former opninion: and thus by divine miracle was this monfier confumed, whom never any man durst behold being alive, & the Inhabitants of the Countrey fafely delivered from their just conceived fear.

It is also reported, that Alexander among many other Beasts which he saw in India, did there finde in a certain den a Dragon of feaventy cubits long, which the Indians accounted a facred Beast, and therefore intreated Alexander to do it no harm. When it uttered the voyce with full breath, it terrified kind the standard of the standard fied his whole Army: they could never see the proportion of his body, but only the head, and by that they guessed the quantity of the whole body, for one of his eyes in their appearance seemed as great as a Macedonian buckler. Maximus Tyrius writeth that in the days of Alexander, there was likewife feen a Dragon in India, as long as five roods of lands are broad, which is incredible. For he

Stu npfius.

likewise faith that the Indians did feed him every day with many several Oxen and Sheep. It may be that it was the same spoken of before, which some ignorant men, and such as were given to set forth sables, amply fied beyond measure and credit.

bles, amplyined beyond measure and election.
Whereas Dragons are bred in India and Africa, the greatest of all are in India, for in Acibiopia, Nu. Whereas Dragons are pred in amount and appropriate the length of five cubits and twenty cubits; for in bia, and H. Bria, the Dragons are confined within the length of five cubits and twenty cubits; for in bia, and Hip tia the Diagons are continued that the Egypt, one was nine cubits long, which with great the time of Europet 1, there were three brought into Egypt, one was nine cubits long, which with great the time of Europe cubits long. the stime of Euroget 1, there were three brought the other two were feaven cubits long. About the care was nourthed in the Temple of Esculation, the other two were feaven cubits long. About the care was nourined in the rempie of Estates and are Dragons of great quantity, and under the place where once the Tower of Babel was builded, are Dragons of great quantity, and under the place where once the 1 ower of bust was butter, there are Serpents as thick as beams, in telimony where. Equinoctial, as exicerous and the same and therefore it is no marvail, although S. Austine writer skins have been brought to Rome. And therefore it is no marvail, although S. Austine writer of their skins nave been of ong the congress magna quedam junt animantia, majora non junt sing upon the 148. Pialm, doth fay, Dracones magna quedam junt animantia, majora non junt super terram; ting upon the 140. Flaint, wett any) and there are none greater upon the earth. Neither is it to be Dragons are certain great beauty, and Antilius Regulus did kill a Dragon which was a hundred and thought incredible, that the fouldiers of Antilius Regulus did kill a Dragon which was a hundred and thought increasible, that the Dragons in the dens of the Mountain Atlas, fhould grow fo great that twenty foot long, or that the Dragons in the dens of the Mountain Atlas, fhould grow fo great that twenty root long, of that the Dragons in their body. I am yet therefore to speak of the Dragons in they can scarse move the fore-parts of their body. I am yet therefore to speak of the Dragons in they can tear is move the role of Atigia, or of Dachinabades, or the Regions of the Baft, or of that which the mountains amount of the people of Rome, being fifty cubits long; or of those which be Augustus showed publiquely to the people of Rome, being fifty cubits long; or of those which be in the Alpes, which are found in certain Cayes of the South-fides of the hills, fo that this which ant the Auges, which all suffice for the quantity and Countries of Dragons. Besides, there are other hath been said, shall suffice for the quantity and Countries of Dragons. hath been laid, man mine to the quantity and fir R of all of the Epidaurian Dragons, which kindes of Dragons which I must speak of in order; and fir R of all of the Epidaurian Dragons, which is bred no where but in that Countrey, being time, and of yellow golden colour, wherefore they were dedicated to Afculapus, of whom Nicander writeth in this manner.

ated to Asculapius, of whom Ascanner Wittern in tenena Draconem
Appice, quem patula sago Phæteia proles
In gelido Peli nutrivit culmine, juxia

Leta Peleihunia quondam declivia valla.
In English thus;
After these venoms now behold the Dragon black and green,
Neurished by Apollus jon under a Beech ful broad,
On top of the cold Pelus, in often hath been seen,
By sertil vale of Peleihun bu sliding road.

There are likewise other kinde of fame Dragons in Macedonia, where they are so meek, that women seed them, and suffer them to suck their breasts like little children their Infants also play with them, riding upon them and pinching them, as they would do with Dogs, without any harm, and sleeping with them in their beds. But among all Dragons, there was none more famous then the Dragon Python, or Pythias, as the Poets saign, which was bred of the slime of the earth, after the flood of Deucelion, and slain afterwards by Apollo, whereof there lyeth this tale: That when Latina was with childre by Jupiter of Apollo and Diana, Juno resisted their birth, but when they were born and laid in the Cradie, she sent the Dragon Python to devour them, Apollo being but a young lisant, did kill the Dragon with a dart. But this tale seemeth too sabulous and incredible, and therefore they have mended the matter with another device; For they say that Python by the commandment of Jua, did persecute Latona throughout all the world, seeking to devour her, so as she had no rest until the came unto her sister Assertia, who received her into Delos, where she was safely delivered of Allo and Diana. Afterward, when the childe was grown up, he slew the Dragon in remembrance and trend and Macrobius, to be thus; That Apollo killed one Python, a very wicked man in Delphos, and that the Poets in excuse of the sact, did saign him to be a Dragon, as aforesaid. And so I shall not need to say any more of Python, except these verses following out of Ovid about his generation:

Sed te quoq; maxima Python,
Tum genuit populifq, novis incognite Serpens
Terror eras: tantum fpairi de monte terebas.
Hunc Deus arcitenens & nunquam talibus armis
Autè, nifi in damis, caprifque fugacibus ufus:
Mille gravem telis exhauftapene pharetra

Perdidit effuso per vulnera nigra venem. Neve operus famam posset delero vetusis, Instituit sacros celebri certamine ludos Pythia perdomita Serpentis nomine dillos Caruleus tals prostratus Apoline Pythm.

Which may be Englished thus;

But yet thou ugly Pythou wert engendered by her, tho
A terror to the new-made-folk, which never erst had known,
So foul a Dragon in their life so monstrously fore-grown,
So great a ground thy poyson'd paunch did underneath thee hide,
The God of shooting, who no where before that present tide
Those kinde of weapons put in ure but at the speckled Deer,
Or at the Roes so light of soot, a thousand shafts well neer

Of the Dragon.

Did on the hideous Serpent pend, of which there was not one But forced forth the venored-bloud, along his sides to gone: So that his quiver almost void, he naild him to the ground, And did him nobly at the last by force of shot confound, And less that time should by this work desace the worthy same, He did ordain in minde thereof a great and solemn game, Which of the Serpent that he slew, of Python have the name.

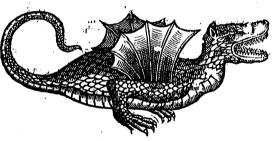

Of the Indian Dragons there are also said to be two kindes, one of them fenny, and living in the marishes, which are flow of pace and without combes on their heads like females: the other in the sountains, which are more sharp and great, and have combes upon their head, their backs being somewhat brown, and all their bodies less fealy then the other. When they come down from the sountains into the plain to hunt, they are neither afraid of marishes nor violent waters, but thrust dies then the Dragons of the sens, they beguile them of their meat, and take away from them their prepared booties. Some of them are of a yellowish siery colour, having also sharp backs like saws; eyes are precious stones, and when they set up their scales they shine like sliver. The apples of their many diseases, and therefore they bring unto the Hunters and killers of Dragons no small gain, besides the profit of their skin, and their teeth: and they are taken when they descend from the Hunters.

Their members are very great, like unto the members of the greatest Swine, but their bodies are leaner, stexibly turning to every side, according to the necessary of motion: Their shouts are very strong, resembling the greatest ravening Fishes; they have beards of a yellow golden colour, being still of bristles: and the Mountain-dragons commonly have more deep eye-lids then the Dragons of the Fens. Their aspect is very sterce and grim, and when soe they move upon the earth, their eyes wenture into the Sea and take Fishes.

of the WINGED DRAGON.

There be some Dragons which have wings and no feet, some again have both feet and wings, and some neither feet nor wings, but are only diftinguished from the common fort of Serpents by the combe growing upon their heads, and the beard under their cheeks.

Saint Augustine faith, that Dragons abide in deep Caves and hollow places of the earth, and that fometimes when they perceive moistnes in the air, they come out of their holes, & beating the air with their wings, as it were with the strokes of Oars, they

for fake the earth and flie aloft: which wings of theirs are of a skinny substance, and very voluble, and spreading themselves wide, according to the quantity and largenesse of the Dragons body, which caused Lucan the Poet in his verses to write in this manner following:

The Inhabitants of the Kingdom of Georgia, once called Media, do say that in their Vallies there are divers Dragons which have both wings and feet, and that their feet are like unto the feet of Geese. Besides, there are Dragons of sundry colours, for some of them are black, some red, some of an association, some yellow, and their shape and outward appearance very beautiful, according to the verses of Nicander.

Polinofu apparet species pulchro illius ore, Tripice chispicui se produni ordine dentes, Which may be Englished thus :

Their form of presence outwardly appears All beautiful, and in their goodly mouth Their teeth fand double, all one within another : Conspicuous order so doth berray the truth.

Magna sub egregia scintillant lumina fronte. Tindag: felle tegunt imum palearia mentum.

Under their brows, which are both great and wide. Stand twinckling eyes, as bright as any flar, With red galls tindure are their dewlaps dyed. Their chinor under-chap to cover far.

Gillius, Pierius, and Grevinus, following the authority of this Poet, do affirm that a Diagon is of a Gillus, Fierus, and Orevinus, tollowing, and very beautiful to behold, having a treble row of teeth black colour, the belly fomewhat green, and very beautiful to behold, having a treble row of teeth black colour, the peny louiseway and with most bright and cleer seeing eyes, which caused the Poets in their mouths upon every jaw, and with most bright and cleer seeing eyes, which caused the Poets in their mouths upon every jaw, that these Dragons are the watchfull keepers of Treasures. They have to faign in their writings, that these Dragons are the watchfull keepers of Treasures. They have to taign in their writings, under their chin, and hanging down like a beard, which are of a red colour: allo two newiaps growing with very sharp scales, and over their eyes stand certain flexible eye-lids, their bodies are set all over with very sharp scales, and over their eyes stand certain flexible eye-lids. their bodies are let an over which their mouth, and thrust forth their tongue, their teeth seem very much to resemble the teeth of wilde Swine: And their necks have many times grosse thick hair growing upon them, much like unto the briftles of a wilde Boar.

on them, much me unto the most tameable Dragons) is but little, not much bigger then a pipe, through which they draw in their breath, for they wound not with their mouth, but with their tails only beating with them when they are angry. But the Indian, Æthiopian, and Phrygian Dragons. have very wide mouths, through which they often fwallow in whole fowls and beafts. Their tongue is cloven as if it were double, and the Investigators of nature do say, that they have fifteen teeth of a side. The males have combes on their heads, but the females have none, and they are likewise diffin-

guished by their beards.

They have most excellent senses both of seeing and hearing, and for this cause their name Drakin cometh of Derkein, and this was one cause why Impiter the Heathens great God, is said to be metamorphosed into a Dragon, whereof their flyeth this tale : when he fell in love with Profespine, he ravished her in the likenesse of a Dragon; for he came unto her and covered her with the spires of his body; and for this cause the people of Sabanii did observe in their mysteries or sacrifices the shape of a Dragon rowled up within the compasse of his spires: fo that as he begot Ceres with childe in the likenesse of a Bull, he likewise deluded her daughter Proserpina in the likenesse of a Dragon; but of these transmutations we shall speak more afterwards, and I think the vanity of these took first ground from the Africant, who believe that the original of Dragons took beginning from the unnatural conjunction of an Eagle and a she Wolf. And so they say that the Wolf growing great by this conception, doth not bring forth as at other times, but her belly breaketh and the Dragon cometh out, who in his beak and wings resembleth the Dragon his father, and in his feet and tail, the Wolf his mother, but in the skin neither of them both : but this kinde of fabulous generation is already fufficiently confuted. Their meats are fruits and herbs, or any venomous creature, therefore they live long without food, and when they eat, they are not easily filled. They grow most fat by eating of egges, in devouring whereof they use this Art, if it be a great Dragon, he swalloweth it up whole, and then rowleth himself, whereby he crusheth the egges to pieces in his belly, and so nature calleth out the shells, and keepeth in the meat. Buy if it were a young Dragon, as if it be a Dragons whelp, he taketh the egge within the spire of his tail, and so crushed it hard, and holdeth it fast, untill his scales open the shell like a knife then sucketh he out of the place opened all the meat of the egg. In like for do the young ones pull off the feathers from the fowls which they eat, and the old ones swallow them whole, casting the feathers out of their bellies again.

The Dragons of Phrygia when they are hungry, turn themselves towards the West, and gaping wide, with the force of their breath do draw the Birds that flie over their heads into their throats, which some have thought is but a voluntary lapse of the Fowls, to be drawn by the breath of the Dragon, as by a thing they love, but it is more probable, that fome vaporous and venomous breathis fent up from the Dragonto them, that poyfoneth and infecteth the air about them, whereby their senses are taken from them, and they aftonished fall down into his mouth. But if it fortune the Dragons finde not food enough to satisfie their hunger, then they hide themselves until the people be returned from the market, or the heard-men bring home their flocks, and upon a fudden they devour either Men or Beafts, which come first to their mouths : then they go again and hide themselves in their densand hollow Caves of the earth, for their bodies being exceeding hot, they very feldom come out of the cold earth, except to feek meat and nourishment. And because they live only in the hottest Countries, therefore they commonly make their lodgings neer unto the wa-

ters, or else in the coldest places among the rocks and stones.

They greatly preserve their health (as Aristotle affirmeth) by eating of wilde Lettice, for that they make them to vomit, and cast forth of their stomach whatsoever meat offendeth them, and they are most specially offended by eating of Apples, for their bodies are much subject to be filled with winde, and therefore they never eat Apples, but first they eat wilde Lettice. Their fight also (# Plutarch faith) doth many times grow weak and feeble, and therefore they renew and recover the same again by rubbing their eyes against Fennel, or else by eating of it.

Their age could never yet be certainly known, but it is conjectured that they live long. great health, like to all other Serpents; and therefore they grow fo great. They do not only live on the land, as we have faid already, but also swim in the water, for many times they take the Sea in Elbiopia, four or five of them together, folding their tails like hurdles, and holding up their heads, to fwim they over to feek better food in Arabia.

Of she Dragon.

We have faid already, clid when they fet upon Elephants, they are taken and killed of men : now the manner how the Indian Kill the Mountain Dragous is thus; they take a garment of Scarlet, and the manner now the amening of the letters, this they lay upon the mouth of the Dragons den, for with the red colour and the gold, the eyes of the Dragon are overcome, and he falleth afleep, the with the red color and the government and muttering ferretly words of Incantation; when they perceive he is fast asleep, suddenly they strike off his neck with an Ax, and so take out the balls of his eyes, wherein are lodged those rare and precious fromes which contain in them vertues unutterable, as hath been evidently proved by one of them, that was included in the Ring of Gyes. Many times it falleth out, that the Dragon draweth in the Indian both with his Ax and Instruments into his den, and there devoureth him, in the fage whereof, he so beateth the Mountain that it shaketh.
When the Dragon is killed, they make use of the skin, eyes, teeth, and slesh; as for the slesh, it is of a vitrial or glaffie colour, and the Æthiopians do eat it very greedily, for they fay it hath init a refrigerative power. And there be some which by certain inchanting verses do tame Dragons, and rideth upon their necks, as a man would ride upon a Horse, guiding and governing them with

Now because we have already shewed, that some Dragons slave wings, lest it should seem uncredible, as the foolish world is apt to believe no more then they see, I have therefore thought good to add in this place, a particular relation of the testimonies of fundry learned men, concerning these winged in this place, a particular assistance and Megasibenes writeth, that in India there be sertain flying Serpents, Ellanus. which hurt not in the day, but in the night time, and these do render or make a kinde of urine, by the touching whereof, all the parts of mortal creatures do rot away. And there is a Mountain which divideth a funder the Kingdom of Narfinga from Alabarie, wherein be many winged Serpents fitting upon trees, which they say poyson men with their breath. There be many pestilent winged Ellanus.
Serpents which come out of Arabia every year by troups into Egypt, these are destroyed by a certain Elevodaus. black Bird called Ibis, who fighteth with them in the defence of that Countrey where she liveth, so that there lie great heaps of them many times destroyed upon the earth by these Birds, whose bodies that there he great neaps of them many times destroyed upon the earth by these binds, whose boules may be there visibly seen to have both wings and legs, and their bones being of great quantity and stature, remain unconsumed for many years after. These kinde of Serpents or Dragons, cover to keep about Trees of Frankincense which grow in Arabia, and when they are driven away from thence with the fume or smooth of Stirax, then they slie (as is aforesaid) into Egpt, and this is to be considered, that if it were not for this Stirax, all that Countrey would be consumed with

Neither have we in Europe only heard of Dragons and never feen them, but also even in our own Country, there have (by the testimony of sundry Writers) divers been discovered and killed. And first Brodem. of all, there was a Dragon or winged Serpent brought unto Francis the French King, when he lay at Scaliger. Southen, by a certain Countreyman, who had flain the same Serpent himself with a Spade, when it fetupon him in the fields to kill him. And this thing was witnessed by many learned and credible men which faw the same : and they thought it was not bred in that Countrey, but rather driven by the winde thither from some forain Nation. For France was never known to breed any such Monsters. Among the Pyrenes alfo, there is a cruel kinde of Serpent, not path four foot long, and as thick as a mans arm, out of whose sides grow wings much like unto griftles.

Offer also faith, that in the year of our Lord 1543, there came many Serpents both with wings and legs into the parts of Germany neer Stiria, who did bite and wound many men incurably. Cardan alfo describeth certain Serpents with wings, which he saw at Paris, whose dead bodies were in the hands of Gulielmus Musicue, he faith that they had two legs and small wings, so that they could farce flie, the head was little, and like to the head of a Serpent, their colour bright, and without bair or feathers, the quantity of that which was greateft, did not exceed the bignesse of a Cony, and it is faid they were brought out of India. Besides, a surther consistmation of these Beasts, there Crinius. have been noted in all ages; for it is written in the Roman Chronicles, the times of their apparition

When the River of Tiber over-flowed above the banks, then were many Serpents discovered, and many Dragons, as in the time of Mauritius the Emperor, at what time a Dragon came along by the City of Rome, upon the waters in the fight of all men, and fo passed to the Sea: after which prodisy, there followed a great mortal pestilence. In the year 1499, the 26. day of May, there came a Stumpfius. Dragon to the City of Lucerne, which came out of the Lake through Rula, down along the River, many people of all forts beholding the fame.

There have been also Dragons many times seen in Germany, stying in the air at mid-day, and signifying great and fearful fires to follow, as it happened neer to the City called Niderburge, neer to the thore of the Rhene, in a marvellous clear Sun-shine day, there came a Dragon three times suctessively together in one day, and did hang in the air over a Town called Santingarin, shaking his tail over that Town every time: ic appeared visibly in the fight of many of the Inhabitants, and afterwards it came to passe, that the said Town was three times burned with fire, to the great harm and

unto ne of all the people dwelling in the same : for they were not able to make any resistance to quentialle fire, with all the might, Art, and power that they could raise. And it was further obdienen ene, with an the might, Alexandr Dragons leen washing themselves in a certain Fountered, that about that time there were many Dragons leen washing themselves in a certain Fountain or Wellness the Town, and if any of the people did chance to drink of the water of that Well tain or Wellness the Town, and if any of the people did chance to drink of the water of that Well tain or Well neer the Town, and if any of the people did chance to drink of the water of that Well, their bellies in that the begin to swell, and they dyed as if they had been poyfoned. Whereupon it was publiquely decreed, that the faid Well should be filled up with stones, to the intent that never any man should afterwards be poyfoned with that water; and so memory thereof was conver any man should afterwards be poyfoned with that water; and so memory thereof was convertined, and these things are written by full him. Golden, in an Epistle to Gener, assuming that he did not write saigned things, but such things as were true, and as he had learned from men of great honesty and credit, whole eyes did see and behold both the Dragons, and the mishaps that follow-

by nre. When the body of Cleomenes was crucified, and hung upon the Croffe, it is reported by them that When the body or the watch-men about it, that there came a Dragon and did winde it felf about his body, and were the watch-men about it, that there came a Dragon and did winde it felf about his body, and were the watch-men about it, that the tracking of tentimes licking the fame, and not suffering any with his head covered the face of the dead King. of tentimes licking the fame, and not suffering any with his nead covered the large the carkaffe. For which caufe there began to be a reverent opinion of Bird to come neer and touch the carkaffe. Bird to come neer and tout it will fuch time as wife and prudent men, ftudious of the truth, found divinity attributed to the King, until fuch time as wife and prudent men, ftudious of the truth, found out the true cause hereof. For they say that as Bees are generated out of the body of Ozen, and Out the true came nereor. For they say that a do the bodies of men ingender out of their marrow a Drones of Horles, and Hornets of Affes; To do the bodies of men ingender out of their marrow a Berpent, and for this cause the Ancients were moved to confecrate the Dragon to Noble-spirited men, and therefore there was a monument kept of the first Africana, because that under an Olive planted with his own hand, a Dragon was said to preserve his ghost.

anted with his own hand, a pragon was sogether, and therefore I will referve the moral discourse. But I will not mingle fables and truths together, and therefore I will referve the moral discourse. of this Beaft unto another place; and this which I have written, may be sufficient to satisficany rea-fonable man, that there are winged Screents and Dragons in the world. And I pray God that we never have better arguments to fatisfie us, by his corporal and lively presence in our Country, lest fome great calamity follow thereupon. Now therefore we will proceed to the love and hatred of this

Beaft, that is observed with man and other creatures. And first of all, although Dragons be natural enemies to men, like unto all other Serpents, yet many times (if there be any truth in flory) they have been possessed with extraordinary love, both to men, women and children, as may appear by these particulars following. There was one Aleus a Theffallan Neatherd , which did keep Oxen in Offa, hard by the Fountain Hemonim, there was a Dra. gon fell in love with this man, for his hair was as yellow as any gold, unto him for his hair did this Dragon often come, creeping closely as a Lover to his Love : and when he came unto him, he would lick his hair and face fo gently, and in fo fweet a manner, as the man professed he never felt the like, so as without all fear he conversed with him, and as he came, so would he go away again, never returning to him empty, but bringing fome one gift or other, fuch as his nature and kindecould

Ælianus.

There was a Dragon also which loved Pindus the son of Macedo King of Emathia: This Pindus having many Brothers most wicked and lewd persons, and he only being a valiant man of honest dispofition, having likewife a comely and goodly personage, understanding the treachery of his Brethren against him, bethought himself how to avoid their hands and tyranny. Now for a much as he knew that the Kingdom which he possessed, was the only mark they all shot at, he thought it better to leave that to them, and so to rid himself from envy, fear, and peris, then to embrew his hand in their bloud, or to lose his life and Kingdom both together. Wherefore he renounced and gave over the government, and betook himself to the exercise of hunting, for he was a strong man, fit to combate with wilde Beafts, by destruction of whom, he made more room for many men upon the Earth, so that he passed all his days in that exercise. It hapried on a day that he was hunting of a Hind-calf, and spurring his Horse with all his might and main in the eager persuit thereof, he sole out of the sight of all his company, and suddenly the Hind-calf leaped into a very deep Cave, out of the fight of Pindu the Hunter, and fo faved himfelf. Then he alighted from his Horfe, and tyed him to the next Tree, feeking out as diligently as he could for a way into the Cave, whereinto the Hind-calf had leaped: and when he had looked a good while about him, and could finde none, he heard a voyce speaking unto him, and forbidding him to touch the Hind-calf, which made him look about again, to fee if he could perceive the person from whom the voyce proceeded, but espying none, he grew to be afraid, and thought that the voyce proceeded from some other greater cause, and so leaped upon his Horse hastily, and departed again to his fellows. The dayaster he returned to the same place, and when he came thither, being terrified with the remembrance of the former voyce, he durft not enter into the place, but flood there doubting and wondering with himself, what Shepheards or Hunters, or other men might be in that place to diswarnhim from him game, and therefore he went round about to feek for fome, or to learn from whence the voyce proceeded. While he was thus feeking, there appeared unto him a Dragon of a great figure, creeing upon the greatest part of his body, except his neck and head listed up a little, and that list
upages high as the feeting of his body, except his neck and head listed up a little, and that list
upages high as the feeting of was as high as the stature of any man can reach, and in this fashion he made toward Pinder, who at the first fight was not a little afraid of him, but yet did not run away, but rather gathering his mit together, remembred that he had about him Birds, and divers parts of Sacrifices, which inflantly he gave unto the Dragon, and so mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his fury by these gifts, and as it were with a royal solvenged the cruel nature of the mitigated his solvenged his sol changed the cruel nature of the Dragon into kinde usage. For the Dragon being smoothed over with

these glits, & as it were overtaken with the liberality of Pindus, was contented to for fake the old place of his habitation, and to go away with him. Pinder also being no less glad of the company of the Draof his nanitation, and to go away with a state of his hunting, as a deferved price and ransome of his life, and conquest of such a Beast. Neither was he unrequired for it, for Fortune so favoured his game, that whether he hunted fowls of the air, or beafts of the earth, he fill obtained and never mif-fed. So that his fame for hunting procured him more love and honor, then ever could the Imperial Crown of his Countrey. For all young men defired to follow him, admiring his goodly personage and firength, the Virgins and Maids falling in love, contended among themselves who should marry him: the wives for faking their husbands, contrary to all womanly modely, rather defired his company then the fociety of their husbands, or to be preforred among the number of the Goddeffes. Only his Brethren inraged against him, sought all means to kill and destroy him. Therefore they watched all opportunities, lying in continual ambush where he hunted to accomplish their accursed enterprise, which at last they obtained: for as he followed the game, they enclosed him in a narrow firaight neer to a Rivers fide, where he had no means to avoid their hands, they and their company being many, and he alone, wherefore they drew out their swords and slew him. When he faw no remedy but death, he cryed out aloud for help, whose voyce soon came to the ears of the watchful Dragon, (for no Beaft heareth or feeth better) out he cometh from his den, and finding the murtherers standing about the dead body, he presently surprized and killed them, so revenging the quarrel of Pindus, and then fell upon the dead body of his friend, never for faking the cultody thereof, until the neighbours adjoyning to the place, taking knowledge of the fact, came to bury the bodies. But when they came and faw the Dragon among them, they were afraid, and durit not come neer, but stood afar off, consulting what to do till at last they perceived that the Dragon began to take knowledge of their fear, who with an admirable curtefic of nature, perceiving their mourning and lamentation for their dead friend, and withall, their abitinence from approaching to execute his exequies, or funerals, began to think that he might be the cause of this their terror, and far standing off from the dead bodies, wherefore he departed, taking his sarewell of the body which he loved, and so gave them leave by his absence, to beltow upon him an honourable burial, which they performed accordingly, and the River adjoyning, was named by the name of Pin-

By which story may appear, that these savage Dragons are made loving and tame to men, by good turns and benefits bestowed upon them, for there is no nature which may not be overcome by kindenesse. And yet I may not leave this matter thus, nor from these two examples alone, conclude the practile and possibility of love betwixt Men and Dragons : I will therefore add some three or four examples more.

There was a Dragon the lover of Aetholis (as Plutarch writeth) who came unto her every night, and did her body no harm, but gently fliding over her, played with her till morning, then also would he depart away affoon as light appeared, that he might not be espyed. The Maidens friends came to the knowledge hereof, and so removed her far away, to the intent the Dragon might come no moreather: and thus they remained a funder a great while, the Dragon carneftly feeking for the Milden, wandered far and neer to finde her out. At last he met with her, and not faluting her gently Gilliur. as he was wont, flew upon her, binding her hands down with the spire of his body, hissing fostly in herface, and beating gently with his tail her back-parts, as it were taking a moderate revenge upon her, for the neglect of his love by her long absence.

Another like story unto this is reported by Ælianus, of a great Dragon which loved a fair Wo. man, beloved also of a fair Man, the Woman ofcentimes did fleep with this Dragon, but not so willingly as with the Min: wherefore the forfook the habitation of her place for a month, and went away where the Dragon could not find her, thinking that her absence might quench his desire But he came often to the place where he was wont to meet with the woman, and not finding her, returned quietly back again, and came again another time : at last he grew suspicious, and like a lover failing in his expectation, grew very forrowful, and so continued till the month was exspired, every night visting the accustomed place. At last the woman returned, and the Dragon presently met with her, and in an amorous fashion, full of suspicion and jealousie, winding about her body, did beat her as you have heard in the former story : and this (faith Ælianus) happened in Judea, in the days of Heand the King.

There was a little Dragon-whelp bred in Arcadia, and brought up familiarly with a little boy from hisinfancy, until the Boy became a young Man, and the Dragon also became of great stature, so that one of them loved another fo well as Man and Beaft could love together, or rather two playfellows from the Cradle. At last the friends of the Boy feeing the Dragon grow fo great in fo shore. a space, began to be suspicious of him; whereupon they took the bed wherein the Boy and the Dragon were lodged, and carryed the same into a far remote place of Woods and Wildernesse, and there let down the bed with the Boy and the Dragon together. The boy after a little while returned, and came home again to his friends; the Dragon wandered up and down in the Woods, feeding upon berbrand poyfon, according to his nature, and never more cared for the habitation of men, but refted. contented with a folitary life. In the length of time it came to passe that the boy grew to be a persect. min, and the Dragon also remained in the Wood, and although absent one from the other, yet muwilly loving as well as ever. It hapned that this young man travelled through that place where the Diagon was lodged, and fell among theeves, when the young man faw their swords about his gare,

Suctonins.

The History of Serpents.

he cryed out, and the Dragons den being not far off, his cry came to the Dragons ears, who infinity knowing the voyce of his play-fellow, answered the same with another, at whose histing the theres grew afraid, and began to run away, but their legs could not carry them so fast, as to escape the Dragons teeth and claws; for he came speedily to release his friend, and all the theeves that he could find, he put to cruel death then did he accompany his friend out of the place of peril, and returned back he put to cruel death then did he accompany his friend out of the place of peril, and there again to his den, neither remembering wrath, for that he was exposed to the Wildernesse, and there left by his play-fellow, nor yet like perverse men, for saking their old friend in danger.

left by his play-tenow, nor yet the petrote that finde flore of examples in Elianum his fixt and They that defire to read more of this subject, shall finde flore of examples in Elianum his fixt and thirteen Books. To conclude, when Messalina the wife of Claudium, did send certain men to take away the life of Nero, who was a rival of Britannicum; it is said that when they had him in their hands to the life of Nero, who was a rival of Britannicum; it is said that when they had him in their hands to the life of Nero, who was a rival of Britannicum; it is said that when they had him in their hands to the third hands have a Dragon appeared out of the earth, or floor of the chamber, another example of piety hangmen, that they ran away and spared Neroes life. By which example, another example of piety hangmen, that they ran away and spared Neroes life.

In Dragons is observed.

Again, Telephus ignorantly lying with his mother, had committed incest with her, had not a Dragon by divine providence come and parted them as funder: therefore Draconi similar of with indegenously divine providence come and parted them as funder: therefore Draconi similar of with indegenously divine providence come and parted them as fundions of discretion or perfect knowledge, the vertue of discretion or perfect knowledge, is like a Dragon, which diligently searchest all things, and studiously looketh into every chink: so did this Dragon preserve the chastity of the mother and the son, when they ignorantly and in the dark this Dragon preserve the chastity of the mother and the son, when they ignorantly and in the dark that defiled each other, but for his appearance and demonstration. I will add but this one example

more of their love of chastity in men and women.

In Lavinium there was a great holy Wood, neer unto which stood a Temple of Juno, in that wood there was a great deep den of a Dragon, unto the which Dragon the Virgins came every year being blinde-folded with clowts, and carrying Marchpanes in their hands: When they entred the Wood, there was a certain spirit (as it was said) without offence did lead them to the den of the Wood, and so every one of the Virgins did severally offer up their Marchpanes to the Dragon and so every one of the Virgins did severally offer up their Marchpanes to the Dragon received the Marchpane at the hand of every pure Virgin and unspotted, but if they were defiled, and held only the name of Virgins, then the Dragon refused the Marchpane, and therefore they were all examined at their coming forth, that those which had lost their virginity might be punished by the Law. And by this story, (although none but Heathens will ginity might be punished by the Law. And by this story, (although none but Heathens will believe it to be true, because it is a fable meerly invented to defend Idolatry, which with my believe it to be true, because it is a fable meerly invented to defend Idolatry, which with my foul and spirit I do detest) yet I may collect thus much as a moral out of a fable, that Dragons in ancient time did honor Virginity. And thus seeing they neither love, nor are beloved of my other creature, I will here leave to talk of their love and friendship, and passe onto their hatted and adversaries.

The examples before expressed being all extraordinary and beside nature, do not conclude, but that there is an ordinary hatred betwixt Men and Dragons, and therefore in the discourse of their enemies, Men must have the first place, as their most worthy adversary, for both Dragons have perished by Men, and Men by Dragons, as may appear by these stories following. When the Region of Helvetia began first to be purged from noysome Beasts, there was a horrible Dragon sound neer a Countrey Town called Wiljer, who did destroy all men and beasts that came within his danger in the time of his hunger, insomuch that that Town and the fields there to adjoyning, was called Dedwin, that is, a Village of the Wildernesse, for all the people and Inhabitants had forsaken the same, and steed to other places.

There was a man of that Town whose name was Winckelriedt, who was banished for man-slaughter, this man promised if he might have his pardon, and be restored again to his former Inheritance, that he would combate with that Dragon, and by Gods help destroy him: which thing was granted unto him with great joyfulnesse. Wherefore he was recalled home, and in the presence of many people went forth to sight with the Dragon, whom he slew and overcame, whereat for joyhelisted up his sword imbrued in the Dragons bloud, in token of victory, but the bloud distilled down form his sword upon his body, and caused him instantly to fall down dead. And thus this noble Conquetor, a man worthy to be remembredd in all ages and Nations, who had strength to kill the Dragon being alive, yet had no power to resist the venom of his bloud, he being dead. But had it not been that his hand had been before imbrewed in the bloud of a man, I do not believe that the bloud of a that his hand had been before imbrewed in the bloud of a man, I do not believe that the bloud of a bragon could have fallen so heavy upon him. But this is the judgement of GOD, either to punish murder in the same kinde, or elso to teach us, that we should not rejoyce in our own merits, less murder in the same kinde, or elso to teach us, that we should not rejoyce in our own merits, less than the same property. For our Saviour Christ forbade his Disciples that they should rejoyce that the Devils were subject to them; and therefore much lesse may we poor creatures rejoyce for overcoming men or beasts.

And yet one thing more is to be confidered in the death of this man, who was banished for killing a man, and was pardoned for killing a Dragon, and yet killed by the Dragon after the Dragon was slain. Thus bloud was the fin because it brought death, & death again brought bloud to be the revenger of the first, that the bloud of man might be washed away with the bloud of man, and the blood of a Serpent of the first, that the bloud of man might be washed away with the bloud of man, and the blood of a Serpent of the first was a serie grew. Serve the serve of the little of the bloud.

Sanguine successit, sanguine finis erit, as it grew, so shall it end in bloud.

In the days of Philip King of Macedon, there was a way into a Mountain of Armenia, over which the King had prayed, that never man might go but he might die: wherefore Sociate, to try the effect of the Kings prayer, set his Optick Philosophical glasse that he might see what was in

in that way, and presently he perceived two great Dragons, who coming out of their dens, did infeet the air thereabouts with a pethilent evaporation of their own breath. This he declared to the King, who for the revocation of his own prayer, armed divers men to go out against them and kill them: who likewise persormed the same, and so cleared the way from that annoyance. And thus we see another story of Dragons slain by men.

Hereunto may be added, how Hercules, when he was a childe in his cradle, flew two Dragons, as Pindatus relateth. And the Corcyreans did worship Diamedes for killing of a Dragon Donatus a holy Bishop in Germany, finding a Dragon to lie fecretly hid beside a bridge, killing Men, Oxen, Horse, Sheep, and Goats, he came boldly unto him in the name of Christ, and when the Dragon opened his mouth to devour him, the holy Bishop spitting into his mouth killed him.

When Orphess was in hawking, and while he intended his sport suddenly a Dragon set upon him, but his hawking Spaniels or Dogs released him of that Danger, for they tore the Dragon in pieces. Many such other itories I could relate, but I spare them here, because I have handled them in the beginning of this story: and so I passe over the slaughter of Dragons by Men, and come to the slaughter of yen by Dragons, which are briefly these that follow.

Petrus Damianus declareth of a certain husband-man, who rifing early in the morning, and travelliag by the way fide, faw a great Dragon lie still upon the earth without motion, he being weary, thought him to be a trunck of some tree, where fore he sate down upon him, & the beast endured him a little while, but at the last he turned his head in anger, and swallowed him up. After that the Gracians saigned as though they would go away from Troy, and Sinon the Traytor was received by the Irijans into the City, there were two Dragons which slew the sons of Laocoon as they landed in the sland Porcy, Caribea, and Chalidna, which is thus described by Virgil;

At gemini lapfu delubra ad fumma Dracones Effugiunt, favaq: petunt Tritonidos arcem, Sub pedibujque Dea clopeique fub orbe teguntur: Tum verò tremefadia novus per pediora cundi;

Instituat pavor, & scelus expendisse merentem Laoceonia serum:, sacrum qui cuspide robor Laserit, &c.

Which may be Englished thus;
Two Dragons st de, and to the top of Temple flie,
Making their way unto the fort of Tritins serve,
Under the Goddesse seet and spield, in circle down they lie,
What sear did mostal breast possesses on's former sin,
When he did harm the sacred thing by thrusting spear within.

About the Temple of Jupiter Nemeus, there is a Grove of Cypresse trees, among which there is a place wherein a Dragon did destroy Ophelies, when he was laid under a green bush by his Nurse, there is a proverty, Bones viros vel à mure mor deri malis ne Draconem dentes audere admostri: that is to say, every Mouse will bite a good man, but evill men are not touched with the teeth of Dragons. Acidum hath a pretty Emblem, whose title is, Ex arduin perpetuum nomen, from difficult things and great labours, ariseth immortal same: wherein he picture th a Dragon following young Spare rows to take and eat them. His verses in Latine are these:

Crediderat platani ramia (ua pignora passer. El bene, ni sevo visa Dracone forent, Clutiti bio sullos omnes, miseramo; parentem

a passer.
sent,
sent,
sent,
surentem
Sunt longi, cujus fama perennis eat,
Which may be thus Englished:

To Planain-leaves the Sparrow did her young commit, And selections, had not the Dragon them espect, He cat the young ones all, the dath with fins destroyd,

well worthy such a death, of life to be denyed;
This is by Chalcas said, a type of labour long,
Whose same eternal lives in every songue.

There be certain beafts salled Dracontopides, very great and potent Serpents, whose faces are like to the faces of Virgins, and the residue of their body like to Dragons. It is thought that such a one was the Serpent that deceived Eve, for Beda saith, it had a Virgins countenance, and therefore the room facing the likenesse of her own face, was the more easily drawn to believe it into the which when the Devil had entred, they say he raught it to cover the body with leaves, and to shew nothing but the head and face. But this fable is not worthy to be refuted, because the Scripture it self doth directly gainsay every part of it. For first of all it is called a Serpent, and if it had been a Dragon, Mose would have said so, and therefore for ordinary punishment, God doth appoint it to creep upon the belly, wherefore it is not likely that it had either wings or seet. Secondly, it was unpossible and unknew it directly to be be a Serpent, as afterward she consessed of the woman, seeing she knew it directly to be be a Serpent, as afterward she consessed before GOD and her husband.

There be also certain little Dragons called in Arabia, Vessa, and in Catalonia, Dragons of houses, these when they bite, leave their teeth behinde them, so as the wound never scaseth swelling as long as the teeth remain therein, and therefore for the better cure thereof, the taeth are drawn forth, now we will proceed to other creatures.

Aristotle.

Stump stu.

The greatest discord is betwirt the Eagle and the Dragon, for the Vultures, Eagles, Swans and Dragons, are enemies one to another. The Eagles when they shake their wings, make the Dragons, are enemies one to another. gons afraid with their ratling noise, then the Dragon hideth himself within his den, so that he ne. gons arrand with the air, either when the Eagle hath taken away his young ones, and he to re. ver rightetti but it aloft after her, or else when the Eagle meeteth him in her nest, destroying her Egges and young ones: for the Eagle devoureth the Dragons and little Serpents upon earth, and the Dragons again and Serpents do the like against the Eagles in the air. Yea many times the Dragon attempteth to take away the prey out of the Eagles talons, both on the ground and in the sir, to that there ariseth betwixt them's very hard and dangerous fight, which is in this manner defcribed by Nicander.

Hune petit invifum magni Jovie armiger hostem, Cumque genie parat acre fuie ex ethere bellum : · Pascentem in silvie quam primum viderit illum. Quod totes ferm is nides cum mitibus ovis. Et fimul ipfa terens, & vaftans pignora perdat. Non timet hoc Serpens, im's quodam impete dumie Profilient, ipsamque aquilam, leporemque tenellum Extrabit ex rapidie vi fraudeque fortior ungia. Cauta malum declinat avis, fit ibi afpera pugna Ut queat extertam victor fibi tollere pradam. Sed frustra elapsam, & volitantem bino inde voluciem Inlequitur, longos finuum contractus in orbes Obliquoque levans sur sum sua lumina visu.

Which may be Englished thus; When as the Eagle, Joves great Bird, did fee ber enemy, Sharp war in th' air with beak fhe did prepare Gainst Serpent feeding in the Wood, after espy Cause it her Egges and young stercely in pieces tare. The Serpent not assaid of this, leaps out of thorns With sorce upon the Eagle, holding tender Hare, Out of her talons by frand and force more strong, That takes and fnatches despight her enemies fear. But wary Bird avoids the force, and fo they fight amain, That Victor one of them might joy the prey alone, The flying foul by winding Snake is bunted all in vain, Though up and down his nimble eyes this and that way be gone.

In the next place we are to confider the enmity that is betwixt Dragons and Elephants, for fo great is their hatred one to the other, that in Ethiopia the greatest Dragons have no other name but Elephant-killers. Among the Indians also the same hatred remaineth, against whom the Dragons bave many subtile inventions: for besides the great length of their bodies, wherewithall they classe and begitt the body of the Elephant, continually biting of him until he fall downdead, and in the which fall they are also bruised to spieces; for the safegard of themselves they have this device. they get and hide themselves in trees, covering their head, and letting the other part hang downlike a rope: in those trees they watch until the Elephant come to eat and crop of the branches, then fuddenly before he be aware, they leap into his face, and dig out his eys, then do they clasp themselves about his neck, and with their tails or hinder-parts, beat and vex the Elephant, until they have made him breathlesse, for they strangle him with their fore-parts, as they beat them with the hinder, fo that in this combat they both perifh : and this is the disposition of the Dragon, that henever setteth upon the Elephant, but with the advantage of the place, and namely from some high

Sometimes again a multitude of Dragons do together observe the paths of the Elephants, & cross those paths they tie together their tails as it were in knots, fo that when the Elepant cometh along in them, they infnare his legs, and fuddenly leap up to his eyes, for that is the part they aim at above all other, which they speedily pull out, and so not being able to do him any harm, the poor bealt del ivereth himself from present death by his own strength, and yet through his blindenesse received in that combat, he perisheth by hunger, because he cannot choose his meat by smelling, but by his

There is no man living that is able to give a sufficient reason of this contrariety in nature betwirt the Elephant and the Dragon, although many men have laboured their wits, and firained their inventions to finde out the true causes thereof, but all in vain, except this be one that followeth. The Elephants bloud is faid to be the coldeft of all other Beafts, and for this caufe it is thought by moft Writers, that the Dragons in the Summer time do hide themselves in great plenty in the waters where the Elephant cometh to drink, and then fuddenly they leap up upon his ears, because those places cannot be defended with his trunck, and there they hang fast, and fuck out all the bloud of his body, until fuch a time as he poor beast through faintnesse fall down and die, and they being drunk with his bloud, do likewife perish in the fall.

The Gryffins are likewife faid ro fight with the Dragons and overcome them. The Panther allow an enemy unto the Dragons, and driveth them many times into their dens. There is a little Birdal led Capillus, by eating of which the Dragon refresheth himself when he is wearyed in hunting of other beafts. And to conclude, he is an enemy unto all kinde of beafts, both wilde and tame, as may appear by these verses of Lucan, where he saith.

Armentaq; tota fecuti. Rumpitia ingentes amplessi verbere Tauros Neo tutus pacio est Elephas. Which may be Englished thus; And following close the Heards in field, Great Bulls with force of might, And Elephants are made to yeeld By Dragons valiant sprite.

In the next place I will passe unto the poyson and venom of Dragons, omitting all Poetical difcourses about the worshipping and transmutation of Dragons from one kinde to another, such as are the hairs of Orphem, or the teeth of the Dragon which Cadmus flew, into armed men, and fuch like fables, which have no flew nor appearance of truth, but are only the inventions of men, to utter those things in obscure terms, which they were afraid to do in plain speeches.

It is a question whether Dragons have any venom or poyson in them, for it is thought that he hurteth more by the wound of his teeth, then by his poylon. Yet in Deut. 22. Mofes speaketh of them as if they had poylon, faying: Their Wine is as the poylon of Dragons, and the cruel venom of Asps. So also Heliodorm speaketh of certain weapons dipped in the poyson of Dragons. For which cause we are to consider, that they wanting poyson in themselves, become venomous two manner of ways: First by the place wherein they live, for in the hotter Countries they are more apt to do harm then in the colder and more temperate, which caused the Poet in his verses to write of them in this manner following;

> Vos quoqs qui cunciis innoxi numina terris Serpitis aurato nitidi fulgore Dracones, Peftiferos ardens facit Africa: Ducitis alium Aera cum pennis, &c.

Which may be Englished in this manner; You shining Dragons creeping on the earth, Which fiery Africk yeelds with skin like gold, Tet pestilent by hot insetting breath, Mounted with wings in t' air we do behold.

So that which is spoken of the poyson of Dragons insecting the air wherein they live, is to be understood of the Meteor called Draco-volans, a Fire-drake, which doth many times destroy the fruits of the earth, seeming to be a certain burning fire in the air, sometime on the Sea, & sometime on the land, whereof I have heard this credible flory from men of good worth and reputation, happening about some twelve years ago, upon the Western Seas, upon the Coasts of England, which because it is well worthy to be kept in remembrance of all posterity, and containeth in it a notable work of God, I have thought good to fet it down in this place.

There was an old Fisher-man, which with his two hired servants went forth to take fish, according to his accustomed manner and occupation, and having laid their nets, watched them earnostly to finde the booty they came for, and fo they continued in their labour untill mid-night or thereabouts, taking nothing. At last there came by them a Fire-drake, at the fight whereof the old man began to be much troubled and afraid, telling his fervants, that those fights seldom portended any good, and therefore prayed God to turn away all evill from them, and withall, willed his fervants to take up their Nets, lest they did all repent it afterward; for he said he had known much evill follow such apparitions. The young men his servants comforted him, telling him that there was no cause of fear, and that they had already committed themselves into the hands of Almighty GOD, under whose protection they would tarry untill they had taken some fish: the old man rested contented with their confidence, and rather yeelded unto them, then was perswaded by them. A little whileafter the Fire-drake came again, and compaffed round about the Boat, and ran over the Nets, fo that new fears, and more violent passions then before possessed both the old man and his fervants. Wherefore they then refolved to tarry no longer, but hafted to take up their Nets and begone. And taking up their Nets, at one place they did hang fo fast, as without breaking they could not pull them out of the water, wherefore they fet their Grab-hooks unto them to loofe them; for the day before they remembred that a Ship was cast away in the same place, and therefore they thought that it might be the Nets were hanged upon some of the tacklings thereof: and therein they were not much deceived, for it happened that finding the place whereupon the Net didflay, they pulled and found some difficulty to remove it, but at last they pulled it up, and found it to be a chair of beaten gold. At the fight hereof their spirits were a little revived, because they had attained fo rich a booty, and yet like men burdened with wealth, (especially the old man,) conceived new fears, and wished he were on land, left some storm should fall, and lay both it and them the second time in the bottom of the Sea.

So great is the impression of fear, and the natural presage of evill, in men that know but little in things to come, that many times they prove true Prophets of their own destruction, although

they have little reason till the moment of perill come upon them: and so it fell out accordingly in they have little reason the the months of the harms and tempelts on the Sea, it came upon him, but this old man; for whilethe learen death by another way and means. For behold the Devill entred into the hearts of his two servants, and by another way and means. For behold the Deville market into the hearts of his two servants, and by another way and means. For behold the Devil entreu into the nearts of his two fervants, and they conspired together to kill the old mantheir Master, that to between themselves they might be owners of, that great rich chair, the value whereof (as they conceived) might make them Gentlemen, and maintain them in some other Countre at the days of their life. For such was the resolution that they conceived upon the present, that it would not be safe for them to return home again lution that they conceived upon the policy apprehended for murder, as they justly deserved, their after the fact committed, left they should be apprehended for murder, as they justly deserved, their Matter being so made away by them.

after being to made away by them.

The Devill that had put this wicked motion into their mindes, gave them likewise present opportunity to put the same in execution, depriving them of all grace, pity, and piety, still thrusting them forward to perform the same. So that not giving him any warning of his death, one of them in most forward to perform the dashed out his brains, and the other speedily cast him into the Sea. And thus the fear of this old man, conceived without all reason, except superstition for the fight of a Thus the fear of this old man, conceived bloudy manner then he expected: but life suspected it felf and rumors of peril unto guilty consciences, (such as all we moreal men bear) are many times as forcible as the sentence of a Judge to the heart of the condemned prisoner; and therefore it were happy that either we could not fear; except when the causes are certain, or else that we might never perith but upon premonition. And therefore I conclude with the example of this man, that it is not good to hold a superfittious fear, selt God see it, and being angry therewith, bring upon us the evil which we fear. But this is not the end of the ftory, for that Fire-drake, (as by the sequel appeareth)

proved as evill to the servants as he did to the Master.

These two sons of the Devill, made thus rich by the death of their Master, forthwith they failed towards the Coast of France, but first of all they broke the Chair in pieces, and wrapped it up in one of their Nets, making account that it was the best fish that ever was taken in that Net, and so they laid it in one end of their Bark or Fisher-boat. And thus they laboured all that night and the next day, till three or four of the clock, at what time they espyed a Port of Britain, whereof they were exceeding glad, by reason that they were weary, hungry, and thirsty with long labour, always rich in their own conceit by the gold which they had gotten, which had so drawn their hearts from God, as they could not fear any thought of his judgement; And finally it so blinded their eyes, and stopped their ears, that they did not fee the vengeance that followed them, nor hear the cry of their Mafters bloud. Wherefore, as they were thus rejoycing at the fight of land, behold they suddenly elpyed a Man of War coming towards them, whereat they were appalled, and began to think with themselves that their rich hopes were now at an end, and they had laboured for other, but yet resolved to die rather then to suffer the booty to be taken away from them. And while they thus thought, the Man of War approached and hailed them, summoning them to come in and shew what they were: they refused, making forward as fast to the Land as they could. Wherefore the Manof War that certain Muskets at them, and not prevailing, nor they yeelding, fent after them his Longboat, upon the entrance thereof they fought manfully against the affaylants, until one of them was flain, and the other mortally wounded; who feeing his fellow kill'd, and himfelf not likely to live, vet in envy against his enemy, ran presently to the place where the Chair lay in the Net, and lifting the same up with all his might, cast it from him into the Sea, instantly falling down after that fact, as one not able through weaknesse to stand any longer . whereupon he was taken and before his life left him he related the whole ftory to them that took him, earneftly defiring them to fignife fo much into England, which they did accordingly and as I have heard, the whole flory was printed, and so this second History of the punishment of murder, I have related in this place, by occafion of the Fiery-drake, in the History of the Dragon.

A second cause why poyson is supposed to be in Dragons, is for that they often feed upon many venomous roots, and therefore their poyfon flicketh in their teeth, whereupon many times the party bitten by them, seemeth to be poyfoned; but this falleth out accidentally, not from the nature of the Dragon, but from the nature of the meat which the Dragon eateth. And this is it which Human knew and affirmed in his verses, when he described a Dragon making his den neer unto the place where many venomous roots and herbs grew, and by eating whereof he greatly annoyeth mankings

when he biteth them.

Os de Drakoon espi Xein oresteros andra menese Bebrocos kaka pharmaka.-Which may be thus Englished, And the Dragon which by men remains, Eats evill herbs without deadly pains.

And therefore Elianu faith well, that when the Dragon meaneth to do moft harm to men, he eateth deadly poysonful herbs, so that if he bite after them, many not knowing the cause of the poylon, and seeing or feeling venom by it, do attribute that to his nature which doth proceed from his meat. Besides his teeth which bite deep; he also killeth with his tail, for he will so begirt and pinch in the body, that he doth gripe it to death, and also the frokes of it are fo ftrong, that either they kill thereby forthwith, or elfe wound greatly with the fame, fo

write thus; Nec tamen illegraves, ut catera turba, dolores (Qui ceu rodentes nochu queque obvia muris)

Si velit, infixo cum forte momorderit ore, Suscitat : exigum non noxià vulnera punctus Which may be thus Englished;

Infligit modicum tenuis dat plaga cruorem.

Not yet be when with bis angry mouth Doth bite, such pains and torments bringeth As other Serpents, if Ancients tell the truth. When with his teeth and spear be stingeth :

For as the holes which biting Mice do leave. When in the night they light upon a preys So small are Dragons-bites which men receive. And barmleffe wound makes bloud to run away.

Their mouth is small, and by reason thereof they cannot open it wide to bite deep, so as their bi- Actius. ting maketh no great pain ; and those kinde of Dragons which do principally fight with Eagles, are Grevin. defended more with their tails then with their teeth: but yet there are some other kinde of Dra- Auicea, gons, whose teeth are like the teeth of Bears, biting deep, and opening their mouth wide, wherewith gons, whole the state of this kinde bite deeper then the females, yet there followeth no great pain upon the wound.

The cure hereof is like to the cure for the bicing of any other Beaft wherein there is no venom, and for this cause there must be nothing applyed thereunto which cureth venomous bitings, but rather fuch things as are ordinary in the cure of every Ulcer.

The feed of graffe, commonly called Hay-duft, is prescribed against the biting of Dragons. The Barble being rubbed upon the place where a Scorpion of the earth, a Spider, a Sea or Land-dragon biteth, doth perfectly cure the fame. Also the head of a Dog or Dragon which bath bitten any ones being cut off and flayed, and applyed to the wound with a little Eupharbium, is faid to cure the wound

And if Albidifimon be the same that is a Dragon, then according to the opinion of Avicen, the cure of it must be very present, as in the cure of Ulcers. And if Albair of and Haudem be of the kinde of Dragons, then after their biting there follow great coldnesse and stupidity; and the cure thereof must be the same means which is observed in cold poysons. For which cause the wound or place bit. ten, must be embrewed or washed with luke-warm Vinegar, and emplaistered with the leaves of Bay, anointed with the Oyl of herb-Mary, and the Oyl of Wilde-pellitory, or fuch things as are drawn out of those Oyls, wherein is the vertue of Nettles, or Sea-onions.

But those things which are given unto the patient to drink, must be the juyce of Bay-leaves in Vinegar, or else equall portions of Myrrhe, Pepper, and Rew in Wine, the powder or dust whereof must be the full weight of a golden groat, or as we say a French Crown.

In the next place, for the conclusion of the History of the Dragon, we will take our farewell of him in the recital of his medicinal vertues, which are briefly these that follow.

First, the fat of a Dragon dryed in the Sun, is good against creeping Ulcers : and the same mingled with Honey and Oyl, helpeth the dimnesse of the eyes at the beginning. The head of a Dragon keepeth one from looking asquint : and if it be set up at the gates and dores, it hath been thought inancient time to be very fortunate to the fincere worshippers of GOD. The eyes being kept till they be stale, and afterwards beat into an Oyl with Honey made into Ointment, keep any one that useth it from the terrour of night-visions and apparitions.

The fat of a Hart in the skin of a Roc, bound with the nerves of a Hart unto the shoulder, was thought to have a vertue to fore-shew the judgement of victories to come. The first spindle by bearing of it, procureth an easie passage for the pacification of higher powers. His teeth bound unto the feet of a Roe, with the nerves of a Hart, have the same power. But of all other, there is no folly comparable to the composition which the Magitians draw out of a Dragon to make one invincible, and that is this: They take the head and tail of a Dragon, with the hairs out of the fore-head of a Lyon, and the marrow of a Lyon; the spume or white mouth of a conquering Horse, bound up in a Hirts skin, together with a claw of a Dog, and fastned with the crosse nerves or sinew of a Hart, or of a Roc; they say that this hath as much power to make one invincible, as hath any medicine or

The fat of Dragons is of such vertue that it driveth away venomous beafts. It is also reported, that by the tongue or gill of a Dragon fod in Wine, men are delivered from the spirits of the night, called Incubi and Succubi, or else Night-mares. But above all other parts, the use of their bloud is accounted most notable. But whether the Cynnabaria be the same which is made of the bloud of the Dragons and Elephants, collected from the earth when the Dragon and Elephant fall down dead together, according as Pliny delivereth, I will not here dispute, seeing it is already done in the story of the Elephant: neither will I write any more of this matter in this place, but only refer the Reader unto that which he shall finde written thereof in the History of our former Book of Four-

And if that fatisfie him not, let him read Langim in the first book of his Epistles, and fixty five Epifile, where that learned man doth abundantly fatisfie all men concerning this question, that are fludious of the truth, and not prone to contention. And to conclude, Andreas Balvacenfis writeth that the Bloud ftone called the Hamaitte, is made of the Dragons bloud : and thus I will con-

Vincensius. Solinus.

clyde

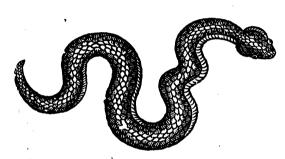

clude the History of the Dragon, with this story following out of Porphyrim, concerning the good fuccesse which hath been fignified unto men and women, either by the dreams or fight of Dra.

Mammea the Mother of Alexander Severus the Emperor, the night before his birth, dreamed that the brought forth a little Dragon, fo also did Olympia the Mother of Alexander the Great, and Pom. ponta the Mother of Scipio Africanue. The like prodigy gave Augustus hope that he should be Empe ror. For when his Mother Aetia came in the night time unto the Temple of Apollo, and had feetdown her bed or couch in the Temple among other Matrons, suddenly the fell asleep, and in her sleep the her bed or couch in the 1 emple attorned the her body, and fo departed without doing her dreamed that a Dragon came to her, and clasped about her body, and so departed without doing her any harm. Afterwards the print of a Dragon remained perpetually upon her belly, so as the never durst any more be seen in any bath.

The Emperor Tiberius Cafar, had a Dragon which he daily fed with his own hands, and nourifhed like good fortune, at the last it happened that this Dragon was defaced with the biting of Emmets like good fortune, at the last it happened that the wherefore the Emperor grew greatly amazed thereat, and demanding a reason thereof of the Wisemen, he was by them admonished to beware the infurrection of the common people. And thus with these stories representing good and evil

by the Dragon, I will take my leave of this good and evill Serpent.

of the DRYINE.

Here be some that confound this Serpent with the Water. fnake, and fay it is none other then that which of ancient time was called Hydrus, for fo long as they live in the water, they are called Hydri, that is, Snakes of the water, but when once they come to the land, they are called Chelidri, and Cherfidii : but it is certain that the Chelidrus, is differ. ent from the Cherfydrm, by the ftrong fmell and favour which it carryeth with it wherefoever it goeth, according to these verses made of Umbo the Priest in Virgil.

Viperio generi & graviter fpirantibus Hydris, Spargere qui somnos cantuq; manuq; solebat. Which may be Englished thus; Who could by fong and hand bring into deadly fleep All kinde of Vipers, with Snakes smelling strong and deep.

Which being compared with that instruction which he giveth to Shepheards, teaching them how to drive away the strong smelling Serpents from the folds, he calleth them Chelydri, when he writeth in this manner;

> Disce & odoratam stabulis accendere Cedrum, Galbanioq; agitare graves nidore Chelydros. That is to fay in English thus; Learn how to drive away strong smelling Chelyders From folds, by Galbanum and lavoury Cedars.

So that it is clear that these Dryines are the same which are called Ghelydri, who do sink on the face of the earth, whereby they are oftentimes disclosed although they be not seen : howbet, some think that this filthy favour doth not proceed from any fume or fmoak coming out of their bodies, but rather from their motion, according to the opinion of Macer in these following verses.

> Seu terga expirant spumantia Virus Seu terra fumat qua teter labitur Anguis. Which may be Englished in this manner: Whether their foming backs that smell Do send abroad such poyson pestilent, Or whether the earth whereon this Snake full fell Doth flide, yeelds that unwholesome fent.

It is faid that these Dryines do live in the bottom or roots of Oaks, where they make their nells. for which cause they be called Quercult, as if they were derived from an Oak, which caused the Countrey people to call it Dendrogailla, which fignifieth the male and female in this kinde: being bred only in one part of Africk, and in Hellespont, and there be of them two kindes, one of the length of two cubits, being very fat and round, and very sharp scales over the back; and they are called Druing of Drus, that fignifieth an Oak, because they live in bottom of Oaks: and they are also called Chelydri, because of their sharp skins or scales, for it is the manner of the Latines and the Greis the best of the hard and rough skin of the body of man and beaft, by the name of Cheydra: and Isake the Serpents Cylmdri, to be the same that the Dryines be. Within the scales of this Serpent there are bred certain Plyes with yellow wings, as yellow as any Brasse, the which Flyes at length do eat and destroy the Serpent that breedeth them. The colour of their back is blackish, and not white as some have thought, and the savour or smell coming from them like to the smell of a Horses. hide, wet as it cometh out of the pit, to be shaven by the hand of a Tawyer or Glover. And Bellomill writeth, that he never faw any Serpent greater then this Dryine, which he calleth Dendrozailla. nor any that hisseth stronger; for he affirmeth, that one of these put into a sack, was more then a strong Countreyman could carry two miles together without setting it down and resting. And likewise he saith, that he saw a skin of one of these stuffed with hair, which did equall in quantity the leg of a great man. The head of this beaft is broad and flat, and Olam Magnus writeth, that many times and in many places of the North, about the beginning of Summer these Serpents are found in creat companies under Oaks, one of them being their head or Captain, who is known by a white creit or combon the top of his crown, whom all the refidue do follow, as the Bees do their King and Captain. And these by the relation of old men are thought to beget a certain stone, by their mutable breathing upon some venomous matter, found in the trees leaves, or earth where they abide: For they abide not only in the roots, but in the hollow bodies of the trees, and fometimes for their meat and food, they leave their habitation, and descend into the Fens and Marishes to hunt Frogs: and if at any time they be affaulted with the Horse-flie, they instantly return back again into their former habitation. When they go upon the earth, they go directly or straight, for if they should winde themselves to run, they would make an offensive noise, or rather yeeld a more offensive smell : according to these verses of the Poet Lucan :

Of the Dryine,

Natrix & ambigue coleret qui Syrtidos arva Chersidros, tractiq; via fumante Chelydri.

In English thus :

The Snake which hant the doubtful Syrtes fands. And Chelyders by fliding fume on lands.

Georgius Fabricius writeth, that he saw in the Temple of Bacchus at Rome, a company of drunken men dancing, leading a male Goat for factifice, having Snakes in their mouths, which Snakes Prudentim the, Christian poet calleth Chlydri, that is, Dryines in these verses following;

> -Baccho caper omnibus aris Ceditar . & virides discindant ore Chelydros. Qui Bromium placare volunt, quod & ebria jam tum Ante oculos regis Satyrorum infania ficit.

In English thus:

A Goat to Bacchus on every altar lies, While facrificers tear Dryines in pieces [mail By force of teeth, and that before the eyes Of Satyres King, mad drunk they fall.

The nature of this Serpent is very venomous and hot, and therefore it is worthily placed among the first degree or rank of Serpents, for the smell thereof doth so stupifie a man, as it doth near frangle him, for nature refuseth to breath, rather then to draw in such a filthy air. And so pestilene a the nature of this Beaft, that it maketh the skin of the body of a man hurt by it, loofe, flinking, and rotten, the eyes to be blinde and full of pain, it restraineth the urine, and if it come upon a man deeping, it causeth often neezing, and maketh to vomit bloudy matter. If a man tread upon it unawares, although it neither sting nor bite him, yet it causeth his legs to swell, and his foot to lose the skin thereof: and that which is more strange, it is reported, that when a Physitian cured the hand of one bitten by this Serpent, the skin of his hand also came off, and who oever killeth one of thele, if once he smell the savour of it, whatsoever he smelleth afterwards, he still thinketh it smelleth of the Dryine. And therefore most pestilent must this Serpent needs be, which killeth both touching and imelling.

When it hath wounded or bitten, there followeth a black or red swelling about the fore, also a vehement pain over all the body through the speedy dispersing of the poyson; also Bufules or little wheals, madnesse, drinesse of the body, and intolerable thirst, trembling and more tification of the members wounded, whereof many die. The cure is like to the cure of Vipers, and

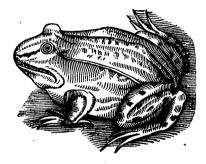

besides it is good to take Hart-wort drunk in Wine, or Trifoly, or the roots of Dassadil. Acorns of all kinde of Oaks, are profitable against this poyson, being beaten to powder and drunk. And thus much shall suffice for this Serpent.

of the Serpents called E L E P HANTS.

Here be also Serpents called Elephants, because whomsoever they bite, they infect with a kinde of leprosie, and I know not whether the Serpent Elops, Elopis, and Laphian be the same, but because I finde no matter worthy in them to be spoken of, and they are strangers in our Countrey, the Reader must be contented with their bare names without further description.

of FROGS.

Rogs are called by the Hebrews, Zab, Zephardea, Urdeana, and Urdea Akruka, and Masker; by the Arabians, Hardun, Difdab, Dijphoa, Difdapha, Altabaul; by the Grecians, Batrachos: whereof cometh the corrupted word Bracketes, and Garazum. Lalages and Kembroie, fignifieth green Frog: the Italians and Spaniards call it Rana, by the Latine word; the French, Grenoville; the German, Frofit. and Frojche, and Graffrech, for a green Frog. The Flemings, Vrojch, and Vruesch, and Pivit; the Illnians and Polonians, Zaba, by a word derived from the Hebrew. It is some question from whence the word Rana is derived, and because of much controversie whether it hath received name, because it liveth on the land and in the water, or from the croaking voyce which it useth: I will not trouble the English Reader with that discourse, only I am affured, that the word Frog in English, is derived from the German word Frojch, as many other English words are derived besides the common name of many Frogs. Homer in his Comedy of the figher betwixt Frogs and Mice called Batrachomyomachia, hath devited many proper names for Frogs, fuch as thefe are; Limnechavie, Gracedies, Pleus, Daltliver ; Hydromedoufa, Water-hunter ; Phofignathos, Nature-cryer ; Hypfiboas, Loud-cryer : Linibain, Love-liver ; Poluphonos, great Labourer ; Krambophagos, Brasil-eater ; Lymnesios, Pool-keeper ; Kiliminthios, Mint-eater ; Hydrocharn, Water-childe ; Borborokoites, Noise-maker ; Prasjaphagos, Grass-eater; Peloufios, duft creeper; Pelobates, duft-leaper; Kramgafides, drought-hater ; Praffaios, Graffe green: and fuch other like, according to the witty invention of the Author, all which I thought good to name in this place, as belonginging to this History.

In the next place we are to consider the diversity and kindes of Frogs, as they are distinguished by the place of their abode: for the greatest difference is drawn from thence; some of them therefore are Water-frogs, and some are Frogs of the land: the Water-frogs live both in the water and on the land, in marishes, standing pools, running streams, and banks of Rivers, but never in the Sea; and therefore Rana Marina is to be understood of a Fish, and not a Frog, as Massarius bath learnedly proved against Marcellus. The Frogs of the land are distinguished by their living in Gardens, in Meddows, in hollow Rocks, and among fruits: all which several differences shall be afterwardespressed, with their pictures in their due places: here only I purpose to talk of the vulgar and common Frog, whose picture with her young one is formerly expressed. Beside, these differ in generation: for some of them are engendered by carnal copulation, and of the slime and rottennesses of the are of a green colour, and those are eaten in Germany and in Flanders; some again are yellow, and some of an Ash-colour, some spotted, and some black, and in outward form and sashion they resemble a Toad, but yet they are without venom, and the semale is always greater then the male: when the Egyptians will signifie an impudent man, and yet one that hath a good quick sight, they picture a Frog, because he liveth continually in the mire, and hath no bloud in his body, but about hisese.

The tongue is proper to this kinde, for the fore-part thereof cleaveth to the mouth, as in a fine, and the hinder part to the throat, by which he fendeth forth his vove: and this is to be underflow, that all Frogs are mute and dum, except the green Frogs, and the Frogs of the water, for the have voves. And many times the vovces of Frogs proceedeth from the nature of the Countries wherein they

they live: for once all the Frogs, in Macedonia and Gyrenia, were dum, until there were some brought thicker out of some other Countries, as at this day the Frogs of Stripbin are all dum, whereupon came the Proverb, Batrachos ec Sariphon, A Frogs of Stripbin, because the Frogs of that Countrey do never croak, although you carry them into any other Countrey.

This scripbs is one of the Islands of the Sporades in Greece, wherein is the lake talled Pierise, which doth not run in the Summer, but only in the Winter, and all the Progs which are cast into that lake, are perpetually silent, and never utter their voyce; whereof there are affigned two causes, one fabulous, and the other true and natural. The first the Seriphsons say, that when Perseur returned with the head of Medusa, having gone very far till he was weary, said him down beside that lake to sleep, but the croaking Frogs made such a noise, as he could take no rest: Whereat Perseus was much ostended, and therefore prayed Jupiter to sorbid the Frogs from crying, who instantly heat d his prayer, and injoyned perpetual silence to the Frogs in that water; and this is the fabulous reason, being a meet siction of the Poets.

The second and more true reason is that of Thiophrastus, who saith, that for the coldnesse of the water, the Frogs are not able to cry in that place. The voyce of Frogs is said by the Latinists to be Caxing, and by the Greians, Obiagon; peculiar words to set forth this crying: now because their tongue cleaveth to the palat of their mouth, and their voyce protected but from their throat to their mouth, and the spirit is hindered by the tongue, so as it cannot proceed directly; therefore it hath two bladders upon either side of the mouth, one which it filleth with winde, and from thence proceedeth the voyce. Now when it croaketh, it putteth his head out of the water, holding the near ther lip even with the water, and the upper lip above the water; and this is the voyce of the male provoking the senale to carnal copulation.

They have but very small.lungs, and those without bloud, sull of froth like to all other creatures of the water, which do lay egges, and for this rause they do never thirst: wherefore also Sea-calves and Frogs are able to live long under the water. They have a double Liver; and a very small mile, their legs behinde are long, which maketh them apt to leap; before they are shorter, having divided claws which are joyned together with a thin broad skin, that shaketh them more apt to swim. The most place of their abode is in sens, or in warm waters, or in sinh-pools; but yellow and ash-coloured Frogs abide in Rivers, Lakes, and standing Pools, but in the Winter time they all hide themselves in the earth. And therefore it is not true that Pliny saith, that in the Winter time they are reloved into slime, and in Summer they resume again their first bodies, for they are to be seen many times in the Winter; especially in those waters that are never frozen, as Agretoland Mathiolia hath soundly observed, and they have been seen in certain running streams, holding small fishes in their mouths, as were sucking meat out of them.
